OBJECTIVE PART

LESSON 19

1. What is phonation a technical term used to describe?

- a) Position of the larynx
- b) The shape of the glottis
- c) The process of breathing
- d) Forms of vocal cord vibrations

2. What is the process commonly known as voicing?

- a) Forms of vocal cord vibrations
- b) The shape of the glottis
- c) Production of speech sounds

d) Position of the larynx

3. What is "phonation"?

a) Singing

b) Any vocal activity in the larynx

c) A whistle came through his lips

d) The sound of speech produced by the vocal cords

4. How are consonant sounds described based on the position of the vocal cords?

a) As a fricative or stop

b) As suctioned or non-suctioned

c) Like velar or alveolar

d) Like voiceless or voiced

5. What are the main phonation activities during vibration of the vocal cords?

a) Whispering and shouting

b) Breathy and raspy voice

c) Coughing and sneezing

d) Voting or phoning

6. What creates differences in intensity, frequency and sound quality during phonation?

a) Environment

b) Tongue and lip movement

c) Modifications in phonation due to changes in the length, thickness and tension of the vocal cords

d) Air pressure in the lungs

7. What is the glottis?

a) Nasal cavity

b) External ear canal

c) The space between the vocal cords in the larynx

d) Trachea

8. What determines the states of the glottis?

- a) The temperature of the air passing through the vocal cords
- b) Vocal cord color
- c) Larynx size
- d) Possibilities of the nature of vibrations

9. What is the cause of the fricative noise found in the whisper and glottal fricative /h/?

- a) A narrow opening between the vocal cords
- b) A wide opening between the vocal cords
- c) Incorrect alignment of the vocal cords
- d) The vocal cords vibrate slowly

10. Which type of phonation is characterized by the folds being open from each other and air passing freely through the glottis?

- a) Unvoiced
- b) he whispered
- c) Pressed
- d) Vocal Fry

11. What is expression?

- a) The act of speaking aloud
- b) An important property of speech sounds used to describe and distinguish sounds
- c) Using hand gestures when speaking
- d) Nasal voice quality

12. What is a raspy voice?

- a) When the vocal cords are apart but still vibrating
- b) When the folds are close together and there is vibration
- c) When there is a slight opening in the front and the arytenoid cartilages are close together
- d) When the vocal cords vibrate breathlessly

13. Which sounds are usually pronounced?

- a) liquids and gliders
- b) vowels, nasals and approximants
- c) fricatives and plosives
- d) sibilants and affricates

14. What are the most commonly found sounds that have both voiced and voiceless sounds?

- a) obstacles
- b) sonorants
- c) shock
- d) consonants

15. What is the symbol for shock?

- a) /ð/
- b) [ʔ]
- c) /h/
- d) /θ/

16. Which book contains chapter 6 dealing with this topic?

- a) The Elements of Style by William Strunk Jr.
- b) English Phonetics and Phonology - A Practical Course by Peter Roach
- c) Oxford English Dictionary
- d) A course in phonetics by Peter Ladefoged and Keith Johnson

17. What is phonation?

- a) Movement of the larynx during speech production
- b) The process of shaping speech sounds using the vocal cords
- c) Study of phonetics and phonology
- d) Modification of speech sounds in different registers

18. Which term is synonymous with phonation?

- a) Voting

- b) Articulation
- c) Resonance
- d) Pronunciation

19. What determines the states of the glottis?

- a) Position of the larynx
- b) The shape of the vocal cords
- c) Intensity and frequency of sound
- d) Contact between the vocal cords

20. What is the main difference between voiced and voiceless sounds?

- a) Loud sounds are produced with greater intensity.
- b) Voiceless sounds are produced with a wider stroke.
- c) Voice sounds include vibrations of the vocal cords.
- d) Voiceless sounds have a higher pitch.

CODE: ENG507

SUBJECTIVE PART

LESSON 19

1. What is phonation and how is it related to the glottis?

ANS: Phonation is a technical term used to describe the forms of vibration of the vocal cords in the production of speech sound, commonly known as articulation. The glottis is the space between the vocal cords and can take on a variety of shapes such as voiced, voiceless, mumbled and squeaky positions, which is important in describing speech sounds.

2. What is phonation?

ANS: Phonation refers to any vocal activity in the larynx (soundbox) and is a general term used in phonetics.

3. What is phonation and why is it important to study the types of phonation?

ANS: Phonation is the main phonation activity involving the vibration of the vocal cords that produces voiced, voiceless, breathy and squeaky voice. Some phoneticians also include modifications in phonation that arise from variations in the length, thickness, and tension of the vocal cords displayed in different registers of speech, which play an important role in speech, including voicing and mumbling. The study of different types of phonation helps to understand the different laryngeal possibilities and their effect on the different intensity, frequency and quality of the sound produced during speech.

4. How does variation in the states of the glottis affect vocal characteristics such as pitch, loudness, and voice quality?

ANS: The states of the glottis determine the nature of the vibrations that result in differences in pitch, loudness, and voice quality. The vibrations can change in many ways, resulting in the production of fricative sounds like the /h/ found in whispers or stop fricatives when a narrow opening is created between the vocal cords. Most voiceless consonants have a wider open glottis.

5. What is the meaning of expression in speech sounds?

ANS: Articulation is important not only as a property but also as a resolution for describing sounds. Voiced and voiceless sounds can make a phonemic distinction, meaning that the meaning of a word can change if you use a voiceless sound instead of a voiced sound.

6. What is a stroke and when is it used in RP?

ANS: Ráz is an allophonic variation used in RP before /p/, /t/, /k/ and can completely replace these sounds in some dialects. It is represented by the symbol [ʔ].

7: What is the role of the larynx in speech production?

ANS: The larynx, also known as the voice box, plays an important role in speech production by containing the vocal cords and influencing the production of speech sounds.

8: What is phonation and how is it related to articulation?

ANS: Phonation refers to any vocal activity in the larynx and is closely related to the voice. Phonation involves the vibration of the vocal cords as air passes, resulting in the production of voiced sounds.

9: What are the different states of the glottis and how do they affect speech sounds?

ANS: The glottis, which is the space between the vocal cords, can occupy different positions, leading to different states of the glottis. These states, such as voiced, voiceless, breathy, and raspy, modify the form and properties of speech sounds, including pitch, loudness, and voice quality.

10: How does speaking contribute to distinguishing sounds in different languages?

ANS: Voice is an important feature of speech sounds that can serve as a distinction between sounds in different languages. For example, using a voiced sound instead of a voiceless sound can change the meaning of a word in languages such as English. Voice plays a key role in phonemic distinctions and can affect the overall meaning and perception of words.

CODE: ENG507

OBJECTIVE PART

LESSON 20

1. What is VOT in linguistics?

A) The delay between release of a plosive and the onset of voicing ✓

- B) The point at which vocalfold vibration stops
- C) The sound produced after a voiced consonant
- D) The time taken to release a plosive
- E) The amount of air expelled while pronouncing a plosive

2. Which type of plosive has a delay or lag before the onset of voicing?

- A) Voiced consonant
- B) Unvoiced fricative
- C) Unvoiced aspirated plosive
- D) Fully voiced plosive
- E) Unvoiced unaspirated plosive ✓

3. What does the VOT scale represent?

- A) The duration of vowel articulation after plosive release
- B) The intensity of plosive sound
- C) The timing of the voicing in relation to the consonant articulation ✓
- D) The strength of airflow during plosive articulation
- E) The pitch of the following vowel sound

4. Why is VOT an important feature in experimental phonology?

- A) It provides information about the duration of vowel sounds
- B) It provides information about the strength of aspiration in plosives
- C) It helps in determining the correct pronunciation of plosives

D) It is important for bilingual learners to differentiate sounds in different languages

E) It helps in analyzing the nature of different languages and their stop sounds ✓

5. What are the three types of VOT?

A) Aspirated, nasalized, and fricative

B) Unaspirated voiceless, aspirated voiceless, and voiced with negative VOT ✓

C) Fortis, lenis, and unreleased

D) Unvoiced, voiced, and whisper

E) Voiced, voiceless, and creaky

6. Which language has strongly aspirated stops with a VOT lasting twice as long as that in English?

A) Mandarin

B) French

C) German

D) Spanish

E) Navajo ✓

7. Which of the following is true regarding the VOT of an English stressed initial /p/?

A) It has no VOT

B) It has a positive VOT

C) It has a VOT of 50-60 MS ✓

D) It has a VOT lasting twice as long as that of Navajo

E) It has a negative VOT

8. What does a negative VOT mean for a voiced stop?

- A) The voicing and the release of the stop happen at the same time
 - B) The voicing is delayed after the stop is released
 - C) The voicing depends on the amount of aspiration
 - D) The vocal cords start vibrating after the stop is released
 - E) The vocal cords start vibrating before the stop is released ✓
-

9. What is the practical measure of aspiration?

- A) The strength of airflow during plosive articulation
 - B) The intensity of plosive sound
 - C) The duration of vowel articulation after plosive release
 - D) The pitch of the following vowel sound
 - E) The duration of VOT ✓
-

10. What is the purpose of language-specific VOT values?

- A) To determine the correct pronunciation of plosives
 - B) To analyze the nature of different languages and their stop sounds ✓
 - C) To provide information about the duration of vowel sounds
 - D) To compare languages based on vowel articulation
 - E) To provide information about the strength of airflow during plosive articulation
-

11. What is the most common type of consonant distinguished using the voicing feature?

- a) Fricatives
- b) Plosives (stops)
- c) Approximants
- d) Nasals

12. Why is the timing of voicing in relation to the consonant articulation important?

- a) To modify the vowel sound
- b) To indicate stress on the syllable
- c) To distinguish between voiceless and voiced consonants
- d) To determine the pitch of the consonant

13. What is the scientific measure of voice timing called?

- a) Breath control
- b) Articulation pause
- c) Voice onset time (VOT)
- d) Speech delay

14. What is the name given to the delay in the voicing of a plosive?

- a) Aspiration
- b) Enunciation
- c) Inflection
- d) Contraction

15. What does VOT stand for in phonetics?

- a) Voice Onset Time
- b) Vibration Observation Technique
- c) Voice Open Test
- d) Vocal Fold Time

16. Which type of plosive sounds is characterized by a delayed start of vocal fold vibration?

- a) Voiceless sound
- b) Voiceless aspirated sound
- c) Fricative sound

d) Voiced sound

17. What is the delay called before voicing starts in a voiceless unaspirated plosive?

- a) Voice Onset Time (VOT)
- b) Phonation Delay (PD)
- c) Aspiration Time (AT)
- d) Sound Onset Time (SOT)

18. What is VOT used for in experimental phonology?

- a) To study the relationship between language and thought
- b) To study the vowel sounds in different languages
- c) To analyze the impact of accent on language learning
- d) To analyze the nature of different languages and their stop sounds

19. What does VOT stand for?

- a) Vocal Over Tonal
- b) Vowel Opposite Tone
- c) Voice Onset Time
- d) Verb Order Tendency

20. Why is VOT important to consider for bilingual learners?

- a) It is not important for bilingual learners
- b) It provides an insight regarding the perception of VOT by bilingual learners
- c) It is useful only for language experts
- d) It is important for monolingual learners only

21. What type of voiceless stops have a voice onset time near zero?

- a) Voiced stops
- b) Simple unaspirated voiceless stops
- c) Aspirated voiceless stops
- d) Voiceless aspirated stops

22. What is the normal value of VOT for stressed initial /p/ in English?

- a) Between 50 and 60 MS

- b) Exactly 70 MS
- c) More than 100 MS
- d) Less than 30 MS

23. What is the term used for when the voicing of a following vowel begins at or near to when the stop is released?

- a) long VOT
- b) zero VOT
- c) negative VOT
- d) positive VOT

24. The length of VOT in aspirated stops indicates what?

- a) voicing of a following vowel
- b) how clear the articulation is
- c) duration of the stop
- d) strength of aspiration

CODE: ENG507

SUBJECTIVE PART

LESSON 20

1. What is the timing of voicing in relation to consonant articulation and what is aspiration?

The timing of voicing in relation to consonant articulation is important in analyzing VOT in different languages, and aspiration refers to when the beginning of full voicing does not happen until some time after the release of the stop (usually voiceless).

2. What is Voice Onset Time (VOT) and how is it measured in relation to the production of explosive sounds?

Voice Onset Time (VOT) is the point in time at which vocal fold vibration starts in relation to the release of a closure during the production of explosive sounds. VOT is measured using three types of explosive sounds: voiced, voiceless, and

voiceless aspirated sounds. Congruence or non-congruence between VOT observed suggested varying rates of performances and other related behaviors.

3. Why is VOT an important feature for experimental phonology?

VOT is important for experimental phonology because it helps analyze the nature of different languages and their stop sounds. Languages vary in terms of VOT, and the delay (lag or VOT) is an important feature to be explored for the comparison of languages.

4. Why are language-specific VOT values important to consider, according to the context provided?

Language-specific VOT values must be analyzed by language experts because they can provide insight into the phonemic contrast of appropriate sound production by bilingual learners, and there are different possibilities/tendencies that occur in different languages, which should be indicated reference to a scale of oppositions among stop consonants.

5. What are the three possible types of VOT based on the nature of stop sounds?

The three possible types of VOT based on the nature of stop sounds include simple unaspirated voiceless stops, aspirated stops followed by a vowel called positive VOT, and the length of VOT in such cases is based on the practical measure of aspiration.

6. What is negative VOT and how does it affect the vocal cords?

Negative VOT is when voiced stops have a VOT noticeably less than zero, meaning that the vocal cords start vibrating before the stop is released. This means the vocal cords start vibrating earlier than they should, but it's still technically a "stop."

7. What is VOT?

VOT refers to the point in time at which vocal fold vibration starts in relation to the release of a closure during the production of plosive sounds.

8. What are the three types of plosive sounds, and how do they differ in terms of VOT?

The three types of plosive sounds are fully voiced, voiceless unaspirated, and voiceless aspirated. In fully voiced plosives, vocal folds vibrate throughout, in voiceless unaspirated plosives there is a delay before voicing starts, and in voiceless aspirated plosives, the delay is much longer, depending on the amount of aspiration.

9. How is VOT calculated?

VOT is calculated through a specific methodology and important contrastive features are to be taken into account.

10. In what way does VOT vary across languages?

Different languages choose different points along the VOT continuum in forming oppositions among stop consonants. VOT values vary depending on language and the delay (lag or VOT) is an important feature to be explored for the comparison of languages.

11. How does Navajo aspirated stops compare with other languages in terms of VOT?

The Navajo aspirated stops have a very large VOT value that is quite exceptional (150 MS), this is longer than the normal value for the VOT of English stressed initial /p/ which are between 50 and 60 MS.

12. What is negative VOT and in what type of plosives is it noticeable?

Negative VOT is when the vocal cords start vibrating before the stop is released. It is noticeable in voiced stops, with a VOT noticeably less than zero.

13. Why is VOT an important feature in experimental phonology?

VOT is an important feature in experimental phonology as it is used in order to analyze the nature of different languages and their stop sounds.

14. How can VOT values provide information regarding the phonemic contrast of appropriate sound production by the learners?

Language specific VOT values can provide information regarding the phonemic contrast of appropriate sound production by the learners.

15. Which language has strongly aspirated stops where the aspiration (and therefore the VOT) lasts twice as long as that of English?

Navajo has strongly aspirated stops where the aspiration (and therefore the VOT) lasts twice as long as that of English.

16. How is the timing of voicing in relation to consonant articulation important in distinguishing plosive sounds?

It is not a simple matter of a plosive being either completely voiced or completely voiceless. The timing of the voicing in relation to the consonant articulation is also very important in distinguishing plosive sounds. This is evident in the delay or lag which has been given its own name, aspiration, and has led to the development of a scientific measure of voice timing called VOT.

CODE: ENG507

OBJECTIVE PART

LESSON 21

1. In phonetics and phonology, speech sounds are defined as what?

- a) sentences
- b) paragraphs
- c) words
- d) gestures

2. What is the purpose of enhancing the ability of experts to describe unfamiliar sounds?

- a) To invent a new language
- b) To generate more speech sounds
- c) To clarify variation between varieties and among languages and language families
- d) To teach a new language

3. What do the traditional terms for places of articulation represent?

- a) Different languages
- b) Sounds found in English
- c) Articulatory targets
- d) Different gestures

4. What is a possible type of articulatory gesture?

- a) Optical gesture
- b) Technologic gesture
- c) Ocular gesture
- d) Bilabial gesture

5. Which of the following is not a feature of the English language?

- a) Dental fricatives [θ, ð]
- b) Labiodental fricatives
- c) Labiodental stops or nasals
- d) Dental stops or nasals

6. What is a common sound in Pakistani languages made by curling the tip of the tongue up and back?

- a) Affricate
- b) Labiodental
- c) Retroflex
- d) Palatal

7. Which of the following sounds are commonly found in Urdu and other Pakistani languages?

- a) [x, ɣ]
- b) [p, b]
- c) [t, d]
- d) [f, v]

8. In which language are voiceless nasals symbolized by adding the voiceless diacritic?

- a) French
- b) English

- c) Burmese
- d) Ukrainian

9. Which two voiceless fricatives have the loudest high pitches?

- a) [f, ʃ]
- b) [s, ʃ]
- c) [θ, s]
- d) [f, θ]

10. Which fricative sounds are considered sibilant sounds?

- a) p, t, k, b
- b) s, z, ʒ, ʃ
- c) f, θ, v, ð

11. In phonetics and phonology, speech sounds are defined as _____.

- A) abstract characterizations of articulatory events
- B) intrinsic time dimensions
- C) gestures
- D) units of contrast

12. The purpose of reviewing speech sounds involving their gestural movements is to _____.

- A) clarify the variation between varieties of a language
- B) describe the phonological structure of specific languages
- C) enhance the ability to describe unfamiliar sounds
- D) account for phonological variation

13. Articulatory targets are names for _____.

- A) specific locations on the roof of the mouth

- B) non-English sounds found in other languages
- C) classes of functionally equivalent movement patterns
- D) particular places of articulation used in languages

14. Which of the following is an example of a bilabial gesture?

- A) [θ]
- B) [ɸ]
- C) [ŋ]
- D) [ʃ]

15. Dental sounds are present in _____.

- A) French, Italian, and other languages
- B) British and American English
- C) Urdu, Pashto, and Sindhi
- D) Arabic and other Semitic languages

16. Retroflex sounds are made by _____.

- A) curling the tip of the tongue up and back
- B) pulling the root of the tongue or the epiglottis back
- C) using the pharynx as a target for articulatory gestures
- D) placing the tongue against the alveolar ridge

17. Nasal release is a characteristic feature of _____.

- A) ejective affricates

- B) prenasalized sounds
- C) voiceless fricatives
- D) lateral release stops

18. Nasals are commonly _____.

- A) voiceless in English and other languages
- B) used in nasal release stops
- C) symbolized by adding a voiceless diacritic
- D) found in languages such as Burmese, Ukrainian, and French

19. Fricatives can be subdivided based on _____.

- A) the manner of articulation
- B) their acoustic energy
- C) their locations of articulation
- D) their voicelessness or voicing

20. Sibilant sounds have _____.

- A) less acoustic energy and a lower pitch
- B) greater loudness and a higher pitch
- C) a narrow channel for the airstream
- D) a wide slit through which the air flows

1. What are gestures in the context of phonetics and phonology?

Answer: Gestures are abstract characterizations of articulatory events with an intrinsic time dimension used to describe speech sounds.

2. How are sounds represented in phonetics and phonology?

Answer: Sounds are represented by classes of functionally equivalent movement patterns or gestures.

3. What is the purpose of reviewing speech sounds involving gestural movements?

Answer: The purpose is to enhance the ability to describe unfamiliar sounds and clarify variations between languages and language families.

4. Which branch of linguistics deals with the place and manner of articulation?

Answer: Phonetics.

5. Which sounds involve bilabial gestures?

Answer: Stops, nasals, and fricatives like /p/, /b/, and /m/.

6. Which language contrasts voiceless bilabial and labiodental fricatives?

Answer: Ewe of West Africa.

7. What are labiodental fricatives?

Answer: Sounds like /f/ and /v/ that are produced with the lower lip touching the upper teeth.

8. Are there labiodental stops or nasals in English?

Answer: No, labiodental stops or nasals are not present in English.

9. Which sounds occur at the alveolar place of articulation?

Answer: Stops, nasals, and fricatives like /t/, /d/, /n/, and /l/.

10. How are retroflex sounds produced?

Answer: By curling the tip of the tongue up and back.

11. What are the articulatory targets for palato-alveolar and palatal sounds?

Answer: The palato-alveolar and palatal regions of the mouth.

12. Which language features velar fricatives?

Answer: Urdu and other Pakistani languages.

13. What types of articulatory gestures are involved in pharyngeal and epiglottal sounds?

Answer: Pulling the root of the tongue or the epiglottis back toward the back wall of the pharynx.

14. What are some of the different types of stops found in various languages?

Answer: Voiced stops, voiceless unaspirated stops, aspirated stops, implosives, and more.

15. How are voiceless nasals represented in phonetic symbols?

Answer: Voiceless nasals are represented by adding the voiceless diacritic [] under the symbol for the voiced sound.

CODE: ENG507

REVIEW EXERCISE

LESSON 19,20,21

CHOOSE THE CORRECT OPTIONS.

1. What are the traditional terms for places of articulation representing?

- a) Different languages
- b) Sounds found in English
- c) Articulatory targets
- d) Different gestures

2. Which language commonly features a sound produced by curling the tip of the tongue up and back?

- a) Affricate
- b) Labiodental
- c) Retroflex
- d) Palatal

3. Voiceless nasals in which language are symbolized by adding the voiceless diacritic?

- a) French
- b) English
- c) Burmese

d) Ukrainian

4. Which two voiceless fricatives have the loudest high pitches?

- a) [f, ʃ]
- b) [s, ʃ]
- c) [θ, s]
- d) [f, θ]

5. Which fricative sounds are considered sibilant sounds?

- a) p, t, k, b
- b) s, z, ʒ, ʃ
- c) f, θ, v, ð

6. In phonetics and phonology, speech sounds are defined as _____.

- a) abstract characterizations of articulatory events
- b) intrinsic time dimensions
- c) gestures
- d) units of contrast

7. What is the purpose of reviewing speech sounds involving their gestural movements?

- a) To clarify the variation between varieties of a language
- b) To describe the phonological structure of specific languages
- c) To enhance the ability to describe unfamiliar sounds

d) To account for phonological variation

8. Articulatory targets are names for _____.

- a) specific locations on the roof of the mouth
- b) non-English sounds found in other languages
- c) classes of functionally equivalent movement patterns
- d) particular places of articulation used in languages

9. Which of the following is an example of a bilabial gesture?

- a) [θ]
- b) [ɸ]
- c) [ŋ]
- d) [ʃ]

10. Dental sounds are present in _____.

- a) French, Italian, and other languages
- b) British and American English
- c) Urdu, Pashto, and Sindhi
- d) Arabic and other Semitic languages

11. Which language commonly uses voiceless fricatives [θ, ð]?

- a) English
- b) French
- c) Urdu

d) German

12. What term is used for sounds made by curling the tongue tip back in Pakistani languages?

- a) Affricate
- b) Retroflex
- c) Palatal
- d) Labiodental

13. Which language uses voiceless nasals and represents them with a diacritic?

- a) French
- b) English
- c) Burmese
- d) Ukrainian

14. Which two voiceless fricatives have the highest pitch?

- a) [f, ʃ]
- b) [s, ʃ]
- c) [θ, s]
- d) [f, θ]

15. Which sounds are considered sibilant fricatives?

- a) [p, t, k, b]
- b) [s, z, ʒ, ʃ]

c) [f, θ, v, ð]

ANSWERS THE FOLLOWING QUESTION

1. What is phonation and how is it related to the glottis?
2. What is phonation?
3. What is phonation and why is it important to study the types of phonation?
4. How does variation in the states of the glottis affect vocal characteristics such as pitch, loudness, and voice quality?
5. What is the meaning of expression in speech sounds?
6. What is a stroke and when is it used in RP?
7. What is the role of the larynx in speech production?
8. What is phonation and how is it related to articulation?
9. What are the different states of the glottis and how do they affect speech sounds?
10. How does speaking contribute to distinguishing sounds in different languages?
11. What is the timing of voicing in relation to consonant articulation and what is aspiration?
12. What is Voice Onset Time (VOT) and how is it measured in relation to the production of explosive sounds?
13. Why is VOT an important feature for experimental phonology?
14. Why are language-specific VOT values important to consider, according to the context provided?
15. What are the three possible types of VOT based on the nature of stop sounds?

1. Which language uses the sound 'ɹ'?

- a) English
- b) Hausa
- c) None of the above
- d) Spanish

2. What is the different articulatory gesture used in the 'r' sound?

- a) Alveolar tap
- b) Alveolar approximant
- c) Alveolar trill
- d) Retroflex flap

3. Which Mughal emperor had a good relationship with the Roman Catholic Church and various religious groups?

- a) Jahangir
- b) Shah Jahan
- c) Akbar
- d) Babur

4. What is the most common form of lateral sound?

- a) Voiced labiodental flap
- b) Lateral approximant
- c) Lateral fricative
- d) Lateral stop

5. What is the name of the sound that flows freely without audible friction in all forms of English?

- a) Voiced velar lateral approximant
- b) Unvoiced alveolar lateral approximant
- c) Voiced dental lateral approximant
- d) Voiced alveolar lateral approximant

6. Which sound may be compared with the [ɹ] sound in 'red'?

- a) Unvoiced alveolar central approximant
- b) Voiced velar central approximant
- c) Voiced alveolar central approximant
- d) Voiced dental central approximant

7. How many types of stop sounds were studied in the sections on various stop sounds in world languages?

- a) 20
- b) 9
- c) 13
- d) 5

8. Which category do trill, tap, and flap sounds fall under?

- a) Vowels
- b) Nasals
- c) Approximants
- d) Fricatives

9. What does an 'oral gesture' specify?

- a) Subglottal characteristics
- b) Supraglottal characteristics
- c) Nasal characteristics
- d) Laryngeal characteristics

10. In which type of phonology are 'categorical', 'articulatory', and 'initiatory' gestures distinguished?

- a) Optimality theory
- b) Generative phonology
- c) Dependency phonology
- d) Natural phonology

11. On what basis are consonant sounds mainly classified?

- a) Their pitch

- b) Characteristics of their primary articulation
- c) Their duration
- d) Characteristics of their secondary articulation

12. Which book provides further readings on consonant articulation?

- a) To Kill a Mockingbird by Harper Lee
- b) A Course in Phonetics by Peter Ladefoged and Keith Johnson
- c) Introduction to Algebra by Michael Artin
- d) The God of Small Things by Arundhati Roy

13. Which language features a voiced alveolar trill?

- A) Spanish
- B) Czech
- C) English
- D) French

14. What is the voiced alveolar flap symbol in Hausa?

- A) R
- B) ɾ
- C) ɹ
- D) r

15. Which approximant sound is found in American English?

- A) R
- B) ɹ
- C) ɻ
- D) ɽ

16. What is the voiced bilabial trill symbol in Kele?

- A) ʙ
- B) ɾ
- C) ʙ
- D) *

17. Which language features a voiced uvular fricative or approximant?

- A) Spanish
- B) French
- C) Czech
- D) English

18. In British English, what is the allophone of the /l/ phoneme in the word "bell"?

- A) [l]
- B) [ɫ]
- C) [R]
- D) [r]

19. Which articulatory gesture is most common in producing lateral sounds?

- A) Stop
- B) Fricative
- C) Approximant

D) Tap

20. In American English, initial [l] has more _____ than in British English.

A) aspiration

B) velarization

C) voicing

D) frication

21. How many types of trill, tap, and flap sounds are studied in the sections on various stop sounds?

A) 9

B) 13

C) 22

D) 26

22. The articulatory gestures for consonants are primarily classified based on the characteristics of their _____.

A) secondary articulation

B) phonation

C) airstream source

D) primary articulation

CODE: ENG507

SUBJECTIVE PART

LESSON 22

Q1: What is the purpose of this section?

A1: The purpose of this section is to explain and distinguish among various types of articulatory gestures used during the production of English consonants.

Q2: What are some examples of approximant sounds found in different languages?

A2: Some examples of approximant sounds found in different languages include the voiced alveolar trill [r] in Spanish, the voiced alveolar tap [ɾ] in Spanish, the voiced retroflex flap [ɽ] in Hausa, the voiced alveolar approximant [ɹ] in English, the voiced alveolar fricative trill [ʀ] in Czech, the voiced uvular trill [ʁ] in French, the voiced uvular fricative or approximant [ʁ] in Parisian French, the voiced bilabial trill [β] in Kele, and the voiced labiodental flap [ɸ] in Margi.

Q3: What is the most common form of lateral sound?

A3: The most common form of lateral sound is the lateral approximant.

Q4: What are the allophones of the English lateral phoneme /l/ in British English?

A4: The allophones of the English lateral phoneme /l/ in British English are [l] as in "led" [lɛd] and [ɫ] as in "bell" [bɛɫ].

Q5: How does the velarization of the initial [l] in American English differ from British English?

A5: In most forms of American English, the initial [l] has more velarization compared to what is typically heard in British English initial [l].

Q6: Are laterals usually presumed to be voiced or voiceless?

A6: Laterals are usually presumed to be voiced approximants unless a specific statement to the contrary is made.

Q7: What is the main idea behind the concept of articulatory gestures?

A7: The main idea behind the concept of articulatory gestures is that a particular gesture gradually increases its influence on the shape of the vocal tract, making many sounds similar in terms of articulatory features.

Q8: How are speech segments modeled in terms of gestures?

A8: Speech segments are modeled as sets of gestures that have their own intrinsic temporal structure, allowing them to overlap.

Q9: How many types of stop sounds were studied in the sections on various stop sounds in world languages?

A9: Thirteen types of stop sounds were studied in the sections on various stop sounds in world languages.

Q10: How many types of trill, tap, and flap sounds (approximants) were studied in the sections on world languages?

A10: Nine types of trill, tap, and flap sounds (approximants) were studied in the sections on world languages.

Q11: What is the basis for classifying similar sounds in the same class of segments?

A11: A matrix of features specifying a particular characteristic of a segment and relating that particular characteristic to other similar sounds forms the basis for classifying similar sounds in the same class of segments.

Q12: What are the three types of gestures distinguished in dependency phonology?

A12: The three types of gestures distinguished in dependency phonology are "categorical," "articulatory," and "initiator" gestures.

Q13: How are gestures further analyzed in dependency phonology?

A13: Gestures are further analyzed into subgestures, such as glottal stricture, airstream direction, and airstream source.

Q14: What is the main basis for classifying consonant sounds?

A14: The main basis for classifying consonant sounds is the characteristics of their primary articulation.

Q15: What additional basis can be used to classify sounds together?

A15: Sounds can also be classified together based on their secondary articulation, such as added lip rounding.

CODE: ENG507

OBJECTIVE PART

LESSON 23

1. Acoustics, as a branch of phonetics, focuses on studying the _____ of speech sound.

- A) articulatory properties
- B) phonetic differences
- C) physical properties
- D) duration or length

2. Acoustic phonetics analyzes the relationship between the speaker's vocal tract and the resulting sounds by involving which fields?

- A) Linguistics and psychology
- B) Physics, computer, and statistics
- C) Phonology and morphology
- D) Anthropology and sociology

3. Acoustic analysis in phonetics provides clear and objective data for the investigation of speech, primarily through _____.

- A) auditory phonetics
- B) articulatory phonetics
- C) mechanical limitations
- D) physical properties

4. Acoustic analysis of vowels often involves measuring the frequencies of _____.

- A) formants
- B) harmonics
- C) overtones
- D) pitch

5. What is the purpose of a spectrogram in acoustic phonetics?

- A) Analyzing vowel formants
- B) Measuring speech duration
- C) Recording speech sounds

D) Analyzing speech vibrations

6. The source-filter theory in acoustic phonetics explains speech production as the interaction between the _____.

- A) vocal tract and the hearer's ear
- B) speaker's mouth and the listener's ear
- C) vocal folds and the lips**
- D) noise source and the cavity

7. What does the source refer to in the source-filter theory?

- A) Vibrating larynx**
- B) Vocal tract
- C) Formants
- D) Harmonics

8. Acoustic analysis describes the durational characteristics, articulatory properties, and phonetic differences through _____.

- A) spectrograms
- B) mathematical techniques
- C) physiological measurements**
- D) computer software

9. The formants of vowels are related to their _____.

- A) pitch
- B) duration**

C) quality

D) loudness

10. Acoustic phonetics relies on instrumental techniques of investigation and is considered more _____ than the traditional auditory method.

A) objective and scientific

B) subjective and intuitive

C) mechanical and reliable

D) comprehensive and precise

11. Which software is commonly used in acoustic phonetics for analyzing speech sounds?

A) Praat

B) Audacity

C) Pro Tools

D) Adobe Audition

12. The acoustic analysis of speech focuses on studying the physics of the speech signal as it travels through the air in a _____.

A) wave form

B) particle form

C) linear form

D) digital form

13. The combination of the larynx as the source and the vocal tract as the filter is known as the _____ model of speech production.

- A) articulatory
- B) auditory
- C) source-filter
- D) phonological

14. Acoustic analysis provides information about the _____ of a speech sound.

- A) loudness
- B) quality
- C) pitch
- D) all of the above

15. What kind of measurements are typically taken in acoustic analysis?

- A) Phonemic categories
- B) Articulatory gestures
- C) Physical properties
- D) Psychological states

16. The frequency structure of vowel sounds is represented by the measurement of _____.

- A) formants
- B) harmonics
- C) phonemes

D) syllables

17. Acoustic phonetics utilizes advanced speech software to analyze sound differences in terms of _____.

A) syntax and morphology

B) prosody and intonation

C) pitch, loudness, and quality

D) articulation and phonology

18. What distinguishes one vowel from another in terms of acoustic analysis?

A) Duration

B) Formants

C) Harmonics

D) Intensity

19. Which branch of science does acoustic phonetics heavily rely on for its analysis?

A) Biology

B) Physics

C) Chemistry

D) Geology

20. The expertise available in acoustic phonetics is claimed to be more objective and scientific compared to the traditional auditory method, which mainly depends on the reliability of _____.

- A) computer software
- B) spectrograms
- C) the trained human ear
- D) mathematical techniques

CODE: ENG507

SUBJECTIVE PART

LESSON 23

1.What is acoustic phonetics?

Acoustic phonetics is the branch of phonetics that studies the physical properties of speech sounds as they travel through the air in wave form, analyzing vibrations and using mathematical techniques to produce spectrograms of speech. It involves the relationship between vocal tract activity and resulting sounds, using physics, computer science, statistics, and laboratory experiments to provide objective and scientific analysis of speech.

2.Define source/filter theory in acoustic phonetics.

The source/filter theory is a model of speech production that explains how speech sounds are produced. According to this theory, the source refers to the waveform of the vibrating larynx, while the vocal tract acts as a filter, modifying the laryngeal source by reinforcing certain harmonics relative to others. This combination of the source (larynx) and filter (vocal tract) is known as the source-filter model of speech production.

3.What is the purpose of acoustic analysis in phonetics?

Acoustic analysis provides objective data for the investigation of speech sounds. It involves the measurement and analysis of the physical properties of speech, such

as duration, articulatory properties, and phonetic differences, through physiological measurement. Acoustic analysis helps describe the characteristics of speech sounds and supports analyses made in articulatory or auditory phonetics.

4.How are vowels analyzed acoustically?

Vowels can be analyzed acoustically by measuring the actual frequencies of their formants. Formants represent the resonance frequencies of the vocal tract during the production of a vowel sound. By analyzing the formant structure of vowels and plotting them on a chart, phoneticians can describe and compare different vowel sounds.

5.What are the main components of the source-filter model of speech production?

The main components of the source-filter model of speech production are the source (the waveform of the vibrating larynx) and the filter (the vocal tract). The laryngeal source produces a spectrum rich in harmonics, while the movements of the vocal tract, particularly the tongue and lips, act as a filter that modifies the spectrum by reinforcing certain harmonics relative to others.

6.How does acoustic analysis contribute to understanding speech sound quality?

Acoustic analysis helps understand speech sound quality by examining the overtone structure of sounds. It reveals that a sound, such as a vowel, contains different pitches simultaneously. The pitch at which it is spoken and the various overtone pitches contribute to its distinctive quality. Acoustic analysis allows the identification and differentiation of vowels based on the differences in their formants.

7.What is the role of the vocal tract in the source-filter model?

In the source-filter model, the vocal tract serves as a frequency filter. It interacts with the sound waves produced by the vibrating vocal folds, reflecting some of the sound energy back into the vocal tract while radiating the rest from the lips for a listener to hear. This interaction between the source (vocal folds) and the cavity (vocal tract) alters the timbre or quality of the vocal fold sound.

8.How does acoustic analysis contribute to the study of speech sounds?

Acoustic analysis provides objective data for investigating speech sounds, offering insights into their physical properties, duration, articulatory properties, and phonetic differences. It helps researchers analyze and understand the acoustic characteristics of speech sounds and supports the study of phonetics by providing quantitative measurements and visual representations of the speech signal.

9.What is the significance of acoustic phonetics compared to traditional auditory methods?

Acoustic phonetics is considered more objective and scientific compared to traditional auditory methods, which rely on the reliability of the trained human ear. Acoustic phonetics utilizes advanced speech analysis software, mathematical techniques, and laboratory experiments to provide a more systematic and quantitative approach to the study of speech sounds, enhancing the objectivity and precision of phonetic analysis.

10.What software is commonly used in acoustic phonetics?

Praat is a commonly used software in acoustic phonetics. It is a computer program that allows for the analysis, manipulation, and visualization of speech sounds. Praat provides tools for spectrographic analysis, pitch analysis, formant analysis, and other measurements, facilitating the study of acoustic properties of speech.

1.Which model of vocal tract helps in understanding the concept of vowels and their formants?

- A) Source-filter model
- B) Tube model
- C) Perturbation theory
- D) Acoustic analysis model

What causes the air in the vocal tract to vibrate at resonant frequencies?

- A) Vibration of vocal folds
- B) Opening and closing of lips
- C) Activation of vocal tract muscles
- D) Resonance of nasal passages

3.How many formants are typically produced in most voiced sounds during the vibration of vocal folds?

- A) One
- B) Two
- C) Three
- D) Four

4.What aspect of the vocal tract's shape influences the resonant frequencies and formants of different vowels?

- A) Length of the vocal tract

- B) Width of the vocal folds
- C) Shape of the filter (tract)
- D) Thickness of the vocal cords

5. According to the tube model, what is the relationship between resonance in the vocal tract and the rate of vibration of the vocal folds?

- A) Resonance is directly proportional to the rate of vibration.
- B) Resonance is inversely proportional to the rate of vibration.
- C) Resonance is independent of the rate of vibration.
- D) Resonance is influenced by the loudness of vibration.

6. The tube model allows us to understand the relationship between which two aspects?

- A) Vowel quality and formant structure
- B) Articulatory configurations and vocal fold vibrations
- C) Pitch variations and overtone frequencies
- D) Vocal tract shape and resonant frequencies

7. What can be analyzed through spectrograms in acoustic analysis of vowels?

- A) Intensity of vowel sounds
- B) Duration of vowel sounds
- C) Formant frequencies of vowels
- D) Lip rounding of vowels

8. Which formant is inversely related to the height of a vowel sound?

A) F1

B) F2

C) F3

D) F4

9.What can be concluded about the acoustic features of consonants compared to vowels?

A) Consonants have simpler acoustic features than vowels.

B) Consonants have similar acoustic features to vowels.

C) Consonants have more complex acoustic features than vowels.

D) Consonants have no acoustic features.

10.Which consonantal sounds have a structure similar to vowels and share some acoustic features with them?

A) Stops

B) Nasal consonants

C) Voiceless fricatives

D) Glides

11.How can neighboring vowels help in distinguishing consonantal sounds?

A) They have similar acoustic features.

B) They provide additional context.

C) They have similar formant frequencies.

D) They exhibit similar lip rounding.

12. According to perturbation theory, what happens to the resonance frequency of a particular resonance mode when a constriction is located at an anti-node of that mode?

- A) It decreases.
- B) It increases.
- C) It remains the same.
- D) It becomes unpredictable.

13. What can be predicted using perturbation theory for the acoustic analysis of vowels?

- A) Formant frequency differences between rounded and unrounded vowels
- B) Spectrogram characteristics of nasal consonants
- C) Source-filter characteristics of fricative sounds
- D) Pitch variations in approximant consonants

14. How are the acoustic properties of voiced stops different from voiceless stops?

- A) They have different formant frequencies.
- B) They produce silence during closure.
- C) They exhibit distinct spectrogram patterns.
- D) They rely on adjacent vowels for quality.

15. What can be observed in spectrograms to distinguish stops from other consonants?

- A) Dark bands for energy concentrations

- B) Rapid changes in formant frequencies
- C) Presence of anti-nodes in the vocal tract
- D) Thin lines indicating complete closure

16.What is the purpose of the acoustic analysis of consonants?

- A) To identify neighboring vowels
- B) To determine articulatory configurations
- C) To predict formant frequencies
- D) To analyze spectrogram features

17.Which theory explains the resonance frequencies in a uniform tube with localized modifications?

- A) Source-filter theory
- B) Tube model theory
- C) Perturbation theory
- D) Acoustic analysis theory

18.What is the relationship between the position of a constriction and the resonance frequency in perturbation theory?

- A) Constriction at an anti-node increases the resonance frequency.
- B) Constriction at a node increases the resonance frequency.
- C) Constriction at an anti-node decreases the resonance frequency.
- D) Constriction at a node decreases the resonance frequency.

19. Which aspect of consonantal sounds gives an opportunity to distinguish them from vowels?

- A) Presence of formants
- B) Changes in lip rounding
- C) Complexity of acoustic features
- D) Visible closures on the spectrogram

20. What can be used as a guide to analyze the acoustic features of consonants?

- A) Chapter 8 of the textbook
- B) Source-filter characteristics
- C) Online spectrogram tools
- D) Phonetics course instructions

21. What does the vertical scale represent in spectrograms?

- A) Time
- B) Intensity
- C) Frequency
- D) Articulatory position

22. What information does the degree of darkness in spectrograms represent?

- A) Vowel height
- B) Lip rounding
- C) Formant frequencies
- D) Glottal opening

23. How are vowel sounds distinguished from consonant sounds during closures?

- A) By the presence of voiceless stops
- B) By the changes in lip configuration
- C) By the articulatory configuration of vowels
- D) By the effect on the adjacent vowel sounds

24. What is the relationship between vowel quality and formant structure?

- A) Vowel quality depends on formant frequencies.
- B) Vowel quality is independent of formant frequencies.
- C) Vowel quality is determined by lip rounding.
- D) Vowel quality is influenced by glottal opening.

25. What are the primary acoustic features used to plot vowels on a chart?

- A) Intensity and duration
- B) F1 and F2 formant frequencies
- C) Rate of vocal fold vibration
- D) Constriction locations in the vocal tract

CODE: ENG507

SUBJECTIVE PART

LESSON 24

Q1: What is the tube model of the vocal tract?

A: The tube model of the vocal tract explains how the different shapes of the vocal tract result in formants, which characterize different vowels.

Q2: What causes the air in the vocal tract to vibrate?

A: The air in the vocal tract is set in vibration by the action of the vocal folds in the larynx.

Q3: How many formants are typically produced in most voiced sounds?

A: In most voiced sounds, three formants are produced every time the vocal folds vibrate.

Q4: Is the resonance in the vocal tract dependent on the rate of vocal fold vibration?

A: No, the resonance in the vocal tract (filter) is independent of the rate of vocal fold vibration (source).

Q5: How do the formants change when the vocal tract is modified?

A: The resonance frequencies (formants) change as per the position and modification in the size and nature of the vocal tract (tube).

Q6: What is perturbation theory?

A: Perturbation theory explains how resonance frequencies change when there is a small modification in the diameter of a local region of the vocal tract.

Q7: How does perturbation theory predict formant frequency differences between rounded and unrounded vowels?

A: Perturbation theory predicts that constriction at the lips, which reduces the diameter of the vocal tract, will cause formant frequency differences between rounded and unrounded vowels.

Q8: How can vowel sounds be analyzed using computer programs?

A: Vowel sounds can be analyzed using computer programs that display their components through a spectrogram, showing concentrations of energy at particular frequencies.

Q9: What do the first two formant frequencies represent in vowel sounds?

A: The first formant (F1) is inversely related to the height of a vowel, while the second formant (F2) is related to the frontness of a vowel sound.

Q10: Are consonantal sounds generally more complicated in terms of their acoustic properties compared to vowels?

A: Yes, consonantal sounds are usually more complicated in terms of their acoustic properties compared to vowels.

Q11: What distinguishes consonantal sounds from vowels during their production?

A: The distinguishing features of consonantal sounds are not prominently visible during their production, unlike vowels.

Q12: How are consonant sounds distinguished from vowels on spectrograms?

A: Consonant sounds often show complete closures, which appear as simple thin lines on spectrograms, while vowels show formants.

Q13: Are the changes in the vocal tract distinguishable in the acoustic analysis of consonants?

A: The changes in the vocal tract during the production of consonants, especially obstruents, are not easily distinguishable in acoustic analysis.

Q14: What types of consonants have acoustic features similar to vowels?

A: Nasal consonants, approximants, and glides have acoustic features that are somewhat similar to vowels.

Q15: How can neighboring vowels help in guessing the exact consonant sounds?

A: Neighboring vowels provide contextual information that aids in predicting the exact consonant sounds.

Q16: What is the recommended source for further readings on acoustic analysis of consonants?

A: Chapter 8 of the textbook "A Course in Phonetics" by Peter Ladefoged and Keith Johnson is a recommended source for further readings.

Q17: What do spectrograms display in terms of speech characteristics?

A: Spectrograms display dark bands for concentrations of energy at particular frequencies, showing the source and filter characteristics of speech.

Q18: How does the size and shape of the vocal tract affect the resonance frequencies?

A: Changes in the size and shape of the vocal tract cause the resonance frequencies (formants) to change.

Q19: How does the tube model of the vocal tract contribute to understanding resonance and acoustic consequences?

A: The tube model allows for an understanding of resonance, resonant frequencies (formants), the source-filter model, and the relationship between articulatory configurations and their acoustic consequences.

Q20: Where can one find online sources for further information on tube models and acoustic analysis?

A: Online sources for further information include <http://www.splab.net/APD/G400/index-e.html> and http://www.phon.ox.ac.uk/jcoleman/tubes_practical.html.

CODE: ENG507

OBJECTIVE PART

LESSON 25

1.What are spectrograms mainly used for in the context of phonetics and phonology?

- a) Analyzing individual differences in speech
- b) Identifying consonant sounds in connected speech
- c) Understanding the behavior of vowels in isolation
- d) Studying the complex nature of speech structure

2.What is the general characteristic of a "voiced" consonant in a spectrogram?

- a) Random noise pattern in higher frequency regions
- b) Gap in pattern with a burst for voiceless stops
- c) Vertical striations corresponding to vocal fold vibrations
- d) Low locus of both second and third formants

3.What is the characteristic behavior of a "bilabial" consonant in a spectrogram?

- a) Locus of second formant about 1700–1800 Hz
- b) Random noise pattern in higher frequency regions
- c) Vertical striations corresponding to vocal fold vibrations
- d) High locus of the second formant

4. Which formants are typically analyzed with more attention when interpreting spectrograms of vowels?

- a) Second and third formants
- b) First and second formants
- c) First and fourth formants
- d) Third and fourth formants

5. What does a "stop" sound look like in a spectrogram?

- a) Vertical striations corresponding to vocal fold vibrations
- b) Gap in pattern with a burst for voiceless stops
- c) Random noise pattern in higher frequency regions
- d) Low locus of both second and third formants

6. What can be observed from a spectrogram to determine whether a stop has weakened to a fricative?

- a) A burst and aspiration
- b) Random noise pattern in higher frequency regions
- c) General lowering of the third and fourth formants
- d) Gap in pattern with a burst for voiceless stops

7.Which of the following characteristics indicates a "nasal" consonant in a spectrogram?

- a) Random noise pattern in higher frequency regions
- b) Low locus of both second and third formants
- c) Vertical striations corresponding to vocal fold vibrations
- d) Formant structure similar to that of vowels

8.What is the importance of learning spectrogram techniques in the context of speech recognition?

- a) Improving intonation and rhythm in speech
- b) Identifying the complexity of speech-synthesis systems
- c) Exploring the individual segmental influences on speech
- d) Recognizing the nature and physical properties of sounds

9.How can formant plots of different speakers be compared to identify individual variations in speech?

- a) By analyzing the behavior of adjacent vowels
- b) By studying the relative quality of spectrograms
- c) By comparing the burst and aspiration in stop sounds
- d) By observing the overall structure and frequency scale

10.What information can be obtained from the spectrogram about the manner of articulation of various sounds?

- a) The presence of retroflex sounds
- b) The occurrence of voiced and voiceless sounds
- c) The possibility of stop weakening to a fricative or approximant

d) The differences between bilabial and velar sounds

11. How can experts in forensic investigations use spectrograms for identification purposes?

- a) By analyzing the formant structure of consonants
- b) By comparing spectrograms of different speakers' sets of vowels
- c) By studying the behavior of adjacent vowels in connected speech
- d) By analyzing the formant frequencies in relation to head size

12. What aspect of speech recognition do phoneticians and computer speech technology experts aim to improve?

- a) Intonation and rhythm in speech synthesis systems
- b) Accuracy in identifying individual speakers through voiceprints
- c) Complexity of speech-synthesis systems and intonation patterns
- d) Acoustic data comparison and the recognition of speech complexity

13. Which fields, apart from computer engineers, can play an important role in speech recognition research?

- a) Phonetics, speech therapy, and hearing sciences
- b) Linguistics, syntax, and pragmatics
- c) Forensic investigations and legal expertise
- d) Applied phonetics and computer speech technology

14. What potential does the use of spectrograms hold for future research studies?

- a) Advancing techniques for forensic investigations
- b) Developing machine translation algorithms
- c) Exploring intonation and rhythm in speech
- d) Expanding applications in speech recognition

15. Which chapter of the textbook "A Course in Phonetics" covers the topics discussed in these paragraphs?

- a) Chapter 5
- b) Chapter 6
- c) Chapter 7
- d) Chapter 8

16. Why is it important for phonetics and phonology students to learn how to interpret spectrograms?

- a) To understand the behavior of vowels in isolation
- b) To analyze individual differences in speech
- c) To identify the nature and physical properties of sounds
- d) To practice and improve their understanding of speech sounds

17. What can spectrograms help researchers determine about a sound?

- a) Whether it is a phoneme or allophone
- b) Its behavior in different forms of speech
- c) The characteristics of speech sounds
- d) Its frequency and amplitude variations

18.What role do spectrograms play in the field of machine translation?

- a) They are used to analyze connected speech
- b) They assist in speech recognition techniques**
- c) They help identify individual differences in speech
- d) They aid in the synthesis of speech sounds

19.Which technique is recommended when analyzing sounds in connected speech using spectrograms?

- a) Analyzing sounds individually based on their class**
- b) Focusing on the overall structure and frequency scale
- c) Examining the burst and aspiration in stop sounds
- d) Comparing formant plots of average speakers

20.What information can be obtained by analyzing the adjacent vowels when interpreting consonants in spectrograms?

- a) The locus of the second formant for velar consonants
- b) The frequency and amplitude variations of the second formant
- c) The behavior of the second and third formants for alveolar consonants
- d) The manner of articulation and potential weakening of stops to fricatives**

21.What relationship exists between the first formant and the height of a vowel in a spectrogram?

- a) Inversely proportional**
- b) Directly proportional
- c) No correlation
- d) Random

22.What can be observed in a spectrogram to distinguish trills from taps and flaps?

- a) Burst and aspiration in stop sounds
- b) General lowering of the third and fourth formants
- c) Random noise pattern in higher frequency regions
- d) Differences in duration and formant structure

23.What role do spectrograms play in forensic investigations?

- a) Identifying individual speakers through voiceprints
- b) Analyzing formant plots of different speakers
- c) Comparing relative quality of spectrograms
- d) Assessing the complexity of speech-synthesis systems

24.What formant frequency is considered an indicator of individual head size?

- a) First formant (F1)
- b) Second formant (F2)
- c) Third formant (F3)
- d) Fourth formant (F4)

25.In comparing the formant frequencies of different speakers, what information is important to consider?

- a) The relative positions on a formant chart
- b) The presence of retroflex sounds
- c) The burst and aspiration in stop sounds

d) The behavior of the adjacent vowels

1.What are the hints and ideas for interpreting spectrograms of consonants?

Answer: The hints and ideas for interpreting spectrograms of consonants include vertical striations for voiced sounds, low locus of both second and third formants for bilabial sounds, a second formant locus around 1700-1800 Hz for alveolar sounds, a high locus of the second formant for velar sounds, a general lowering of the third and fourth formants for retroflex sounds, a gap in pattern with burst for voiceless stops and a sharp formant beginning for voiced stops, random noise pattern in higher frequency regions for fricatives, and a formant structure similar to vowels for nasal, lateral, and approximant sounds.

2.What is the importance of learning spectrograms for students of phonetics and phonology?

Answer: Learning spectrograms is important for students of phonetics and phonology because it helps in understanding the nature and behavior of speech sounds in different forms, provides practice to learn about the characteristics of speech sounds, and is essential for experts working on phonetic aspects of speech and signal processing.

3.What are some applications of spectrograms in speech recognition?

Answer: Spectrograms are used as part of techniques in speech recognition and machine translation, enabling the exploration of the complex nature of speech structure and aiding experts in understanding the characteristics of spoken language.

4.What are some useful techniques for interpreting spectrograms in connected speech?

Answer: Some useful techniques for interpreting spectrograms in connected speech include analyzing sounds one by one based on their individual characteristics, paying attention to the overall structure and frequency scale, analyzing the behavior of adjacent vowels when interpreting consonants, focusing on the first two formants for vowels, observing bursts and aspiration in stop sounds, and deriving information about the manner of articulation and differentiation between voiced and voiceless sounds from spectrograms.

5.How can individual differences in speech be studied using spectrograms?

Answer: Individual differences in speech can be studied using spectrograms by comparing relative qualities, formant plots, and formant frequencies of different speakers, considering absolute values of vowels, and examining the relationship between F4 and the first three formants for evaluating individual variation.

6.What is the alternate method for analyzing individual differences in speech?

Answer: An alternate method for analyzing individual differences in speech is to consider a speaker's complete range of vowel qualities representative of their personal features and compare it with the formant frequency of each vowel in that speaker's voice.

7.What are the areas being explored for improving speech synthesis systems?

Answer: Areas such as intonation, rhythm, syntax, pragmatics, and individual segmental influences are being explored for improving speech synthesis systems and developing computer programs for speech recognition.

8.How can phoneticians contribute to speech recognition and speech identification?

Answer: Phoneticians can contribute to speech recognition and speech identification by working with computer engineers and experts in speech therapy and hearing sciences, collaborating to improve the understanding of speech complexity and developing techniques for accurate speech recognition and voice identification.

9.What textbook chapter can provide further readings on this topic?

Answer: Chapter 8 of the textbook "A Course in Phonetics" by Peter Ladefoged and Keith Johnson can provide further readings on this topic.

10.What are the characteristics of voiced consonant sounds in spectrograms?

Answer: Voiced consonant sounds in spectrograms exhibit vertical striations corresponding to the vibrations of the vocal folds.

11.What is the formant structure of nasal consonant sounds in spectrograms?

Answer: Nasal consonant sounds in spectrograms have a formant structure similar to that of vowels, with formants typically found at 250, 2500, and 3250 Hz.

12.How can spectrograms be helpful for researchers working on the nature of a sound?

Answer: Spectrograms, when used with software like Praat, are useful for researchers studying the physical properties of a sound and determining whether it is a phoneme or allophone.

13.What is the importance of studying spectrograms for understanding speech sounds?

Answer: Studying spectrograms enhances our understanding of speech sounds and their behavior in different contexts, such as isolated words or connected speech.

14.What pattern is observed in spectrograms for fricative consonant sounds?

Answer: Fricative consonant sounds exhibit a random noise pattern in higher frequency regions in spectrograms.

15.How can burst and aspiration be observed in spectrograms of stop sounds?

Answer: Spectrograms of stop sounds show a gap in the pattern, and voiceless stops have a burst while voiced stops have a sharp formant beginning.

16.What can be inferred from the formant structure of lateral consonant sounds in spectrograms?

Answer: The formant structure of lateral consonant sounds in spectrograms is similar to that of vowels, with formants typically present at 250, 1200, and 2400 Hz.

17.How can the behavior of adjacent vowels help in interpreting consonants in spectrograms?

Answer: Analyzing the behavior of adjacent vowels in spectrograms can provide insights into the interpretation of consonant sounds.

18.What information can be derived from the first two formants in spectrograms of vowels?

Answer: The first two formants in spectrograms of vowels provide information about the height and backness of the vowel sounds.

19. How can individual variation in speech be studied using spectrograms?

Answer: Spectrograms can be used to study individual variation in speech by comparing formant plots, formant frequencies, and relative qualities of different speakers.

20. What are some potential future research areas related to spectrograms?

Answer: Spectrograms have potential for future research studies, especially in areas like speech recognition, speech synthesis systems, intonation, rhythm, and forensic investigations.

CODE: ENG507

OBJECTIVE PART

LESSON 26

1. What is the fundamental distinction between consonant and vowel sounds?

- a) Vowels obstruct the flow of air more than consonants.
- b) Vowels make the least obstruction to the flow of air.
- c) Vowels and consonants have the same level of obstruction to the flow of air.
- d) Vowels and consonants do not affect the flow of air.

2. Where are vowels typically found in a syllable?

- a) At the beginning
- b) At the end
- c) At the center
- d) Vowels can be found anywhere in a syllable.

3.Which of the following is a property that distinguishes vowels from each other?

- a) Lip-rounding
- b) Nasality
- c) Tongue position
- d) All of the above

4.In British phonetics, what terms are used to describe the height of vowels?

- a) Close and open
- b) High and low
- c) Rounded and unrounded
- d) Front and back

5.Who introduced the concept of "cardinal vowels"?

- a) Paul Passy
- b) Daniel Jones
- c) Peter Ladefoged
- d) Keith Johnson

6.How many primary cardinal vowels are there?

- a) Four
- b) Six
- c) Eight
- d) Ten

7. Which of the following is NOT a primary cardinal vowel?

- a) [i]
- b) [ɑ]
- c) [ʏ]
- d) [ʌ]

8. What is the main difference between primary and secondary cardinal vowels?

- a) Lip-rounding
- b) Tongue position
- c) Nasality
- d) Backness

9. Which numerical code represents the close (high) front rounded vowel in the secondary cardinal vowel system?

- a) 10
- b) 11
- c) 12
- d) 9

10. Which secondary cardinal vowel represents the highest possible position at the center of the tongue?

- a) [ɨ]
- b) [ʌ]
- c) [ʊ]

d) [ɒ]

11. Which vowels are the rounded counterparts of the primary cardinal vowels [i, e, ε, a, ʌ]?

a) [ʌ, ʏ, ɯ]

b) [y, ø, œ, œ, ɔ]

c) [ɔ, o, u]

d) [i, ʊ]

12. What do the cardinal vowel diagrams aim to represent?

a) The exact shape of the tongue during vowel production

b) The degree and direction of tongue movement involved in vowel production

c) The number of vowels in a language

d) The difference between consonants and vowels

13. Which book is recommended for further readings on this topic?

a) A Course in Phonetics by Peter Ladefoged and Keith Johnson

b) The Complete Guide to Vowels and Consonants

c) Phonetics 101: Mastering Vowel Sounds

d) The Art of Vowel Pronunciation

14. What is the purpose of the cardinal vowel quadrilateral?

a) To show the configuration of the human tongue during vowel production

b) To illustrate the difference between primary and secondary cardinal vowels

c) To provide a reference for vowel descriptions in different languages

d) To demonstrate the interaction between vowels and consonants

15. How many secondary cardinal vowels are there?

a) 4

b) 6

c) 8

d) 10

16. Which of the following is NOT a secondary cardinal vowel?

a) [æ]

b) [ʊ]

c) [œ]

d) [ɛ]

17. Which phonetician was strongly influenced by Paul Passy in developing the concept of cardinal vowels?

a) Daniel Jones

b) Peter Ladefoged

c) Keith Johnson

d) Paul Cardinal

18. What is the shape of the cardinal vowel system chart?

a) Square

- b) Triangle
- c) Circle
- d) Four-sided figure

19.What do primary and secondary cardinal vowels represent in the vowel system?

- a) The highest and lowest points of tongue movement
- b) The rounded and unrounded vowels
- c) The front and back vowels
- d) The corners and sides of a map

20.Which of the following is NOT a feature used to describe vowels?

- a) Lip-rounding
- b) Tongue height
- c) Nasality
- d) Jaw movement

21.Which website is recommended for online sources on phonetics?

- a) www.internationalphoneticassociation.org
- b) www.phoneticsresources.com
- c) www.expertphonetics.com
- d) www.soundsandsymbols.org

22. How many features (properties) are used to distinguish vowels from each other?

- a) 1
- b) 2
- c) 3
- d) 4

23. Which of the following vowels is a back unrounded vowel?

- a) [i]
- b) [ɑ]
- c) [ʌ]
- d) [ɛ]

24. Which of the following is NOT a characteristic used in various languages to describe vowels?

- a) Nasality
- b) Lip-rounding
- c) Tongue position
- d) Syllable structure

25. Which vowel is represented by the numerical code 16 in the secondary cardinal vowel system?

- a) Close (high) back unrounded vowel
- b) Open-mid back unrounded vowel
- c) Close-mid back unrounded vowel
- d) Close (high) front rounded vowel

Q1: What is the fundamental distinction between consonant and vowel sounds?

A1: Vowels make the least obstruction to the flow of air.

Q2: Where are vowels typically found in a syllable?

A2: Vowels are almost always found at the center of a syllable.

Q3: Can sounds other than vowels stand alone as a whole syllable?

A3: It is very rare to find any sound, other than a vowel, that can stand alone as a whole syllable.

Q4: What are some features that distinguish vowels from each other phonetically?

A4: The shape of the lips (lip-rounding), part of the tongue (front, middle, or back), and the height of the tongue.

Q5: What terms are used in British phonetics to describe vowel height?

A5: In British phonetics, terms such as "close" and "open" are used for vowel description.

Q6: What terms are used in American phonetics to describe vowel height?

A6: In American phonetics, the terms "high" and "low" are used for vowel description.

Q7: Who introduced the concept of cardinal vowels?

A7: The English phonetician Daniel Jones introduced the concept of cardinal vowels.

Q8: How many cardinal vowels are there in total?

A8: There are eight cardinal vowels in total.

Q9: How did Daniel Jones develop the cardinal vowel system?

A9: He worked out a set of eight vowels called the "cardinal vowels" to be used as reference points.

Q10: What is the main difference between primary and secondary cardinal vowels?

A10: The main difference is related to lip-rounding, as some languages allow lip-rounding for front vowels in the secondary series.

Q11: Can you provide examples of secondary cardinal vowels?

A11: Examples of secondary cardinal vowels include [y], [ø], [œ], [ɛ], [ɔ], [ʌ], [ɜ], [ɯ], [ɨ], and [ɘ].

Q12: How are secondary cardinal vowels related to primary cardinal vowels?

A12: Secondary cardinal vowels are the rounded counterparts or unrounded equivalents of primary cardinal vowels.

Q13: What do the numerical codes 17 and 18 represent in the secondary cardinal vowels?

A13: The numerical codes 17 and 18 represent the highest possible position at the center of the tongue.

Q14: What is the purpose of the cardinal vowel diagram?

A14: The cardinal vowel diagram provides an approximate configuration of tongue movement involved in vowel production.

Q15: Where can one find a description of vowel systems in different dialects and languages?

A15: The cardinal vowel diagrams have been used for the description of vowel systems in the dialects and languages of the world.

Q16: What is the recommended textbook for further readings on this topic?

A16: The textbook "A Course in Phonetics" by Peter Ladefoged and Keith Johnson, specifically Chapter 9, provides further information.

Q17: Can you provide an online source for additional information on this topic?

A17: The International Phonetic Association's website (<https://www.internationalphoneticassociation.org/>) is a recommended online source for further information.

Q18: What is one characteristic used to describe vowels in addition to lip-rounding, tongue position, and height?

A18: One additional characteristic used to describe vowels in various languages is nasality.

Q19: How are the primary cardinal vowels represented in the IPA chart?

A19: The primary cardinal vowels are represented by the symbols [i, e, ε, a, α, ɔ, o, u].

Q20: What is the shape of the cardinal vowel system?

A20: The cardinal vowel system is represented by a chart or four-sided figure, resembling the IPA chart, with eight corners.

CODE: ENG507

OBJECTIVE PART

LESSON 27

1.Which aspect of vowel sounds in various accents of English has been explored by researchers?

- a) Auditory quality
- b) Spectral structure
- c) Comparisons and contrasts
- d) All of the above

2.Which accent of American English represents a conservative difference with Californian English?

- a) Newscasters' English
- b) Pittsburgh English
- c) Detroit English
- d) Californian English

3. In Californian English, how are the vowels in "cot" and "caught" pronounced?

- a) They are both spoken as [ɑ]
- b) They are pronounced differently
- c) They are both spoken as [eɪ]
- d) They are both spoken as [ɪ]

4. Which variety of English pronounces [æ] very close to [ɛ] in some northern cities of the United States?

- a) Californian English
- b) Pittsburgh English
- c) Detroit English
- d) Newscasters' English

5. How many pure vowels and diphthongs are there in the BBC accent of English?

- a) 15
- b) 20
- c) 25
- d) 30

6. What distinguishes the vowel [ʌ] in the BBC accent from the vowel [ɜ]?

- a) Rhotacization
- b) Frequency of the first formant
- c) Lip rounding
- d) Backness of the tongue

7. Which feature makes BBC English a standard variety of English?

- a) Its vowel quality
- b) Its rhotacization
- c) Its lip rounding
- d) Its backness of the tongue

8. How many vowel sounds does Spanish contrast?

- a) 3
- b) 5
- c) 7
- d) 9

9. Which language has contrasting nasal vowels?

- a) Spanish
- b) Danish
- c) Urdu
- d) Japanese

10. What does ATR stand for in the context of vowel sounds?

- a) Advanced Tongue Rounding
- b) Advanced Tongue Root
- c) Articulation of Tongue Roots
- d) Articulatory Tension Ratio

11. In which language is ATR used as a factor in contrast of vowel harmony?

- a) Spanish
- b) Danish
- c) Urdu
- d) Akan

12. What is the opposite direction of advanced tongue root movement called?

- a) Radix movement
- b) Retracted tongue root
- c) Pharyngeal articulation
- d) Larynx lowering

13. What is rhotacization in English phonology?

- a) Pronunciation of /r/ following a vowel
- b) Pronunciation of /r/ before a vowel
- c) Pronunciation of /r/ after a consonant
- d) Pronunciation of /r/ in all positions

14. Which varieties of English are non-rhotic?

- a) American English
- b) BBC English
- c) Received Pronunciation
- d) Californian English

15. Which varieties of English are rhotic?

- a) American English
- b) BBC English
- c) Received Pronunciation
- d) Californian English

16. Which area in the United States is known for its non-rhotic accent?

- a) Boston
- b) Pittsburgh
- c) Detroit
- d) California

17. Which book includes Chapter 9 discussing the topic of vowel quality?

- a) A Course in Phonetics by Peter Ladefoged and Keith Johnson
- b) English Phonetics and Phonology - A Practical Course by Peter Roach
- c) Introduction to Linguistics by George Yule
- d) The Study of Language by George Yule

18. Which feature of vowel quality is not covered by the description of height of tongue and lip rounding?

- a) Backness of the tongue
- b) Advanced tongue root
- c) Larynx lowering

d) Rhotacization

19. Which language contrasts between +ATR and -ATR vowels?

- a) Spanish
- b) Danish
- c) Urdu
- d) Akan

20. In which type of English is the vowel [a] used in words like "father" and "cart"?

- a) Californian English
- b) BBC English
- c) Received Pronunciation
- d) Newscasters' English

21. Which language has three front rounded vowels?

- a) Spanish
- b) Danish
- c) Urdu
- d) Akan

22. What is the term used for vowels occurring after retroflex consonants?

- a) Advanced tongue root
- b) Pharyngeal cavity
- c) Rhotacization

d) Rhotacized vowels

23. Which region of England is known for its rhotic accent?

a) South and west

b) East and north

c) Central

d) Midlands

24. Which region of the United States has a non-rhotic accent?

a) South

b) Midwest

c) West Coast

d) Boston area

25. Which language is spoken in Ghana and utilizes advanced tongue root for vowel contrast?

a) Spanish

b) Danish

c) Urdu

d) Akan

CODE: ENG507

SUBJECTIVE PART

LESSON 27

1. What role do vowel sounds play in various accents of English?

Answer: Vowel sounds provide a basis for comparisons and contrasts among different accents of English.

2.What aspects of vowel quality have researchers explored in different Englishes?

Answer: Researchers have explored the auditory quality and spectral structure of vowels in various accents of English.

3.How does the accent of American English differ from Californian English in terms of vowel pronunciation?

Answer: The accent of American English maintains a contrast between the vowels in "cot" and "caught," while Californian English pronounces them the same.

4.What is a notable difference in the vowel [eɪ] in Californian English?

Answer: Californian English has a higher vowel (lower first formant) in [eɪ] compared to [ɪ].

5.How are high back vowels pronounced in Californian English?

Answer: The high back vowels in Californian English have a higher second formant, making them seem more towards the front.

6.What is a characteristic pronunciation of the vowel /ʊ/ in some varieties of English spoken in northern cities of the United States?

Answer: In some northern cities like Pittsburgh and Detroit, the vowel /ʊ/ is often pronounced with spread lips.

Topic-136: Vowels in BBC English

7.How do vowels in BBC accent differ from American English?

Answer: Vowels in BBC accent differ in terms of number (20 in total) and quality compared to American English.

8.What is a distinguishing feature of BBC English when it comes to back vowels?

Answer: BBC English distinguishes between three back vowels: [ɑ] as in "father" and "cart," [ɒ] as in "bother" and "cot," and [ɔ] as in "author" and "caught."

9.Why are BBC vowels interesting in relation to English?

Answer: BBC vowels contribute to making it a standard variety of English.

Topic-137: Vowels in Other Languages

10.How do vowel systems in Spanish and Japanese differ from each other?

Answer: Spanish has a simple vowel system with five contrasting vowel sounds, while Japanese also has five vowels but with different qualities and narrower transcription.

11.What is a notable feature of nasal vowels in Urdu and Punjabi?

Answer: Urdu and Punjabi have distinct nasal vowels, where nasality is phonemic, meaning it changes the meaning of words.

Topic-138: Advanced Tongue Root (ATR)

12.What is advanced tongue root (ATR), and where is it found?

Answer: ATR involves the furthest-back part of the tongue opposite the pharyngeal wall, found in languages like Akan spoken in Ghana.

13.How is ATR used phonologically in Akan and other African languages?

Answer: ATR is used as a factor in contrast of vowel harmony in Akan and some other African languages.

Topic-139: Rhotacized Vowels

14.How is rhotacization defined in English phonology?

Answer: Rhotacization refers to the pronunciation of /r/ following a vowel, as found in dialects or accents like "car" and "cart."

15.How are varieties of English divided based on the rhotacization feature?

Answer: Varieties of English are divided into rhotic (having /r/ in all contexts) and non-rhotic (where /r/ is only found before vowels) accents.

CODE: ENG507

OBJECTIVE PART

LESSON 28

1.Nasalization in vowels is a feature found in:

- a) All languages
- b) Urdu and Punjabi only
- c) French and Urdu only
- d) Not covered in the paragraph

2.Which diacritic is used to represent nasalization in the International Phonetic Alphabet (IPA)?

- a) Tilde (~)
- b) Dash (-)
- c) Apostrophe (')
- d) Asterisk (*)

3.Which of the following languages does NOT have nasal vowels?

- a) Urdu
- b) Punjabi
- c) English
- d) French

4.How many nasal vowels does Urdu have?

- a) Four
- b) Five
- c) Six
- d) Seven

5.What is the acoustic correlate for vowel height?

- a) Frequency of formant one
- b) Difference between frequencies of F2 and F1
- c) Frequency of formant three
- d) Lip position

6.Which feature of vowel quality involves the position of the soft palate?

- a) Rounding
- b) Backness
- c) ATR
- d) Nasalization

7.Semivowels in English are phonetically similar to which vowels?

- a) [a] and [e]
- b) [i] and [o]
- c) [u] and [i]
- d) [o] and [u]

8.How many semivowels are found in French?

- a) One
- b) Two
- c) Three
- d) Four

9.Which secondary articulatory gesture involves adding a high front tongue gesture?

- a) Palatalization
- b) Velarization
- c) Pharyngealization

d) Labialization

10.What is the IPA diacritic for velarization?

a) [ʲ]

b) [ʷ]

c) [ʲ]

d) [ɣ]

11.The addition of lip rounding is known as:

a) Palatalization

b) Velarization

c) Pharyngealization

d) Labialization

12.How many secondary articulations are discussed in the paragraph?

a) Two

b) Three

c) Four

d) Five

13.Which secondary articulatory gesture involves the raising of the back of the tongue?

a) Palatalization

b) Velarization

c) Pharyngealization

d) Labialization

14.What is the term used for the process whereby the place of articulation is shifted nearer to the center of the hard palate?

a) Velarization

b) Palatalization

c) Pharyngealization

d) Labialization

15.The superimposition of narrowing of the pharynx is known as:

a) Velarization

b) Palatalization

c) Pharyngealization

d) Labialization

16.Which secondary articulatory gesture involves the addition of lip rounding?

a) Palatalization

b) Velarization

c) Pharyngealization

d) Labialization

17.Labialization can be combined with which of the following secondary articulatory gestures?

a) Palatalization

b) Velarization

c) Pharyngealization

d) All of the above

18. Which secondary articulatory gesture involves the raising of the front of the tongue?

a) Palatalization

b) Velarization

c) Pharyngealization

d) Labialization

19. The main features of palatalization include the raising of the:

a) Back of the tongue

b) Front of the tongue

c) Root of the tongue

d) Lips

20. What is the diacritic used to represent velarization?

a) [ʲ]

b) [ˠ]

c) [ɨ]

d) [ɣ]

21. Which secondary gesture involves the retracting of the root of the tongue?

a) Palatalization

b) Velarization

c) Pharyngealization

d) Labialization

22. Labialization involves the rounding of the:

- a) Back of the tongue
- b) Front of the tongue
- c) Lips
- d) Soft palate

23. Which of the following is NOT a secondary articulatory gesture discussed in the paragraph?

- a) Palatalization
- b) Velarization
- c) Pharyngealization
- d) Laryngealization

24. Labialization can be combined with which primary articulation?

- a) Velarization
- b) Palatalization
- c) Pharyngealization
- d) None of the above

25. Which book is mentioned as a further reading on this topic?

- a) A Course in Phonetics by Peter Ladefoged and Keith Johnson
- b) English Phonetics and Phonology - A Practical Course by Peter Roach
- c) Introduction to Linguistics by George Yule

d) The Sounds of Language by Elizabeth C. Zsiga

CODE: ENG507

SUBJECTIVE PART

LESSON 28

1.What is nasalization in vowels?

Nasalization in vowels is a feature where air escapes through the nose while pronouncing a vowel sound.

2.Which languages have nasal vowels?

Urdu, Punjabi, French, and many other Indo-Aryan languages have nasal vowels.

3.How is nasalization represented in the International Phonetic Alphabet (IPA)?

Nasalization is represented by the tilde symbol [~] placed above the vowel symbol.

4.What are the two primary features of vowel quality?

The two primary features of vowel quality are height and backness of the tongue.

5.Which four features of vowel quality are used less frequently in languages?

The four features used less frequently in languages are lip-rounding, rhotacization, nasalization, and advanced tongue root (ATR).

6.What is the acoustic correlate for vowel height?

The acoustic correlate for vowel height is the frequency of the first formant (F1), which is inversely related to F1.

7.How is rhotacization related to vowel quality?

Rhotacization is a feature of vowel quality that involves the frequency of the third formant.

8.What does the term "semivowels" refer to?

Semivowels refer to a class of sounds in many languages that function like consonants but have vowel-like qualities.

9.Give examples of semivowels in English.

Examples of semivowels in English are /w/ (as in "wet") and /j/ (as in "yet").

10.What is the term used for the addition of lip rounding to a primary articulation?

The term used for the addition of lip rounding to a primary articulation is labialization.

11.How is palatalization represented in the IPA?

Palatalization is represented by the small [j] diacritic superimposed above another symbol.

12.What is the term for the raising of the back of the tongue in vowel quality?

The term for the raising of the back of the tongue in vowel quality is velarization.

13.Which sound in English demonstrates velarization?

The /l/ sound at the end of a syllable, as in words like "kill" and "pill," demonstrates velarization.

14.What is the IPA diacritic used to symbolize pharyngealization?

The IPA diacritics used to symbolize pharyngealization are [ˤ] and [ʕ].

15.How many secondary articulations can a sound have simultaneously?

A sound can have multiple secondary articulations simultaneously, including labialization, palatalization, and velarization.

16.What is the term for the raising of the front of the tongue in vowel quality?

The term for the raising of the front of the tongue in vowel quality is palatalization.

17.How is the raising of the back of the tongue represented in IPA?

The raising of the back of the tongue, velarization, is represented by the diacritics [ɰ] and [ˑ].

18.What is the primary articulation affected by pharyngealization?

Pharyngealization affects the root of the tongue.

19.How is labialization represented in the IPA?

Labialization is represented by the diacritic [ʷ] added to the primary articulation symbol.

20.Can labialization be combined with other secondary articulations?

Yes, labialization can be combined with other secondary articulations, even if the sound itself is labial, such as [mʷ].

1.What does the term "suprasegmental" refer to in phonetics and phonology?

- a) Sounds that extend over more than one segment
- b) Sounds that are below the segmental level
- c) Sounds that are independent of segments
- d) Sounds that are meaningless in speech

2.Which of the following is NOT considered a major suprasegmental feature?

- a) Pitch
- b) Stress
- c) Consonants
- d) Intonation

3.What is the relationship between segmental phonology and suprasegmental phonology?

- a) They are separate fields of study.
- b) They are two branches of the same field.
- c) Segmental phonology is a subset of suprasegmental phonology.
- d) Suprasegmental phonology is a subset of segmental phonology.

4.How many phonemes must a syllable have?

- a) At least one
- b) At least two

- c) At least three
- d) At least four

5. How can a syllable be divided in terms of its phonemes?

- a) Onset, nucleus, and coda
- b) Initial, medial, and final
- c) Pre-stress, stress, and post-stress
- d) Consonants and vowels

6. What is the relationship between syllables and speech production?

- a) Syllables consist of vowel-like states only.
- b) Syllables consist of consonant-like states only.
- c) Syllables consist of a movement between vowel-like and consonant-like states.
- d) Syllables consist of completely silent states.

7. What is the acoustic characteristic of a syllable?

- a) A series of peaks of energy corresponding to vowel-like states
- b) A series of troughs of lower energy corresponding to consonant-like states
- c) A series of rapid changes in pitch corresponding to tone
- d) A series of pauses corresponding to juncture

8. What is the term for the combination of the nucleus and coda in a syllable?

- a) Onset
- b) Rhyme
- c) Peak
- d) Nucleus

9. What is the study of the sequences of phonemes called?

- a) Phonetics
- b) Phonology
- c) Syllabics

d) Phonotactics

10. Which type of syllable structure includes consonant clusters at the edges?

- a) Simple
- b) Moderate
- c) Complex
- d) Compound

11. How many syllables does the word "minimization" have?

- a) One
- b) Two
- c) Three
- d) Four

12. What factors make a syllable stressed?

- a) Loudness, rise in pitch, length of duration, and vowel quality
- b) Softness, fall in pitch, shortness of duration, and consonant quality
- c) Loudness, fall in pitch, length of duration, and consonant quality
- d) Softness, rise in pitch, shortness of duration, and vowel quality

13. What role does stress play in conveying meaning?

- a) It changes the grammatical category of a word.
- b) It changes the pronunciation of a word.
- c) It changes the meaning of a word.
- d) It changes the stress pattern of a sentence.

14. How many levels of stress are found in some descriptions of languages?

- a) One
- b) Two
- c) Three
- d) More than three

15. What is the term for stress applied at the syllable level that can change the meaning and grammatical category of a word?

- a) Lexical stress
- b) Emphatic stress
- c) Sentence stress
- d) Primary stress

16. Where is sentence-level stress applied in a sentence?

- a) On every word
- b) On the first word
- c) On the last word
- d) On one word

17. What is the role of sentence-level stress in intonation patterns?

- a) It indicates a question.
- b) It indicates emphasis or contrast.
- c) It indicates a statement.
- d) It indicates a command.

18. Which of the following sentences demonstrates a shift in emphasis through stress?

- a) "Did YOU drive to Peshawar last weekend?"
- b) "Did you DRIVE to Peshawar last weekend?"

c) "Did you drive to PESHAWAR last weekend?"

d) "Did you drive to Peshawar LAST weekend?"

Answer: All of the above.

19.What book is recommended for further readings on stress and syllables?

a) A Course in Phonetics by Peter Ladefoged and Keith Johnson

b) English Phonetics and Phonology-A Practical Course by Peter Roach

c) The Phonetics and Phonology of Stress by John Smith

d) Introduction to Suprasegmental Features by Jane Brown

20.Where can online sources on syllables be found?

a) en.wikipedia.org

b) educationcing.blogspot.com

c) Both a) and b)

d) Neither a) nor b)

21.Which feature extends over more than one sound in an utterance?

a) Suprasegmental

b) Segmental

c) Subsegmental

d) Ultrasegmental

22.What are the major suprasegmental features?

a) Pitch, stress, tone, intonation, juncture

b) Vowels, consonants, syllables, words, sentences

c) Stops, fricatives, affricates, liquids, nasals

d) Manner, place, voicing, aspiration, length

23.What is the primary stress in the word "indicator"?

- a) On the first syllable
- b) On the second syllable
- c) On the third syllable
- d) On the fourth syllable

24.How many levels of stress are typically used in English?

- a) Two
- b) Three
- c) Four
- d) Five

25.What type of stress can change the meaning and grammatical category of a word?

- a) Lexical stress
- b) Sentence stress
- c) Primary stress
- d) Secondary stress

Answer: a) Lexical stress

CODE: ENG507

SUBJECTIVE PART

LESSON 29

1.What does the term "suprasegmental" refer to?

Suprasegmental refers to vocal effects that extend over more than one sound (segment) in an utterance.

2.What are some examples of major suprasegmental features?

Pitch, stress, tone, intonation, and juncture are examples of major suprasegmental features.

3.How are phonological studies divided in terms of suprasegmental features?

Phonological studies are divided into segmental phonology and suprasegmental phonology.

4.How can syllables be defined?

Syllables are the parts of words that consist of vowel-like and consonant-like sounds, and they are the basic units of speech.

5.What are the three possible parts of a syllable?

A syllable can have an onset (beginning), nucleus (peak), and coda (ending).

6.What is the minimum requirement for a syllable?

A syllable must have a nucleus (at least one phoneme).

7.What is the significance of syllables in language?

Syllables are claimed to be the most basic units in speech, and every language has syllables.

8.How can syllable structure be categorized?

Syllable structure can be categorized as simple (CV), moderate (CVC), or complex (with consonant clusters at edges).

9.What is stress?

Stress is a suprasegmental feature applied to a whole syllable to make it prominent through factors like loudness, pitch rise, duration, and vowel quality.

10.What role does stress play in conveying meaning?

Stress plays an important role in conveying and changing meaning in language.

11.How many levels of stress can languages have?

Languages can have different numbers of stress levels, ranging from just two levels (stressed and unstressed) to more complex systems.

12.What are the primary, secondary, and tertiary stresses?

In English, the first syllable is primarily stressed, the third syllable is secondarily stressed, and the second and fourth syllables are weakly stressed or unstressed.

13.How does stress affect the meaning of words in English?

Stress can change the meaning and grammatical category of words in English, such as "INSult" (noun) versus "inSULT" (verb).

14.What is the distinction between lexical stress and sentence-level stress?

Lexical stress refers to stress applied at the syllable level, affecting the meaning and category of a word. Sentence-level stress is applied to a word in a sentence, making it more prominent than other words.

15.What is the role of sentence-level stress in intonation patterns and rhythmic features?

Sentence-level stress contributes to intonation patterns and rhythmic features, emphasizing specific words and highlighting information in context.

16.What is the purpose of shifting stress in the provided example sentences?

Shifting stress in the example sentences demonstrates the role of stress in changing emphasis and affecting the meaning and context of the sentence.

17.What are some recommended readings for further information on these topics?

Chapter 10 of the textbook "A Course in Phonetics" by Peter Ladefoged and Keith Johnson and chapters 8 to 11 of the additional reading book "English Phonetics and Phonology-A Practical Course" by Peter Roach are recommended. Online sources like Wikipedia and the Education Cing blog can also provide additional information.

18.What are some examples of suprasegmental features?

Examples of suprasegmental features include pitch, stress, tone, intonation, and juncture.

19.What is the role of syllables in speech production?

Syllables involve a movement from a constricted or silent state to a vowel-like state and then back to a constricted or silent state, contributing to the flow of speech.

20.How are suprasegmental features meaningful in language?

Suprasegmental features are meaningful when applied above the segmental level, influencing the interpretation and expression of utterances.

CODE: ENG507

OBJECTIVE PART

LESSON 30

1.What are the two broad categories of languages based on their modes of timing?

- a) Stress timed and syllable timed
- b) Stressed and unstressed
- c) Rhythmic and non-rhythmic
- d) Accentuated and non-accentuated

2.Which feature dominates the rhythmic pattern in stress timed languages?

- a) Syllable count
- b) Pitch variation
- c) Stressed patterns
- d) Unstressed patterns

3.What is the characteristic of stress-timed languages?

- a) Stressed syllables occur at irregular intervals
- b) Unstressed syllables occur at regular intervals
- c) Stressed syllables recur at regular intervals
- d) Unstressed syllables recur at irregular intervals

4.What is another term used to describe the regularity of stressed syllables in stress-timed languages?

- a) Syllabism
- b) Isochronism
- c) Suprasegmental

d) Isosyllabicity

5. Which language is given as an example of a stress-timed language?

a) Japanese

b) Spanish

c) Czech

d) Polish

6. How is the rhythm of syllable-timed languages characterized?

a) Stressed syllables occur at regular intervals

b) Unstressed syllables occur at regular intervals

c) Syllables have equal time value

d) Pitch variation is prominent

7. Which language is mentioned as an example of a syllable-timed language?

a) English

b) German

c) French

d) Japanese

8. What do phoneticians often doubt about syllable-timed languages?

a) Whether any language is truly syllable-timed

b) The accuracy of isosyllabism

c) The usefulness of rhythm typology

d) The applicability of regular intervals

9. What term is used to describe the pronunciation of languages displaying a particular rhythmic pattern?

a) Suprasegmental

b) Isosyllabicity

c) Phonetics

d) Phonology

10.What does pitch refer to as a suprasegmental feature?

a) Variation in vocal fold vibration

b) Syllable count in tonal languages

c) Regularity of stressed syllables

d) Phonological patterns in stress-timed languages

11.In tonal languages, how is pitch used in the pronunciation of words?

a) It determines the syllable count

b) It affects the stress pattern

c) It changes the meaning of words

d) It influences the intonation

12.What is the role of pitch in most languages, regardless of being tone languages or not?

a) It determines syllable timing

b) It affects the suprasegmental features

c) It plays a central role in intonation

d) It alters the syllable stress patterns

13.According to the paragraph, what is the variation in the vibration of vocal folds referred to as?

a) Rhythmic patterns

b) Suprasegmental features

c) Isosyllabism

d) Fundamental frequency

14. Which book provides additional reading on the topic of phonetics and phonology?

- a) A Course in Phonetics by Peter Ladefoged and Keith Johnson
- b) English Phonetics and Phonology-A Practical Course by Peter Roach
- c) Phonetics and Phonology: A Comprehensive Guide by John Clark
- d) The Articulate Voice: An Introduction to Voice and Diction by Lynn K. Wells

15. Which category of languages is not based on strong concepts according to the paragraph?

- a) Stress timed and syllable timed languages
- b) Fixed word stress, variable word stress, and fixed phrase stress languages
- c) Tonal and non-tonal languages
- d) Phonetics and phonology

16. What are the three dimensions proposed by some phoneticians for categorizing languages?

- a) Syllable count, word stress, and phrase stress
- b) Stress timed, syllable timed, and tonal
- c) Fixed word stress, variable word stress, and fixed phrase stress
- d) Pitch, rhythm, and phonological patterns

17. Which of the following books is mentioned as a source for further reading on the topic?

- a) A Course in Phonetics by Peter Ladefoged and Keith Johnson
- b) English Phonetics and Phonology-A Practical Course by Peter Roach
- c) Introduction to Phonetics and Phonology by John Clark and Colin Yallop
- d) An Introduction to Phonetics and Phonology by John Clark and Colin Yallop

18.What is the term used to describe the regular occurrence of syllables at equal intervals of time in syllable-timed languages?

- a) Rhythmic patterns
- b) Suprasegmental features
- c) Isosyllabism

d) Isosyllabicity

19.What aspect of the rhythmic pattern in stress-timed languages changes particularly at the sentence level?

- a) Stressed patterns
- b) Syllable count
- c) Pitch variation

d) Word stress

20.Which online source is mentioned for further readings on the topic?

- a) <http://slideplayer.com/slide/3885548/>
- b) <https://www.slideshare.net/shassan573/pronunciation-39434371>
- c) http://ec-concord.ied.edu.hk/phonetics_and_phonology/wordpress/?page_id=443
- d) All of the above

CODE: ENG507

SUBJECTIVE PART

LESSON 30

Question 1:

What are the two broad categories into which languages are divided based on their rhythmic patterns?

Answer:

The two broad categories are stress-timed languages and syllable-timed languages.

Question 2:

How are stress-timed languages characterized?

Answer:

Stress-timed languages have stress as their dominating rhythmic feature, where stressed syllables occur at equal intervals of time.

Question 3:

What is another term used to describe the regularity of stressed syllables in stress-timed languages?

Answer:

The regularity of stressed syllables in stress-timed languages is sometimes referred to as "isochronism" or isochrony.

Question 4:

In stress-timed languages, how is the division among syllables made?

Answer:

The division among syllables in stress-timed languages is made based on stressed and unstressed patterns.

Question 5:

What is the general phrase used in phonetics to characterize languages with a particular type of rhythmic pattern opposed to syllable-timed languages?

Answer:

The general phrase used is "stress timed languages".

Question 6:

How is rhythm in syllable-timed languages defined?

Answer:

In syllable-timed languages, all syllables tend to have an equal time value or duration.

Question 7:

What is the contrast between stress-timing and syllable-timing in terms of the time intervals between stressed syllables?

Answer:

In stress-timing, the time between stressed syllables tends to be equal irrespective of the number of unstressed syllables, whereas in syllable-timing, syllables occur at regular intervals of time with fixed word stress.

Question 8:

Which languages are often claimed to be syllable-timed?

Answer:

Czech, Polish, Swahili, and Romance languages (e.g., Spanish and French) are often claimed to be syllable-timed.

Question 9:

What is the term used to describe the regularity of syllables in syllable-timed languages?

Answer:

The regularity of syllables in syllable-timed languages is sometimes referred to as "isosyllabism" or isosyllabicity.

Question 10:

How is pitch defined as a suprasegmental feature?

Answer:

Pitch is an auditory sensation that corresponds to the frequency of vibration of the vocal folds and is used as an essential component of word pronunciation in tonal languages.

Question 11:

What role does pitch play in most languages?

Answer:

In most languages, pitch plays a central role in intonation.

Question 12:

What are the three dimensions of word stress proposed by some phoneticians?

Answer:

The three dimensions of word stress proposed by some phoneticians are fixed word stress, variable word stress, and fixed phrase stress.

Question 13:

What is the variation in the vibration of vocal folds referred to as?

Answer:

The variation in the vibration of vocal folds is referred to as pitch.

Question 14:

What are some recommended sources for further readings on stress timed languages and pitch as a suprasegmental feature?

Answer:

Chapter 10 of the textbook "A Course in Phonetics" by Peter Ladefoged and Keith Johnson, and chapters 15 to 19 of the additional reading book "English Phonetics and Phonology-A Practical Course" by Peter Roach are recommended sources.

Online sources include:

<http://slideplayer.com/slide/3885548/>

<https://www.slideshare.net/shassan573/pronunciation-39434371>

[http://ec-](http://ec-concord.ied.edu.hk/phonetics_and_phonology/wordpress/?page_id=443)

[concord.ied.edu.hk/phonetics_and_phonology/wordpress/?page_id=443](http://ec-concord.ied.edu.hk/phonetics_and_phonology/wordpress/?page_id=443)

Question 15:

What is the purpose of referring to the vibration frequency as fundamental frequency?

Answer:

Referring to the vibration frequency as fundamental frequency helps

CODE: ENG507

OBJECTIVE PART

LESSON 31,32

1.What are suprasegmental features?

- a) Features related to individual speech sounds
- b) Features related to grammar and syntax
- c) Features related to tone and pitch
- d) Features related to articulatory movements

2.What is the linguistic function of tone in tonal languages?

- a) To change the meaning of a word
- b) To indicate grammatical structure
- c) To convey emotions and attitudes
- d) To regulate turn-taking in conversation

3. In Mandarin Chinese, how does tone affect the meaning of the word "ma"?

- a) High pitch means 'mother,' low rising tone means 'hemp'
- b) Low pitch means 'mother,' high rising tone means 'hemp'
- c) High pitch means 'hemp,' low rising tone means 'mother'
- d) Low pitch means 'hemp,' high rising tone means 'mother'

4. In non-tonal languages, what role does tone play?

- a) It forms the central part of intonation
- b) It changes the meaning of individual syllables
- c) It indicates grammatical categories
- d) It spreads over many syllables

5. How is tone usually identified in tone languages?

- a) As a property of individual syllables
- b) As a property of intonational phrases
- c) As a property of grammar and syntax
- d) As a property of consonant clusters

6. In the analysis of English intonation, what does tone refer to?

- a) The variations in pitch used to convey or alter meaning
- b) The patterns of pitch used in tonal languages
- c) The rhythm and stress patterns of speech
- d) The variations in loudness and tempo

7. What is the main function of intonation in language?

- a) To act as a signal of grammatical structure
- b) To convey emotions and attitudes
- c) To regulate turn-taking in conversation

d) To change the meaning of individual words

8.How does intonation distinguish between questions and statements?

a) By using rising and falling pitch patterns

b) By emphasizing certain words in a sentence

c) By changing the tempo and loudness of speech

d) By using different consonant clusters

9.Apart from conveying meaning and grammatical structure, what else can intonation convey?

a) Personal attitudes and emotions

b) Syntactic boundaries and phrase-level boundaries

c) Social background and cultural heritage

d) Articulatory movements and tongue placement

10.What are some other suprasegmental features related to intonation?

a) Voice quality, tempo, and loudness

b) Consonant clusters and vowel sounds

c) Syllable stress and syllable length

d) Grammar rules and syntactic structure

11.How does intonation contribute to conversational discourse?

a) By indicating new or old information

b) By regulating turn-taking and establishing dominance

c) By eliciting co-operative responses

d) All of the above

12.Why is the intonation of languages other than English less explored?

a) There are fewer tone languages in the world

- b) Researchers focus more on English language studies
- c) Different languages have different intonation patterns
- d) Analyzing intonation in other languages is challenging

13.What is the International Phonetic Alphabet (IPA)?

- a) A system of symbols and diacritics for phonetic transcription
- b) A chart that covers all types of phonetic descriptions
- c) A list of linguistic phonetic rules and principles
- d) A publication by the International Phonetic Association

14.What does the IPA chart primarily represent?

- a) The phonetics of individual speakers
- b) The phonetics of the linguistic community
- c) The phonetics of tonal languages
- d) The phonetics of non-tonal languages

15.Why are some cells on the IPA chart left blank?

- a) They represent sounds that do not exist in any language
- b) They indicate combinations of categories yet to be discovered
- c) They signify sounds that are not possible in human speech
- d) They represent sounds that have not been observed in tonal languages

16.What types of suprasegmental features are included in the IPA chart?

- a) Tone, intonation, stress, and length
- b) Articulatory gestures and consonant clusters
- c) Vowel sounds and syllable stress patterns
- d) Sentence-level boundaries and syntactic structure

17.What is the main purpose of the IPA chart?

- a) To provide a comprehensive analysis of all languages
- b) To cover all possible types of phonetic descriptions
- c) To capture the linguistic phonetics of the community
- d) To document the phonetics of individual speakers

18. How often is the IPA chart revised and updated?

- a) Rarely, as it represents universal phonetic knowledge
- b) Occasionally, to include new sounds and discoveries
- c) Annually, to reflect changes in linguistic phonetics
- d) It remains unchanged since its initial publication

19. What is the focus of linguistic phonetic description?

- a) The phonetics of individual speakers
- b) The phonetics of non-tonal languages
- c) The phonetics of tonal languages
- d) The phonetics of the linguistic community

20. What aspect of speech production and perception does cognitive phonetics focus on?

- a) The articulatory movements involved in speech
- b) The shared knowledge of sound systems in languages
- c) The individual variations in speech sounds
- d) The impact of intonation on sentence meaning

21. What distinguishes linguistic phonetics from cognitive phonetics?

- a) The focus on shared knowledge vs. individual variations
- b) The study of articulatory movements vs. perception
- c) The exploration of intonation vs. speech production

d) The application of IPA symbols vs. spectrograms

22. What does linguistic phonetic description focus on?

a) The phonetics of the individual

b) The phonetics of grammar and syntax

c) The phonetics of the linguistic community

d) The phonetics of tonal languages

23. What is the main reason for considering the phonetics of the community in descriptions?

a) Individual speakers differ in interesting ways

b) It allows for the study of private knowledge

c) It captures what community members accept as correct pronunciation

d) The phonetics of the individual is easier to describe

24. When is the phonetics of the individual considered?

a) When studying grammar and syntax

b) When analyzing suprasegmental features

c) When focusing on speech elicitation

d) When describing consonant clusters

25. How is the IPA chart continuously updated?

a) Through input from linguistic communities worldwide

b) Through collaboration with speech technology experts

c) Through regular surveys and questionnaires

d) Through the work of experts in the field

26. What does the IPA chart include besides consonant and vowel symbols?

a) Symbols for suprasegmental features

- b) Symbols for individual phonetic strategies
- c) Symbols for speech rhythm and tempo
- d) Symbols for syntax and grammar rules

27. How are sounds that have not been observed in any language represented on the IPA chart?

- a) They are shaded on the chart
- b) They are left blank on the chart
- c) They are represented with special diacritics
- d) They are marked as potential but unattested sounds

28. In the context of the IPA, what does the term "co-articulation" refer to?

- a) The interaction between consonant and vowel sounds
- b) The articulatory gestures involved in speech production
- c) The variations in loudness and tempo of speech
- d) The establishment of dominance in conversation

29. Why is the phonetics of languages other than English less explored?

- a) There are fewer phonetic resources available for other languages
- b) Researchers tend to focus more on English language studies
- c) Different languages have unique phonetic features and patterns
- d) Analyzing intonation in other languages is less significant

30. What is one challenge in analyzing intonation in tone languages?

- a) Tone languages lack suprasegmental features
- b) Tone languages have limited phonetic resources
- c) Tone languages require different descriptive frameworks
- d) Tone languages have a restricted range of pitch variation

Q1: What are some examples of suprasegmental features?

A: Intonation, tone, and pitch are examples of suprasegmental features.

Q2: How does tone function in tonal languages?

A: In tonal languages, tone is used to change the meaning of a word.

Q3: Give an example of a tonal language and how tone changes the meaning of a word.

A: Mandarin Chinese is a tonal language. For example, in Mandarin Chinese, [ma] said with a high pitch means 'mother,' while [ma] said on a low rising tone means 'hemp.'

Q4: What is the difference between tone in tonal languages and tone in non-tonal languages?

A: In tonal languages, tones are a property of individual syllables, while in non-tonal languages, tone forms the central part of intonation and can affect the interpretation of a sentence.

Q5: How is tone analyzed in the context of English intonation?

A: In the analysis of English intonation, tone refers to one of the pitch possibilities for the tonic (or nuclear) syllable.

Q6: How many types of tone are usually used in the analysis of English intonation?

A: A set of four types of tone is usually used in the analysis of English intonation: fall, rise, fall-rise, and rise-fall.

Q7: Apart from pitch, what other features are included in the broader sense of intonation?

A: In its broader sense, intonation includes voice quality, tempo, and loudness.

Q8: What are some functions of intonation in a language?

A: Intonation acts as a signal of grammatical structure, indicates syntactic boundaries, distinguishes between grammatical structures (e.g., questions and statements), conveys personal attitude, and signals social background of speakers.

Q9: How does intonation contribute to conveying personal attitude?

A: Intonation can convey personal attitudes such as sarcasm, puzzlement, anger, etc.

Q10: What are the three variables that are generally distinguished in intonation?

A: The three variables are pitch range, height, and direction.

Q11: What is an intonational phrase?

A: An intonational phrase is a structured hierarchy of intonational constituents in conversation, often recognized as an utterance span dominated by boundary tones.

Q12: How does intonation contribute to conversational discourse?

A: Intonation indicates whether the information is new or old, regulates turn-taking, establishes dominance, and elicits cooperative responses in conversation.

Q13: Is intonation studied extensively in languages other than English?

A: Much less work has been done on the intonation of languages other than English.

Q14: What is the International Phonetic Association (IPA)?

A: The International Phonetic Association (IPA) is an organization that establishes principles and symbols for phonetic transcription.

Q15: What does the IPA chart consist of?

A: The IPA chart consists of symbols and diacritics officially approved by the IPA, including consonant and vowel charts, symbols for suprasegmental features, and diacritics.

Q16: Does the IPA chart cover all possible types of phonetic descriptions?

A: No, the IPA chart is limited to sounds that can have linguistic significance and change the meaning of words in some languages.

Q17: Why are some cells on the IPA chart left blank?

A: Blank cells on the IPA chart indicate combinations of categories that are humanly possible but have not been observed to be distinctive in any language.

Q18: What do shaded cells on the IPA chart represent?

A: Shaded cells on the IPA chart represent sounds that are not possible at those places.

Q19: What are the potentialities reflected in the IPA chart?

A: The IPA chart reflects the potentialities of human speech sounds, including segments, suprasegmental features, airstream mechanisms, coarticulations, and secondary articulatory gestures.

Q20: How is the IPA chart continuously updated?

A: The IPA chart is carefully documented and continuously revised and updated by experts.

Q21: What is linguistic phonetics?

A: Linguistic phonetics is an approach that focuses on the principles of the International Phonetic Association (IPA) and provides a descriptive framework for formal phonological theory.

Q22: What does linguistic phonetics explore?

A: Linguistic phonetics explores speech production and perception, the relationship between phonetics and phonology, and the sound systems of languages.

Q23: What is the focus of linguistic phonetic description?

A: The focus of linguistic phonetic description is the phonetics of the community, considering the shared properties of the sound system of a language by its native speakers.

Q24: How does linguistic phonetic description relate to individual speakers?

A: Linguistic phonetic descriptions are mainly focused on the phonetics of the community, while the phonetics of the individual are considered for specific purposes when required.

Q25: Why is the phonetics of the community emphasized in linguistic phonetic descriptions?

A: Individual speakers differ in their speech productions, and the phonetics of the community captures what members of the community accept as the correct pronunciation system.

Q26: What is the International Phonetic Alphabet (IPA)?

A: The International Phonetic Alphabet (IPA) is a set of symbols and diacritics used to represent the sounds of human language.

Q27: What is the purpose of the IPA chart?

A: The IPA chart provides a standardized representation of speech sounds and suprasegmental features, facilitating cross-linguistic comparison and analysis.

Q28: Does the IPA chart cover all phonetic possibilities in languages?

A: No, the IPA chart focuses on sounds that have linguistic significance and can change the meaning of words in languages.

Q29: What does the IPA chart indicate about possible sound combinations?

A: The IPA chart indicates combinations of categories that are humanly possible but may not be observed as distinctive in any language.

Q30: How is the IPA chart continuously updated?

A: The IPA chart is continuously revised and updated by experts to reflect new findings and insights in phonetics and phonology.

CODE: ENG507

OBJECTIVE PART

LESSON 33,34

1.What is the main topic discussed in the paragraph?

- a) Controlling articulatory movements
- b) Feature hierarchy
- c) Problems with linguistic explanations
- d) Memory for speech

2.What does the term "feature hierarchy" refer to in phonetics and phonology?

- a) The arrangement of linguistic phonetic features in a hierarchical structure
- b) The classification of speech sounds based on articulatory maneuver
- c) The description of supra-laryngeal and laryngeal characteristics
- d) The division of sounds based on place and manner of articulation

3.What does the feature [bilabial] indicate about a speech segment?

- a) It involves lip movement but not both lips
- b) It involves both lips in the articulation
- c) It indicates the presence of nasality
- d) It is a lateral sound

4.According to the paragraph, how many major regions of the vocal tract are used for dividing speech sounds through feature hierarchy?

- a) Two
- b) Three

c) Four

d) Five

5.How many principal features are associated with the categories "Approximant" and "Vowel"?

a) Two

b) Three

c) Four

d) Five

6.What does the term "assimilation" refer to in the context of phonetics?

a) The tendency of adjacent sounds to share phonetic properties

b) The classification of speech sounds based on articulatory complexity

c) The interaction of speech perception and production

d) The explanation of language sound patterns

7.According to the paragraph, what problem arises when explanations are restricted to the terminology and knowledge base of linguistic phonetics?

a) Lack of phonetic invariance

b) Fallacy of reification

c) Lack of explanation for language sound patterns

d) Lack of consideration for individual variation in speech production

8.What approach focuses on how experiences are encoded in memory regarding speech?

a) Phonetic implementation approach

b) Optimality theory

c) Exemplar theory

d) Phonological features approach

9.What role does memory for speech play in the exemplar theory?

- a) Memorization of detailed phonetic definitions
- b) Memorization of speaking styles
- c) Memorization of sound change patterns
- d) Memorization of phonetic variability

10.According to the paragraph, what is the goal of speakers when using language sounds?

- a) To maximize ease of articulation
- b) To achieve maximum perceptual separation
- c) To minimize coarticulation and secondary articulation
- d) To produce very clear speech

11.What is the phenomenon called when adjacent sounds affect each other's pronunciation?

- a) Assimilation
- b) Perceptual separation
- c) Articulatory effort
- d) Phonetic variability

12.Which factor influences the range of phonetic forms produced and heard by individuals?

- a) Lack of phonetic invariance
- b) Sociolinguistic features
- c) Phonetic implementation view
- d) Language universal features

13.What principle accounts for maintaining a balance between the requirements of the speaker and listener in language?

- a) Maximum ease of articulation
- b) Maximum perceptual separation
- c) Phonetic implementation approach
- d) Exemplar theory

14. What is the term used to describe the gradual shift in sound change across the whole lexicon?

- a) Phonetic variability
- b) Phonetic invariance
- c) Phonetic implementation
- d) Perceptual separation

15. What is the primary focus of the paragraph?

- a) Defining and commenting on 'feature hierarchy'
- b) Explaining problems with linguistic explanations
- c) Discussing controlling articulatory movements
- d) Exploring memory for speech

16. According to the paragraph, what muscles are involved in producing the sound [p]?

- a) Larynx muscles
- b) Tongue muscles
- c) Chest and abdomen muscles
- d) Lip and jaw muscles

17. How does the phonetic implementation approach explain the storage of words in speech memory?

- a) Words are stored in their most basic phonetic form
- b) Words are computed based on exemplars

- c) Words are stored as linguistic phonetic explanations
- d) Words are stored in their specific regional variants

18.What is the principle of "maximum perceptual separation" concerned with?

- a) Achieving phonetic invariance
- b) Minimizing articulatory effort
- c) Maintaining contrastive vowel sounds
- d) Encouraging historical sound changes

19.What does the lack of phonetic invariance imply for language engineers?

- a) Difficulty in recognizing speech patterns
- b) Ease in producing phonetic variability
- c) Challenges in storing words in memory
- d) Problems in computing linguistic phonetics

20.What does the concept of "exemplar theory" propose about sound change?

- a) Sound change is phonetically gradual and affects the whole lexicon.
- b) Sound change is a result of physiological constraints on speaking.
- c) Sound change is a consequence of linguistic universals.
- d) Sound change is influenced by language-specific features.

21.What is the main focus of the paragraph?

- a) Defining and commenting on 'feature hierarchy'
- b) Explaining problems with linguistic explanations
- c) Discussing controlling articulatory movements
- d) Exploring memory for speech

22.How does the phonetic implementation view explain the storage of words in memory?

- a) Words are stored as broad phonetic classes.
- b) Words are stored with their detailed phonetic definitions.
- c) Words are stored as instances with phonetic variability.
- d) Words are stored based on community norms.

23.What is the primary concern of speakers and listeners regarding language sounds?

- a) Maximizing articulatory effort
- b) Minimizing perceptual separation
- c) Balancing ease of articulation and perceptual contrast
- d) Achieving complete phonetic invariance

24.According to the paragraph, how does the principle of "maximum ease of articulation" affect language sounds?

- a) It results in assimilation between adjacent sounds.
- b) It leads to increased coarticulation and secondary articulation.
- c) It influences historical sound changes in a language.
- d) It ensures phonetic variability in speech production.

25.What does the term "exemplar theory" propose about generalization and productivity?

- a) Generalization is possible within productivity.
- b) Generalization is limited to phonetic invariants.
- c) Productivity is the least developed aspect of linguistic knowledge.
- d) Productivity relies on memorizing detailed phonetic definitions.

26.What is the main topic discussed in the paragraph?

- a) Controlling articulatory movements
- b) Feature hierarchy

- c) Problems with linguistic explanations
- d) Memory for speech

27. What is the role of memory for speech according to the paragraph?

- a) Memorizing physiological constraints on speaking
- b) Memorizing linguistic universals and community norms
- c) Memorizing detailed phonetic definitions of words
- d) Memorizing phonetic variability and speech styles

28. According to the paragraph, what is the focus of the speaker when using language sounds?

- a) Achieving maximum perceptual separation
- b) Reducing articulatory effort for ease of production
- c) Balancing phonetic forces in pronunciation changes
- d) Ensuring complete phonetic invariance in speech

29. What is the phenomenon called when adjacent sounds influence each other's pronunciation in words?

- a) Assimilation
- b) Coarticulation
- c) Phonetic variability
- d) Historical sound change

30. What is the primary concern when maintaining a balance between the requirements of the speaker and listener in language?

- a) Articulatory complexity
- b) Maximum ease of articulation
- c) Perceptual contrast and ease of articulation
- d) Linguistic universals and community norms

Answer: c

CODE: ENG507

SUBJECTIVE PART

LESSON 33,34

1.What is feature hierarchy?

Feature hierarchy is a concept in phonetics and phonology that organizes linguistic phonetic features based on the properties and features of sounds.

2.How are features listed in a feature hierarchy?

Features are listed in a hierarchy with nodes in the hierarchy defining ever more specific phonetic properties.

3.What are the major regions of the vocal tract used for dividing speech sounds?

The major regions of the vocal tract used for dividing speech sounds are Labial, Coronal, Dorsal, Radical, and Glottal.

4.What are the three possibilities within the Coronal articulations?

The three possibilities within the Coronal articulations are Laminal (blade of the tongue), Apical (tip of the tongue), and Sub-apical (under part of the blade of the tongue).

5.What are the four major features that depend on the degree of closure of the articulators?

The four major features that depend on the degree of closure of the articulators are Stop, Fricative, Approximant, and Vowel.

6.How many values does the feature 'Stop' have?

The feature 'Stop' has only one possible value, which is [stop].

7.How many values does the feature 'Fricative' have?

The feature 'Fricative' has two possible values, [sibilant] and [nonsibilant].

8.How many principal features do 'Approximant' and 'Vowel' have?

'Approximant' and 'Vowel' have five principal features: Height, Backness, Protrusion, Compression, and Tongue Root.

9.How many values does the 'Tongue Root' feature have?

The 'Tongue Root' feature has two possible values: [+ATR] and [–ATR].

10.How many values does the 'Rhotic' feature have?

The 'Rhotic' feature has only one possible value, [rhotacized].

11.What are the five main features of 'Laryngeal' possibilities?

The five main features of 'Laryngeal' possibilities are [voiceless], [breathy voice], [modal voice], [creaky voice], and [closed] (forming a glottal stop).

12.How many values do the Airstream features have?

The Airstream features have three values: Pulmonic, Velaric, and Glottalic.

13.What are some phonetic research trends and theories focused on besides linguistic phonetics?

Some phonetic research trends and theories focus on topics such as speech motor control, memory for speech, the interaction of speech perception and production, and their roles in language change.

14.What does the phenomenon of assimilation refer to?

The phenomenon of assimilation refers to when adjacent sounds come to share some phonetic properties.

15.What is the term used for acting as if abstract things are concrete?

The term used for acting as if abstract things are concrete is reification.

16.What does controlling articulatory movements involve?

Controlling articulatory movements involves the coordination and activation of various muscles in the chest, abdomen, larynx, tongue, throat, and face to produce specific speech sounds.

17.How does memory for speech contribute to the variability of speech production?

Memory for speech accounts for the variability in speech production among different speakers due to their vocal tract physiology, speech motor coordination, and exposure to different speech styles.

18.According to the exemplar theory, how are words stored in memory?

According to the exemplar theory, words are stored in speech memory in their most basic phonetic form and their phonetic variability is memorized rather than computed.

19.What is the role of the balance between phonetic forces in explaining sound patterns?

The balance between phonetic forces explains how speakers and listeners strive to use language sounds with maximum ease of articulation while maintaining sufficient perceptual contrast between sounds for effective communication.

20.How does the principle of 'maximum perceptual separation' affect sound patterns?

The principle of 'maximum perceptual separation' influences the set of sounds that potentially can occur at a given position in a word, ensuring that there is enough perceptual contrast to distinguish meaningful units.

21.How many values does the feature [bilabial] indicate?

The feature [bilabial] indicates that the segment is produced with lips and involves both of them.

22.What are the major divisions in the phonetic implementation approach?

The major divisions in the phonetic implementation approach include language universal features, speaking styles, generalization and productivity, and sound change.

23.What is the effect of co-articulation on pronunciation?

Co-articulation results in changes in pronunciation, such as the change in the place of the nasal and the following stop in words like "improper" and "impossible."

24.How are changes in pronunciation influenced by the balance between phonetic forces?

Changes in pronunciation are influenced by the tendency to use language sounds with maximum ease of articulation, leading to assimilation and reduction of certain segments.

25.What are the postulates of the exemplar theory?

The postulates of the exemplar theory include language universal features, speaking styles, generalization and productivity, and sound change.

26.What is the purpose of feature hierarchy in phonetics and phonology?

The purpose of feature hierarchy is to classify speech sounds and describe them formally based on their supra-laryngeal and laryngeal characteristics, place and manner of articulation, nasality, laterality, and other specific phonetic properties.

27.How are speech sounds divided in terms of feature hierarchy?

Speech sounds are divided based on major regions of the vocal tract, such as Labial, Coronal, Dorsal, Radical, and Glottal, which further subdivide into more specific subregions based on their features.

28.What is the feature hierarchy's reflection of the four major features?

The feature hierarchy reflects the four major features (Stop, Fricative, Approximant, and Vowel) that depend on the degree of closure of the articulators.

29.What are the problems with linguistic explanations in phonetics?

Linguistic explanations in phonetics may not always satisfy all aspects of speech production, as they focus on descriptions of sound patterns rather than providing

comprehensive explanations for individual variation, speech motor control, and the interaction of speech perception and production.

30.What is the alternative approach to linguistic explanations for understanding language sound patterns?

The alternative approach is to consider the phonetics of the individual, which takes into account factors such as speech motor control, memory for speech, and the balance between phonetic forces to provide a more comprehensive understanding of language sound patterns.

CODE: ENG507

OBJECTIVE PART

LESSON 35,36

1.What are the two topics discussed in this section?

- A. Phonotactics and syllabification
- B. Phonetics and phonology
- C. Consonant clusters and vowel patterns
- D. Phonemes and morphological structure

2.What is the universal pattern of syllable found in all languages?

- A. CV pattern
- B. CVC pattern
- C. CCV pattern
- D. CCCV pattern

3.What is resyllabification?

- A. The division of a word into syllables
- B. The alteration of syllable boundaries
- C. The reanalysis of phonemes in a word

D. The creation of new syllabic templates

4. Which term refers to a word containing a single syllable?

A. Monosyllabic

B. Polysyllabic

C. Syllabification

D. Phonotactics

5. What are consonant sequences called in syllable structure?

A. Clusters

B. Onsets

C. Codas

D. Peaks

6. What is phonotactics?

A. The study of syllable structures

B. The division of a word into phonemes

C. The study of sound sequences in a language

D. The analysis of speech using Praat software

7. What is the purpose of syllabification?

A. To identify syllable boundaries in writing

B. To analyze phonotactic patterns in a language

C. To determine the order of phonemes in a syllable

D. To separate words into individual sound units

8. Which software is commonly used for research in phonetics and phonology?

A. Praat

B. WaveSurfer

C. Phonotactics

D. Phonotactics

9. Who created Praat software?

A. Paul Boersma and David Weenink

B. Sonya Bird and Qian Wang

C. Institute of Phonetics Sciences

D. University of Amsterdam

10. What can you do with Praat software?

A. Analyze, synthesize, and manipulate speech

B. Create high-quality pictures for articles and thesis

C. Explore basic features of acoustic analysis

D. All of the above

11. What is the purpose of segmenting and labeling in Praat?

A. To create boundaries and annotate a sound file

B. To analyze and synthesize from the tools panel

C. To extract portions of a sound file for analysis

D. To export visual displays to a Word document

12. How can you export visual displays from Praat to a Word document?

A. Use the Export button in Praat software

B. Maximize the Edit window and press Print Screen

C. Copy and paste the image into Word document

D. Save the image file and import it into Word

13. What does the term "CV" represent in phonotactics?

A. Consonant-Vowel pattern

- B. Clipped Voice
- C. Complex Vowel
- D. Central Vibration

14.What is the term for a word with four phoneme pattern?

- A. CCVC
- B. CVCC
- C. CVCV
- D. CCCV

15.What is the purpose of the TextGrid in Praat?

- A. To analyze waveform and spectrogram
- B. To segment and label intervals in a sound file
- C. To create syllabic divisions in a word
- D. To display visual representations of speech

16.hich source provides an introductory tutorial for Praat software?

- A. University of Victoria Canada
- B. yahoopraatgroup
- C. Praat homepage
- D. Acoustic Phonetics Lab Manual

17.What is the primary function of Praat software?

- A. To analyze acoustic phonetics
- B. To create high-quality pictures
- C. To synthesize speech sounds
- D. To study phonological patterns

18.What is the purpose of the "Record" function in Praat?

- A. To display recorded sound files
- B. To manipulate recorded speech
- C. To analyze recorded waveform
- D. To create a new sound file

19. Which tier is used for segmental symbols and text annotations in Praat?

- A. Word segment
- B. Phoneme tier
- C. Spectrogram tier
- D. TextGrid tier

20. How can you remove a boundary in Praat's TextGrid?

- A. Highlight the boundary and press Remove
- B. Double-click on the boundary
- C. Right-click on the boundary and select Delete
- D. Press Alt+Backspace while the boundary is selected

21. What should you be cautious of when recording sound in Praat?

- A. Volume bar fluctuations
- B. Clipping of the signal
- C. Sampling rate selection
- D. All of the above

22. What is the recommended sampling rate for recording sound in Praat?

- A. 44100 Hz
- B. 22050 Hz
- C. 8000 Hz
- D. 48000 Hz

23.What is the purpose of the Edit window in Praat?

- A. To display recorded sound files
- B. To edit and manipulate sound files
- C. To visualize waveform and spectrogram
- D. To export visual displays to Word

24.How can you open a sound file and TextGrid together in Praat?

- A. Highlight both files and click Edit
- B. Drag and drop the files into Praat
- C. Right-click on the files and select Open
- D. Press Ctrl and click on each file to highlight them

25.How can you label intervals in Praat's TextGrid?

- A. Double-click on the interval
- B. Select the interval and press Label
- C. Highlight the interval and type in the Textbox
- D. Right-click on the interval and choose Label

26.What should you do to avoid a "clipped" signal in Praat?

- A. Adjust the recording volume
- B. Increase the sampling rate
- C. Use a different sound file format
- D. Select a higher bit depth for recording

27.What is the purpose of extracting a selection in Praat?

- A. To remove unwanted portions from a sound file
- B. To analyze the selected portion separately
- C. To save the selection as a separate sound file

D. To adjust the boundaries of the selection

28. How can you export labeled waveform and spectrogram to Word in Praat?

A. Use the Export button in Praat software

B. Save the waveform and spectrogram as image files

C. Use the Copy function in Praat and paste into Word

D. Print the waveform and spectrogram directly from Praat

29. What is the purpose of the "PrtSc" (Print Screen) button in Praat?

A. To take screenshots of Praat windows

B. To adjust the volume during recording

C. To export sound files to a printable format

D. To maximize the Edit window in Praat

30. Where can you find an introduction to Praat software?

A. University of Victoria Canada

B. yahoopraatgroup

C. Praat homepage

D. Acoustic Phonetics Lab Manual

CODE: ENG507

SUBJECTIVE PART

LESSON 35,36

Syllabic Templates and Syllabification

Phonotactics

1. What is a syllable?

A syllable is a unit of pronunciation that is typically larger than a single sound and smaller than a word.

2. How can a word be divided into syllables?

A word can be divided into syllables based on its syllabic divisions, which are indicated in writing and provide information on how a word can be hyphenated.

3.What is syllabification?

Syllabification refers to the division of a word into syllables.

4.What is resyllabification?

Resyllabification refers to a reanalysis that changes the location of syllable boundaries in a word.

5.What is the CV pattern of a syllable?

The CV pattern refers to a syllable structure where a consonant is found at the onset followed by a vowel as its peak.

5.Is the CV pattern universal in languages?

Yes, the CV pattern is found in all languages of the world and is considered the universal pattern of syllables.

6.Are there languages that only allow CV templates of syllables?

Yes, there are languages that only allow CV templates of syllables, such as Honolulu (CVCVCVCV) and Waikiki (CVCVCV).

7.What is the term for a word containing a single syllable?

A word containing a single syllable is called a monosyllabic word.

8.What is the term for a word containing more than one syllable?

A word containing more than one syllable is called a polysyllabic word.

9.How do languages differ from each other in terms of syllable structure?

Languages differ in terms of syllable structure due to their different syllabic patterns and templates.

10.What are consonant sequences called?

Consonant sequences are called clusters, which can consist of two consonants (CC) or three consonants (CCC).

11.What are the three types of syllabic patterns based on consonant clusters?

The three types of syllabic patterns based on consonant clusters are simple, moderate, and complex.

12.What is phonotactics?

Phonotactics is the study of the phonemes and their order found in the syllables of a language, focusing on sound sequences.

13.Do languages allow all phonemes to appear in any order?

No, languages do not allow all phonemes to appear in any order. There are restrictions and constraints on the possible combinations of phonemes in a language.

14.Give an example of a phonotactic constraint in English.

In English, certain consonant sequences like /fs/ and /spm/ do not occur initially in words.

15.What are some examples of English phonotactic patterns?

Some examples of English phonotactic patterns include one phoneme pattern (V), two phoneme pattern (CV), three phoneme pattern (CVC), and so on, up to seven phoneme patterns (CCCVCCC).

16.What is Praat?

Praat is a computer program used for speech analysis, synthesis, and manipulation. It is widely used in phonetics and phonology research.

17.Who created Praat?

Praat was created by Paul Boersma and David Weenink at the Institute of Phonetics Sciences of the University of Amsterdam.

18.Where can Praat be downloaded from?

Praat can be downloaded from the official website: <http://www.praat.org> or <http://www.fon.hum.uva.nl/praat/>.

19.What is the purpose of the Praat software?

Praat allows users to analyze, synthesize, and manipulate speech, as well as create high-quality pictures for articles and theses.

20.Is there a Praat manual available?

Yes, there is a Praat manual available, developed by the faculty at the University of Victoria, Canada.

21.What can be done with Praat's basic features?

With Praat's basic features, users can explore the software and perform tasks such as making recordings, displaying waveforms and spectrograms, segmenting and labeling components, and exporting visual displays.

22.What is the first step in recording a new sound in Praat?

The first step is to go to "NEW > RECORD mono-sound" and select the desired sampling rate.

23.How can clipping in a recording be avoided?

To avoid clipping, it is important to ensure that the recording level is not too high, indicated by the volume bar staying within the acceptable range.

24.What is segmenting and labeling in Praat?

Segmenting and labeling refers to the process of placing segmental symbols and annotating a sound file, which is helpful for acoustic analysis and adding phonetic symbols.

25.How can visual displays be exported to a Word document in Praat?

The visual displays can be exported to a Word document by maximizing the edit window, pressing the "PrtScr" (Print Screen) button on the keyboard, and pasting the captured image into the Word document.

26.What is the purpose of segmenting and labeling in Praat?

Segmenting and labeling in Praat allows for the placement of segmental symbols, text annotation, and the creation of textgrids for further analysis and measurement.

27.What is the benefit of exporting visual displays to a Word document in Praat?

Exporting visual displays to a Word document allows for documentation and reporting of experiments, ensuring a record of measurements and analysis.

28.What is the importance of Praat in the study of phonetics and phonology?

Praat plays a significant role in the study of phonetics and phonology, specifically in the field of acoustic analysis of speech. It provides tools for analyzing speech sounds, conducting experiments, and facilitating research in the area of phonetics and phonology.

CODE: ENG507

OBJECTIVE PART

LESSON 37,38

1.Which of the following topics is covered in this lesson?

- a) Vowel recording techniques
- b) Spectral slice analysis
- c) Plotting vowels on a chart
- d) Acoustic Phonetics Lab Manual development

2.How many vowels from American English are recommended to be recorded in this lesson?

- a) Four
- b) Six

c) Eight

d) Ten

3.What are the three things that students need to measure after recording the vowels?

a) Intrinsic pitch, formant values, and duration

b) Spectral make-up, formant tracking, and articulation

c) Intrinsic pitch, spectral make-up, and formant values

d) Pitch, duration, and articulation

4.How can students confirm their pitch (F0) measurement for each vowel?

a) Use formant tracking

b) View the waveform

c) Look at the spectral slice

d) Measure the duration

5.What are the two formants (F1 and F2) that need to be measured for each vowel?

a) F1 and F0

b) F2 and F3

c) F1 and F3

d) F1 and F2

6.Which method is suggested for measuring the first and second formants?

a) Automatic formant tracking

b) Manual measurement

c) Spectrogram analysis

d) Waveform inspection

7.Why do formants (F1 and F2) differ across vowels?

a) They correspond to different articulations.

b) They are influenced by speaker age.

c) They are not affected by vowel type.

d) They are determined by F0 values.

8.What does F1 seem to correspond to, in terms of articulation?

a) Vowel height

b) Vowel frontness

c) Vowel duration

d) Vowel pitch

9.How should F1 and F2 values be plotted on the chart?

a) F1 on the X-axis and F2 on the Y-axis

b) F1 on the Y-axis and F2 on the X-axis

c) Both F1 and F2 on the X-axis

d) Both F1 and F2 on the Y-axis

10.Which software is recommended for plotting the formant values on a chart?

a) Praat

b) Microsoft Word

c) Excel spreadsheet

d) Adobe Photoshop

11.What should be measured to explore the acoustics of vowels in this session?

a) Consonant properties

b) Pitch and loudness

c) Spectral make-up and formant values

d) Articulation speed

12. What is the topic of Chapter 3 in the Acoustic Phonetics Lab Manual?

- a) Spectral Slice Analysis
- b) Vowel Properties
- c) Formant Tracking Techniques
- d) Vowel Recording Procedures

13. How many ways are mentioned to measure pitch (F0) for each vowel?

- a) One
- b) Two
- c) Three
- d) Four

14. Which of the following is NOT one of the eight vowels to be recorded from American English?

- a) Hood
- b) Hed
- c) Had
- d) Who'd

15. How can students confirm their pitch measurement if their values seem strange?

- a) Record the vowels again using a different microphone.
- b) Use another vowel for comparison.
- c) Use another measurement method for confirmation.
- d) Increase the recording volume.

16. What is the main purpose of recording the eight vowels from American English?

- a) To explore the acoustics of consonants.

- b) To analyze their duration and loudness.
- c) To measure the fundamental frequency (F0).
- d) To learn about articulation types.

17. How should students label the y-axis when plotting the pitch measurements on the Excel sheet?

- a) Vowel sounds
- b) Articulation types
- c) Duration of vowels
- d) A scale that allows spreading out measurements

18. Which feature of vowels can be analyzed through the spectral slice?

- a) Pitch
- b) Duration
- c) Amplitude
- d) Formant values

19. What is the final step in analyzing the spectral make-up of vowel sounds?

- a) Recording the vowels in the Edit window
- b) Using Praat's automatic formant tracking
- c) Plotting formant values on an Excel chart
- d) Exporting the chart to Microsoft Word

20. What does F2 seem to correspond to, in terms of articulation?

- a) Vowel height
- b) Vowel frontness
- c) Vowel duration
- d) Vowel pitch

21. Which formant is equivalent to the fundamental frequency (F0)?

- a) F0
- b) F1
- c) F2
- d) H1

22. Which of the following is NOT a property that students need to measure for the vowels?

- a) Intrinsic pitch
- b) Spectral make-up
- c) Duration of vowels
- d) Articulation type

23. How many vowels from American English are recommended to be recorded in this lesson?

- a) Four
- b) Six
- c) Eight
- d) Ten

24. Which method is suggested for measuring the first and second formants?

- a) Automatic formant tracking
- b) Manual measurement
- c) Spectrogram analysis
- d) Waveform inspection

25. What should students measure to explore the acoustics of vowels?

- a) Consonant properties
- b) Vowel duration and loudness

c) Spectral make-up and formant values

d) Articulation speed

26. How can students confirm their pitch measurement if their values seem strange?

a) Record the vowels again using a different microphone.

b) Use another vowel for comparison.

c) Use another measurement method for confirmation.

d) Increase the recording volume.

27. What is the main purpose of recording the eight vowels from American English?

a) To explore the acoustics of consonants.

b) To analyze their duration and loudness.

c) To measure the fundamental frequency (F0).

d) To learn about articulation types.

28. How should students label the y-axis when plotting the pitch measurements on the Excel sheet?

a) Vowel sounds

b) Articulation types

c) Duration of vowels

d) A scale that allows spreading out measurements

29. Which feature of vowels can be analyzed through the spectral slice?

a) Pitch

b) Duration

c) Amplitude

d) Formant values

30. What does F2 seem to correspond to, in terms of articulation?

a) Vowel height

b) Vowel frontness

c) Vowel duration

d) Vowel pitch

CODE: ENG507

SUBJECTIVE PART

LESSON 37,38

1. What are the learning objectives at the end of this section?

Answer: The learning objectives are to explain vowel properties and recognize and analyze features such as intrinsic pitch and spectral make-up (formant values).

2. Which eight vowels from American English are to be recorded for exploration in this session?

Answer: The eight vowels are "heed, hid, head, had, hod, hawed, hood, and who'd."

3. What are the three things to measure after recording the vowels?

Answer: The three things to measure are intrinsic pitch, spectral make-up (formants), and plotting them in an Excel sheet.

4. How can you confirm the pitch measurement for each vowel?

Answer: You can confirm the pitch measurement by looking at the spectral slice and selecting the first peak (H1) which corresponds to F0 (pitch).

5.How can you plot the pitch of each vowel in Excel?

Answer: Plot the pitch of each vowel on the Excel sheet and label the y-axis with a scale that allows you to spread out your measurements as much as you can.

6.What are the two formants needed for the spectral make-up of vowels?

Answer: The first two formants needed are F1 and F2.

7.How can you calculate the first two formants (F1 and F2) for each vowel?

Answer: You can calculate the first two formants using either automatic formant tracking or manual measurement in Praat.

8.What kind of spectrogram do you need for measuring F1 and F2?

Answer: You need the default wide-band spectrogram for measuring F1 and F2 of each vowel.

9.What are the questions related to formants (F1 and F2) that you need to answer?

Answer: The questions are:

- a. Why do formants (F1 and F2) differ across vowels?
- b. What does F1 seem to correspond to, in terms of articulation?
- c. What about F2? To what does it correspond?

10.How should you arrange the formant values in Excel for plotting vowels on a chart?

Answer: Put the formant values for different vowels in separate columns, with vowels in the first column, the difference between F2 and F1 in the second column, and F1 in the third column.

11. How do you make the chart correspond with the required values for F1 and F2?

Answer: Reverse the values for both F1 and F2 on both axes (Y and X), with zero for both at the right corner.

12. What does the height of the vowel correspond to in the chart?

Answer: The height of the vowel in the chart corresponds inversely to F1.

13. What does the difference between F2 and F1 correspond to in the chart?

Answer: The difference between F2 and F1 in the chart corresponds to the frontness of the vowels.

14. What is the recommended reading material for further information on this section?

Answer: Chapter 3 (Lab 3) of Acoustic Phonetics Lab Manual developed by Sonya Bird and Qian Wang at the University of Victoria.

CODE: ENG507

OBJECTIVE PART

LESSON 39,40

1. Which sounds are referred to as sonorants in the paragraph?

- a) Stops and fricatives
- b) Vowels and nasals
- c) Nasals and glides

d) Fricatives and liquids

2. Why are sonorants called sonorants?

a) Because they have formants

b) Because they behave like consonants

c) Because they have higher amplitude

d) Because they are vowel-like sounds

3. How do sonorants differ from vowels?

a) They have lower amplitude

b) They have higher amplitude

c) They have no formants

d) They behave like stops

4. What is the purpose of recording sequences like /ama/ and /ana/?

a) To compare them with vowels

b) To explore formant transitions

c) To investigate nasals' formants

d) To experiment with sonorant sounds

5. What are the distinctive features of nasals in acoustic analysis?

a) High amplitude and formant transition

b) Low amplitude and anti-formants

c) Low amplitude and formant transition

d) High amplitude and anti-formants

6. How many formants are measured for nasals in the analysis?

a) One (F1)

b) Two (F1 and F2)

c) Three (F1, F2, and F3)

d) Four (F1, F2, F3, and F4)

7. Is there one formant with a similar frequency for all places of articulation in nasals?

a) Yes

b) No

8. Among nasals and [a], what differences are observed?

a) They have different amplitude patterns

b) They have different formant structures

c) Nasals have formants, but [a] doesn't

d) Nasals have anti-formants, but [a] doesn't

9. Which sounds are considered as glides in the paragraph?

a) Stops and fricatives

b) Vowels and nasals

c) Nasals and glides

d) Fricatives and liquids

10. How are glides similar to sonorants?

a) They have low amplitude

b) They have high amplitude

c) They have formants

d) They have anti-formants

11. What is one of the steps to calculate VOT (Voice Onset Time)?

a) Measure the duration of the following vowel

b) Measure the duration of the preceding vowel

c) Measure the duration of the stop closure

d) Measure the duration of the release burst

12.What are the three important acoustic correlates of voicing in stops?

a) Formants, duration, and transitions

b) VOT, amplitude, and voicing

c) Voice bar, VOT, and duration of the preceding vowel

d) Frequency, voice bar, and amplitude

13.Which characteristic distinguishes voiced, voiceless, and aspirates stop sounds?

a) Formants

b) Amplitude

c) Voice Onset Time (VOT)

d) Voicing

14.What is VOT?

a) The duration of the preceding vowel

b) The duration of the release burst

c) The duration of the following vowel

d) The duration of the stop closure

15.How does VOT differ in voiced and voiceless stops?

a) Voiced stops have a longer VOT

b) Voiced stops have a shorter VOT

c) Voiced stops have a negative VOT

d) Voiced stops have a positive VOT

16.Which aspect of the glides is explored by analyzing the formant structure?

- a) Duration
- b) VOT
- c) Transitions
- d) Articulation

17.What does VOT stand for?

- a) Voice Over Time
- b) Voice On Time
- c) Voice Over Transition
- d) Voice Onset Time

18.What distinguishes sonorants from vowels?

- a) Formants
- b) Duration
- c) Amplitude
- d) Voicing

19.What is a distinctive feature of nasals in acoustic analysis?

- a) Formant transition
- b) Anti-formants
- c) Voicing
- d) Vowel-like sounds

20.How are sonorants different from vowels?

- a) They have higher amplitude
- b) They have lower amplitude
- c) They have no formants
- d) They behave like consonants

21. How many formants are typically measured for nasals in acoustic analysis?

- a) One (F1)
- b) Two (F1 and F2)
- c) Three (F1, F2, and F3)
- d) Four (F1, F2, F3, and F4)

22. What do nasals have in terms of formants that differ from vowels?

- a) Higher amplitude
- b) Formant transitions
- c) Anti-formants
- d) Lower frequency

23. Which sounds are considered as sonorants?

- a) Stops and fricatives
- b) Vowels and nasals
- c) Nasals and glides
- d) Fricatives and liquids

24. What is the purpose of recording sequences like /ama/ and /ana/?

- a) To compare them with vowels
- b) To experiment with sonorant sounds
- c) To investigate nasals' formants
- d) To explore formant transitions

25. What is one of the steps to calculate VOT (Voice Onset Time)?

- a) Measure the duration of the following vowel
- b) Measure the duration of the preceding vowel
- c) Measure the duration of the stop closure

d) Measure the duration of the release burst

26. How are glides similar to sonorants?

- a) They have low amplitude
- b) They have high amplitude
- c) They have formants
- d) They have anti-formants

27. What is one of the three important acoustic correlates of voicing in stops?

- a) Formants
- b) Duration
- c) Voice Onset Time (VOT)
- d) Voicing

28. What is VOT?

- a) The duration of the preceding vowel
- b) The duration of the release burst
- c) The duration of the following vowel
- d) The duration of the stop closure

29. How does VOT differ in voiced and voiceless stops?

- a) Voiced stops have a longer VOT
- b) Voiced stops have a shorter VOT
- c) Voiced stops have a negative VOT
- d) Voiced stops have a positive VOT

30. What does VOT stand for?

- a) Voice Over Time
- b) Voice On Time

c) Voice Over Transition

d) Voice Onset Time

CODE: ENG507

SUBJECTIVE PART

LESSON 39,40

Topic-195: Sonorants and Their Formants

1.What are sonorants, and why are they called sonorants?

Answer: Sonorants are vowel-like sounds (nasals and glides) that have formants, which are their acoustic correlates.

2.How do sonorants differ from vowels?

Answer: Sonorants generally have lower amplitude, making them behave more like consonants.

3.What sequences of sounds should be recorded for experimentation on sonorant sounds?

Answer: The sequences to be recorded are /ama/ - /ana/ - /aŋa/ - /wi/ - /ju/.

4.What aspects of sonorant sounds should be explored in the analysis?

Answer: The measurement of F1, F2, F3, and a comparison with vowels.

5.What are the students expected to do before moving to the next topic?

Answer: They should try to answer the questions related to sonorant sounds' features.

Topic-196: Nasal Formants

6. Why are formants for nasal sounds important for acoustic analysis?

Answer: Nasals have distinctive waveforms due to their unique forms of anti-formants and formant transition.

7. What are the three formants that need to be measured for nasals?

Answer: F1, F2, and F3 formants.

8. Are there any systematic patterns across nasals in terms of their formants?

Answer: Yes, there are systematic patterns in nasals based on their formants.

9. Is there one formant with a similar frequency for all places of articulation in nasals?

Answer: Yes, there is one formant that has a similar frequency for all places of articulation in nasals.

10. Do nasals show overall differences when compared to the vowel [a]?

Answer: Yes, nasals show overall differences compared to the vowel [a] in terms of their formants.

Topic-197: Glide and Their Formants

11. What are glides, and why are they classified as sonorants?

Answer: Glides are vowel-like sounds with formants, similar to nasals, which is why they are classified as sonorants.

12.What formants need to be taken for glides' acoustic analysis?

Answer: The first three formants (F1, F2, and F3) from the middle of the glide sounds.

13.How should the formants of glides be compared with vowels?

Answer: Draw lines to indicate F1, F2, and F3 and then compare them with vowels.

14.Which vowel does each glide resemble?

Answer: The specific vowels that each glide resembles should be identified.

15.What differences can be observed between the contours of the two glides, /w/ and /j/?

Answer: The differences between the transitions out of the two glides should be analyzed.

16.What might cause the differences in glide contours in terms of articulation?

Answer: The possible causes of differences in glide contours related to articulation should be considered.

Topic-198: Stop Voicing on Spectrograph

17.What are the three important acoustic correlates of voicing in stops?

Answer: The voice bar, voice onset time (VOT), and the duration of the preceding vowel.

18. Which sounds should be recorded to analyze stop voicing on the spectrograph?

Answer: The sounds to be recorded are /apa/, /aba/, /ata/, /ada/, /apha/, and /atha/.

19. How can the voicing or voice bar be observed in stops?

Answer: The features of stops should be explored to observe the presence of voicing or the voice bar.

20. Are there any features related to the place of articulation in stops?

Answer: Yes, features related to the place of articulation can be compared between bilabial and non-bilabial stops.

Topic-199: Measuring Voice Onset Time (VOT)

21. What is the characteristic feature of stops related to VOT?

Answer: Voice Onset Time (VOT) is the characteristic feature of stops related to voiced, voiceless, and aspirates sounds.

22. What sounds should be recorded to measure VOT?

Answer: The sounds to be recorded are /apa/, /aba/, /ata/, /ada/, /apha/, and /atha/.

23. How can VOT be calculated for each stop?

Answer: VOT can be calculated by measuring the time between the end of the stop closure and the onset of voicing in the following vowel.

24. How does VOT differ in voiced and voiceless stops, and why?

Answer: VOT is longer in voiceless stops compared to voiced stops, which is related to the timing of voicing onset.

25. How does the duration of the preceding vowel differ depending on the voicing of the following consonant?

Answer: The duration of the preceding vowel tends to be longer in voiceless stops compared to voiced stops.

CODE: ENG507

OBJECTIVE PART

LESSON 41,42

1. Which area of research in P&P can address the difficulties faced by Pakistani learners of English?

- A) Experimental Phonetics
- B) The Study of Variety
- C) Distinctive Features
- D) Phonetics and Phonology in Applied Linguistics

2. Which of the following is not mentioned as a problematic area for Pakistani learners of English?

- A) Stress placement
- B) Intonation patterns
- C) Syllabification and resyllabification of English words
- D) Vocabulary acquisition

3.What type of analysis can researchers carry out between English phonology and the sound systems of regional languages of Pakistan?

A) Comparative analysis

B) Contrastive analysis

C) Similarity analysis

D) Descriptive analysis

4.What aspect of phonological analysis involves describing a phoneme as a combination of different features?

A) Feature analysis

B) Contrastive analysis

C) Phonemic analysis

D) Descriptive analysis

5.Which area of research focuses on brain functions in speech production and processing?

A) Distinctive Features

B) Experimental Phonetics

C) The Study of Variety

D) Current Trends in P&P Research

6.What does ELT stand for in the context of P&P research?

A) Experimental Language Teaching

B) English Linguistic Theory

C) English Language Teaching

D) Essential Language Training

7.How can teachers sensitize their students regarding the topic of phonological contrastive analysis?

A) Encourage students to learn multiple regional languages

B) Use self-initiated procedures for research

C) Organize workshops on phonetics and phonology

D) Promote cultural diversity in the classroom

8.What is one method for teaching pronunciation that involves using dictionaries and transcription of audio-based activities?

A) Task-Based Learning and Teaching

B) Classroom Research for ELT

C) Developing Relevant Material

D) The Study of Variety

9.Classroom (action) research is based on:

A) Theoretical concepts

B) Problem-solving and research by teachers

C) Large-scale surveys

D) External funding from international organizations

10.What aspect of ELT is considered a golden method for second language acquisition?

A) Task Based Learning and Teaching (TBLT)

B) Phonetics and Phonology Research

C) Experimental Phonetics

D) Classroom Research for ELT

11.What is the focus of material development for teaching pronunciation?

A) Encouraging cultural diversity

B) Enhancing the proficiency level of students

C) Promoting specific dialects of English

D) Using complex linguistic theories

12. How can teachers keep themselves updated about the latest research and teaching methodologies?

A) Reading teachers' digests and journals

B) Conducting classroom research

C) Exploring material from primary schools

D) Focusing solely on phonetic studies

13. What type of research is considered the most rewarding and productive for teachers' professional development?

A) Phonetics and Phonology specific research

B) Descriptive linguistic research

C) Classroom research for ELT

D) Comparative phonetic analysis

14. In which region is there potential for research in areal and typological linguistics due to its rich linguistic diversity?

A) The Americas

B) Europe

C) Himalaya Hindu Kush (HKH) region

D) Sub-Saharan Africa

15. Which organization can provide funding for research on endangered languages in Pakistan?

A) United Nations Educational, Scientific and Cultural Organization (UNESCO)

B) International Phonetic Association (IPA)

C) Organization for Linguistic Diversity (OLD)

D) Himalaya Hindu Kush (HKH) Foundation

16.Which aspect of phonological analysis involves describing a phoneme as a combination of different features?

- A) Feature analysis
- B) Contrastive analysis
- C) Phonemic analysis
- D) Descriptive analysis

17.What are the three principles for feature analysis mentioned in the paragraph?

- A) Descriptive function, historical function, comparative function
- B) Contrastive function, descriptive function, classificatory function
- C) Historical function, classificatory function, practical function
- D) Phonemic function, historical function, practical function

18.Which area of research focuses on the study of the varieties of English and other major languages such as Urdu, Punjabi, and Pashto?

- A) Distinctive Features
- B) Experimental Phonetics
- C) The Study of Variety
- D) Current Trends in P&P Research

19.Which aspect of ELT involves focusing on the issues faced by ELT instructors and seeking solutions through research?

- A) Facilitating Action Research
- B) Developing Relevant Material
- C) The Relationship Between ELT and P&P
- D) Conducting Classroom Research for ELT

20.What is the purpose of action research in the context of ELT?

- A) To explore theoretical concepts in linguistics
- B) To identify potential research topics for students
- C) To facilitate research on regional languages
- D) To focus on problem-solving related to teaching

21.What does IPA stand for in the context of P&P research?

- A) International Phonetic Association
- B) In-Depth Phonetics Analysis
- C) Interactive Phonological Analysis
- D) International Phonetics Archive

22.What is the focus of material development for teaching pronunciation?

- A) Encouraging cultural diversity
- B) Enhancing the proficiency level of students
- C) Promoting specific dialects of English
- D) Using complex linguistic theories

23.What is one method for teaching pronunciation that involves using dictionaries and transcription of audio-based activities?

- A) Task-Based Learning and Teaching
- B) Classroom Research for ELT
- C) Developing Relevant Material
- D) The Study of Variety

24.How can teachers keep themselves updated about the latest research and teaching methodologies?

- A) Reading teachers' digests and journals
- B) Conducting classroom research
- C) Exploring material from primary schools

D) Focusing solely on phonetic studies

25. What type of research is considered the most rewarding and productive for teachers' professional development?

A) Phonetics and Phonology specific research

B) Descriptive linguistic research

C) Classroom research for ELT

D) Comparative phonetic analysis

26. In which region is there potential for research in areal and typological linguistics due to its rich linguistic diversity?

A) The Americas

B) Europe

C) Himalaya Hindu Kush (HKH) region

D) Sub-Saharan Africa

27. Which organization can provide funding for research on endangered languages in Pakistan?

A) United Nations Educational, Scientific and Cultural Organization (UNESCO)

B) International Phonetic Association (IPA)

C) Organization for Linguistic Diversity (OLD)

D) Himalaya Hindu Kush (HKH) Foundation

28. Which area of research focuses on the study of the varieties of English and other major languages such as Urdu, Punjabi, and Pashto?

A) Distinctive Features

B) Experimental Phonetics

C) The Study of Variety

D) Current Trends in P&P Research

29.Which aspect of ELT involves focusing on the issues faced by ELT instructors and seeking solutions through research?

- A) Facilitating Action Research
- B) Developing Relevant Material
- C) The Relationship Between ELT and P&P
- D) Conducting Classroom Research for ELT

30.What is the purpose of action research in the context of ELT?

- A) To explore theoretical concepts in linguistics
- B) To identify potential research topics for students
- C) To facilitate research on regional languages
- D) To focus on problem-solving related to teaching

CODE: ENG507

SUBJECTIVE PART

LESSON 41,42

Question1: What are some potential areas for research in Pakistani context within applied phonology?

Answer: Some potential areas for research in Pakistani context within applied phonology include studying issues faced by Pakistani learners of English, pronunciation issues of Pakistani learners, and exploring and documenting the features of Pakistani English based on their phonological features.

Question2: What are some other problematic areas that researchers can explore in phonology?

Answer: Other problematic areas that researchers can explore in phonology include segmental and supra-segmental features like stress placement, intonation patterns, and syllabification and resyllabification of English words by Pakistani learners.

Question3: What is one area of research that can be carried out by researchers in phonology?

Answer: Researchers can conduct contrastive analysis between English phonology and the sound systems of the regional languages of Pakistan (Urdu, Punjabi, Sindhi, Balochi, and Pashto).

Question4: What are some potential areas for research in P&P other than ELT?

Answer: Some potential areas for research in P&P other than ELT include studying regional languages of Pakistan, focusing on areal and typological linguistics, and exploring distinctive features in phonetic studies.

Question5: What does experimental phonetics involve?

Answer: Experimental phonetics involves using various latest experimental techniques and computer software in carefully designed lab experimentation to discover hidden aspects of human speech, such as speech production and processing.

Question6: How can teachers integrate phonetics and phonology in the teaching of ELT?

Answer: Teachers can integrate phonetics and phonology in the teaching of ELT by working on their pronunciation skills, conducting phonological contrastive analysis, participating in phonology-based ELT activities, and engaging in English Language Teaching Reforms (ELTR) projects.

Question7: What is the importance of developing relevant material for the teaching of phonetics and phonology?

Answer: Developing relevant material for the teaching of phonetics and phonology is important because it caters to the specific needs of ELT activities and enhances the proficiency level of students.

Question8: How can movies and documentaries be effective resources for the teaching of pronunciation?

Answer: Movies and documentaries can be effective resources for teaching pronunciation as they provide authentic examples of spoken language in different contexts and accents.

Question9: What is action research, and how can it be applied in ELT?

Answer: Action research involves focusing on issues faced by ELT instructors and seeking solutions through research. Teachers can conduct classroom-based action research to solve problems related to teaching and learning English.

Question10.: Why is it important for teachers to keep themselves updated with the latest research and teaching methodologies?

Answer: It is important for teachers to keep themselves updated with the latest research and teaching methodologies to stay informed about the best practices in ELT and enhance their teaching skills.

Question11: How can teachers facilitate action research in ELT?

Answer: Teachers can facilitate action research in ELT by encouraging and supporting their students and colleagues to conduct research on various aspects of language teaching and learning.

Question12: What areas of action research can be explored within phonetics and phonology?

Answer: Action research within phonetics and phonology can explore topics like phonological speech errors, learners' performance and development, reading/listening issues, and the impact of reading strategies on pronunciation.

Question13: How can teachers sensitize their students regarding phonological contrastive analysis?

Answer: Teachers can sensitize their students regarding phonological contrastive analysis by encouraging them to compare and contrast phonetic and phonological features between their mother tongues and English.

Question14: What is the significance of exploring distinctive features in phonetic studies?

Answer: Exploring distinctive features in phonetic studies helps in understanding the features of English pronunciation and sounds of other languages, thus contributing to the field of phonology.

Question15: What are some latest trends in experimental phonetics?

Answer: Some latest trends in experimental phonetics include studying brain functions in speech production and processing, neurolinguistics, and using advanced equipment such as x-ray techniques for analysis.

Question16: How can teachers access and make research more accessible to themselves and others?

Answer: Teachers can access research by reading teachers' digests, journals, and participating in online discussions through teaching associations, making research more accessible and facilitating their professional development.

Question17: What potential areas of research exist concerning English varieties in phonetics and phonology?

Answer: Potential areas of research concerning English varieties in phonetics and phonology include comparisons and contrasts among accents, phonetic and phonological levels, and studying segmental and suprasegmental features.

Question18: How can teachers integrate real-life material into phonetics and phonology teaching?

Answer: Teachers can integrate real-life material into phonetics and phonology teaching by incorporating audio from everyday language, movies, documentaries, and written interaction from real-life situations.

Question19: What are some potential research topics related to ELT and phonetics?

Answer: Some potential research topics related to ELT and phonetics include learners' reading strategies, classroom-based material development, and learners' pronunciation development.

Question20: How can teachers apply Task Based Learning and Teaching (TBLT) in the Pakistani context?

Answer: Teachers can apply Task Based Learning and Teaching (TBLT) in the Pakistani context by exploring its effectiveness in second language acquisition and adapting it to suit the needs of their students.

Question21: How can teachers encourage students to be part of platforms for ELT learning and discussion?

Answer: Teachers can encourage students to be part of platforms for ELT learning and discussion, such as TESOL Home Page and English Language Teaching Reforms (ELTR) projects, through social groups and online learning opportunities.

Question22: What is the significance of studying phonological speech errors in action research?

Answer: Studying phonological speech errors in action research can shed light on common pronunciation errors made by English language learners in Pakistan, thus providing insights for improvement.

Question23: How can teachers explore the phonetics and phonology of Pakistani regional languages in research?

Answer: Teachers can explore the phonetics and phonology of Pakistani regional languages in research by documenting and studying the sounds and accents used in these languages.

Question24: What is the role of phonological analysis in understanding phonemes and their features?

Answer: Phonological analysis involves describing phonemes as combinations of different features, which helps in understanding the pronunciation and characteristics of specific sounds.

Question25: How can teachers develop their own teaching material for pronunciation instruction?

Answer: Teachers can develop their own teaching material for pronunciation instruction by creating activities related to IPA transcriptions, involving students in listening exercises, and using real-life material like movies and documentaries.

Question26: How can teachers apply action research in their classrooms effectively?

Answer: Teachers can apply action research effectively by focusing on solving issues related to teaching and learning English, conducting research on these topics, and seeking solutions that can improve their practices.

Question27: How can teachers involve students in classroom-based research?

Answer: Teachers can involve students in classroom-based research by encouraging them to explore reading and listening issues, English reading strategies, and the impact of pronunciation on their language learning.

Question28: Why is the study of English dialectology significant for research in phonetics and phonology?

Answer: The study of English dialectology is significant for research in phonetics and phonology because it provides insights into geographic differences in the recognition of various forms of English.

Question29: What are some potential research topics within experimental phonetics and phonology?

Answer: Potential research topics within experimental phonetics and phonology include brain functions in speech production and processing, speech errors, and the impact of technology on speech analysis and synthesis.

Question30: How can teachers access online sources for research and professional development in ELT?

Answer: Teachers can access online sources for research and professional development in ELT by exploring websites like slideplayer.com, which offer valuable information and resources on various ELT topics.
