Questions :-

Disscuus briefly three laws of learning presented by Edward Thorndike?

Solution:-

Edward Thorndike, a prominent psychologist, proposed three laws of learning that are fundamental to understanding the process of learning. These laws are known as the laws of effect, readiness, and exercise. Let's briefly discuss each of these laws:

Law of Effect: The law of effect states that the consequences of an action determine the likelihood of that action being repeated in the future. Thorndike conducted experiments with animals in puzzle boxes and observed that behaviors leading to satisfying outcomes or rewards are more likely to be repeated, while behaviors leading to discomfort or punishment are less likely to be repeated. This law emphasizes the role of reinforcement and punishment in shaping behavior.

Law of Readiness: The law of readiness emphasizes the importance of an individual's readiness or preparedness to learn. According to this law, learning is most effective when the learner is mentally and physically ready to engage in the learning process. Thorndike believed that learners are more receptive to new information and skills when they have a level of motivation and preparedness to acquire the knowledge or perform the task at hand.

Law of Exercise: The law of exercise suggests that connections between a stimulus and response are strengthened through practice or repetition. Thorndike argued that the more frequently a stimulus and response occur together, the stronger the association becomes. This law highlights the significance of repetition and practice in reinforcing and consolidating learning.

Overall, these three laws of learning proposed by Edward Thorndike provide insights into the factors that influence learning and behavior. They emphasize the importance of consequences, readiness, and repetition in shaping and strengthening learning processes.
