

Sta, 630 important past paper questions

1. If u are researches and get the organization data 29 percentage from finances and other departments? Identification which type of sampling type us used here? **Q1 ans sunny bahi file**
2. Researches ask manager that is your staff members give full input and behave good with coworkers what problem with this question? **Q2 ans sunny bahi file**
3. A researcher observe the customer purchase behavior in shopping mall without intercing with them which type of observation? **Q3 ans sunny bahi file**

4. Different between population and target population? Q4 ans sunny bahi file

Ans:-

Q4: Difference b/w population and target population?

Ans: Population refers to the entire group of individuals or items that you're interested in studying or analyzing. Target population On the other hand, is a specific subset of population that you are focusing on or trying to draw conclusions about it. Target population is often defined based on certain characteristics or criteria that is relevant to your research analysis.

5. Explain three important parts of experiment? Q5 ans sunny bahi file

Ans:-

Q5: Name: Explain three Important parts of Experiment.

Ans: (i) Hypothesis. (ii) Variables (iii) Experimental design.

(i) Hypothesis: This is a testable prediction. It provides us a clear focus on what we're trying to investigate.

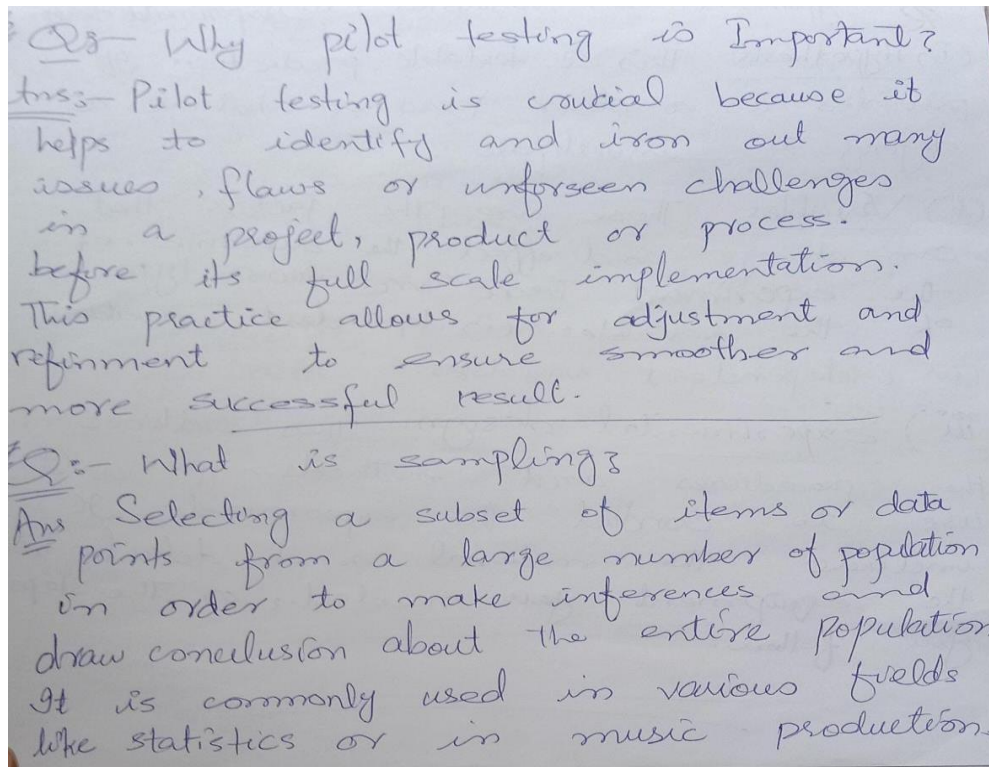

(ii) Variables: These are the factors that can change and affect the outcome of the experiment. There are two types of the variables. (i) dependent variables (ii) independent variables.

(iii) Experimental design: This outlines the procedures and methods you will use to conduct the experiment. It includes the material and details like the equipment you needed, or the steps you follow.

6. Why pilot testing is important? Q6 ans sunny bahi file

7. What is sampling? Q7 ans sunny bahi file

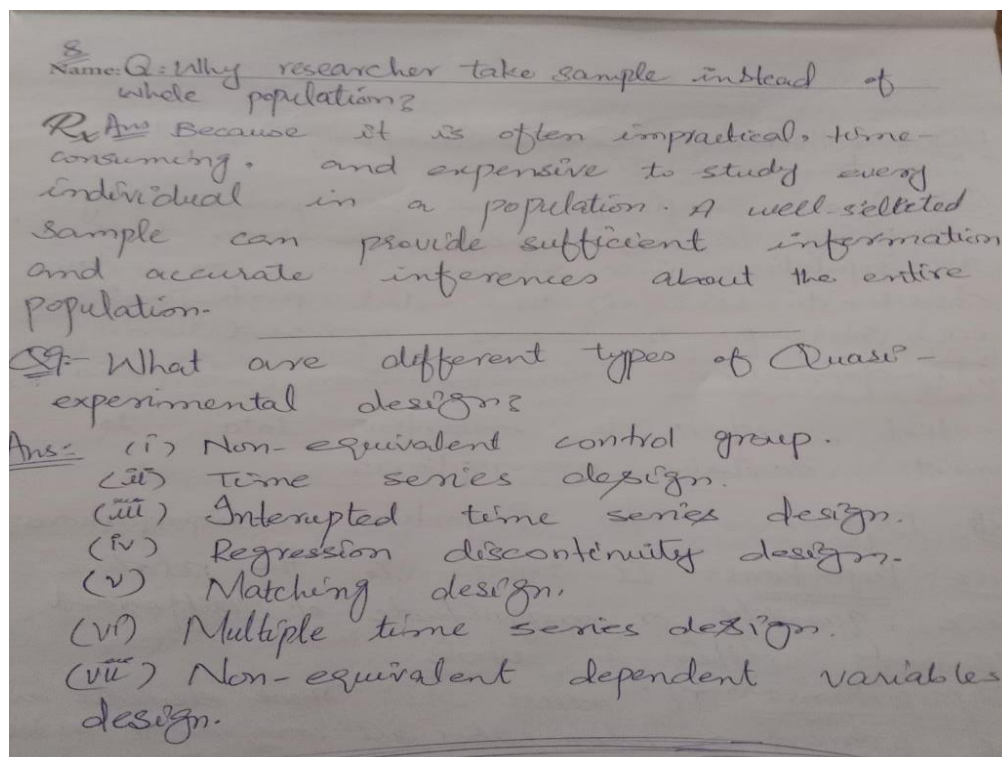

Ans:-

8. Why researcher take sample instead of whole population? Q8 ans sunny bahi file

9. What are different types of quasi experimental design? Q9 ans sunny bahi file

Ans:-

10. What is quota sampling and transformation? Q10 ans sunny bahi file

11. Proportions and disproportion? Q11 ans sunny bahi file

Ans:-

Q11:- What is Quota Sampling and transformations
Ans: Quota sampling is a non-probability sampling technique where researchers divide a population into subgroups based on certain characteristics (Quotas). then select participant in each subgroup to ensure representation.
→ Transformation:- Transformation, in this context, refers to converting data to meet certain assumptions.
Q11 Difference b/w Proportions or disproportions?
Ans: Proportions:- It refers to the relative size, quantity or magnitude of different elements within a whole.
Disproportions:- It occurs when these elements are not balanced or when ratios are unequal. It is used in mathematics, art or even discussions of social or economical inequalities.

12. Cover letter contain which things? Q12 ans sunny bahi file

13. Internal and external variables? Q13 ans sunny bahi file

14. Explain editing? Q14 ans sunny bahi file

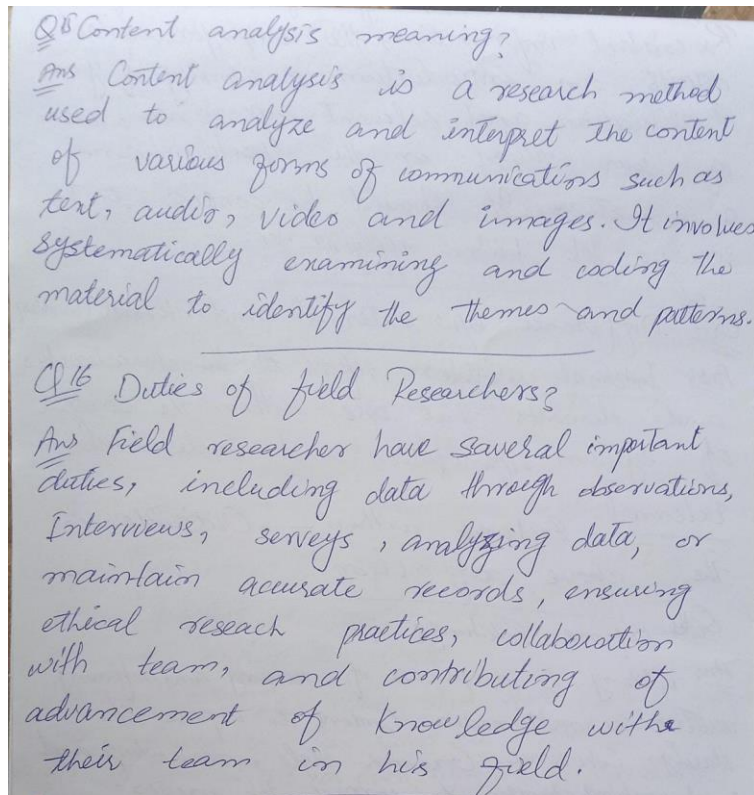

Ans:-

Q12 Name: Q:- Cover Letters Contains which things?
Ans: A cover letter typically includes your contact information, the employers contact details, an introduction, a summary of your qualification and relevant experience, reason of your interest in the position and a signature. It should be concise to the specific job you're applying for.
Q13 Difference b/w external and internal Variables
Ans: Internal variables refers to the characteristics and elements that are within the control of system organization and individual.
External: Exchange within → Outside. in the above definition.
Q14 Define Editing
Ans: Editing is a process of revising and refining written or multimedia content to improve its clarity, coherence, grammar style, reviewing and making changes to correct the errors.

15. Duties of field research? Q16 ans sunny bahi file

16. Type of non probability sampling? Q17 ans sunny bahi file

Ans:-

17. Questionnaire survey?

Ans:- Questionnaire surveys are a technique for gathering statistical information about the attributes, attitudes, or actions of a population by a structured set of questions.

18. Why you analyze from Solomon group design explain?

Ans:- (both same ans on handout and slides)

Q18 Aug2023

Solomon's Four Group Design: To gain more confidence in internal validity in experimental designs, it is advisable to set up two experimental groups and two control groups. One experimental group and one control group can be given the both pretest and the posttest. The other two groups will be given only the posttest. Here the effects of treatment can be calculated in several different ways as shown in figure 1.

Figure 1: Solomon's four group design

Group	Pretest	Treatment	Posttest
1. Experimental	O1	X	O2
2. Control	O3	-	O4
3. Experimental	-	X	O5
4. Control	-	-	O6

$(O2 - O1) = E$
 $(O4 - O3) = E$
 $(O5 - O6) = E$
 $(O5 - O3) = E$
 $[(O2 - O1) - (O4 - O3)] = E$
E = Effect

© Copyright Virtual University of Pakistan 118

Research Methods - STA630 VU

If all Es are similar, the cause and effect relationship is highly valid.

Solomon 4 Group Design:

- To gain more confidence, it is advisable to set up 2 exp groups and 2 cont groups. One exp and one control group be given both pretest and posttest. Other two are given posttest only.
- Exp: Pretest (O1) X Posttest (O2)
- Con: Pretest (O3) - Posttest (O4)
- Exp: - X Posttest (O5)
- Con: - - Posttest (O6)
- $(O2 - O1) = E$ $(O2 - O4) = E$
- $(O5 - O6) = E$ $(O5 - O3) = E$
- $[(O2 - O1) - (O4 - O3)] = E$
- If all Es are similar, the cause and effect relationship is highly valid.

19. Ethical dilemma face the interviewer? Q18 ans sunny bahi file

Ans:-

Name: Q: Types of non-probability sampling?

- Ans: Convenience Sampling → It is called accidental sampling or haphazard sampling.
- (ii) Purposive Sampling → It is also called judgemental or expert opinion sample.
- (iii) Quota Sampling → It is the exact extent of the researcher's desire.
- (iv) Snowball Sampling → It is also called network, chain referral or reputational sampling.
- (v) Sequential Sampling → Similar to purposive sample with one difference.
- (vi) Theoretical Sampling → What the researcher is sampling (people, situation, time periods etc).

Q: Ethical Dilemmas of field research?

- Ans: (i) Deception (iv) The powerful
- (ii) Confidentiality (v) Publishing field reports.
- (iii) Involvement with deviants

20. Systematic random sampling?

Ans:-

Systematic Random Sample Q19 Aug2023

Systematic random sampling is simple random sampling with a short cut for random selection. Again, the first step is to number each element in the sampling frame. Instead of using a list of random numbers, researcher calculates a sampling interval, and the interval becomes his or her own quasi random selection method. The sampling interval (i.e. 1 in K where K is some number) tells the researcher how to select elements from a sampling frame by skipping elements in the frame before one for the sample.

21. What are central tendency and its three methods?

Ans:-

Q21 Aug2023

Researchers often want to summarize the information about one variable into a single number. They use **three measures of central tendency** or measures of the center of the frequency distribution: mean, median and mode, which are often called averages (a less precise and less clear way to say the same thing). The *mode* is simply the most common or frequently occurring number. The *median* is the middle point. The *mean* also called the arithmetic average, is the most widely used measure of central tendency. A particular **central tendency** is used depending upon the nature of the data.

22. Steps in field research?

Ans:-

24. **Enlist the steps in field research.** Q22 Aug2023

1. Prepare yourself, read the literature and defocus.
2. Select a site and gain access.
3. Enter the field and establish social relations with members.
4. Adopt a social role, learn the ropes, and get along with members.
5. Watch, listen, and collect quality data.
6. Begin to analyze data, generate and evaluate working hypothesis.
7. Focus on specific aspects of the setting and use theoretical sampling.
8. Conduct field interviews with member informants.
9. Disengage and physically leave the setting.
10. Complete the analysis and write the report.

23. What does field researchers do?

Ans:-

28. **Field research** Q23 Aug2023

Observation studies can be participant or non-participant. In participant observation the researcher directly observes and participates in small scale social settings in the present time. Such a study is also referred to as **field research**, ethnography, or anthropological study. Here the researchers:

- Study people in their natural settings, or in situ.
- Study people by directly interacting with them.
- Gain an understanding of the social world and make theoretical statements about members' perspective.

Field researchers study people in a location or setting. It has been used to study entire communities. Field research has a distinct set of methodologies. Field researchers directly observe and interact with community members in natural settings to get inside their perspectives

24. Disadvantage of content analysis?

Ans:-

Disadvantages of Content Analysis: Q24 Aug2023

1. **Bias:** Many documents used in research were not originally intended for research purposes. The various goals and purposes for which documents are written can bias them in various ways.
2. **Selective survival:** Since documents are usually written on paper, they do not withstand the elements well unless care is taken to preserve them. Thus while documents written by famous people are likely to be preserved, day-to-day documents such as letters and diaries written by common people tend either to be destroyed or to be placed in storage and thus become inaccessible.
3. **Incompleteness:** Many documents provide incomplete account to the researcher who has had no prior experience with or knowledge of the events or behavior discussed.
4. **Lack of availability of documents:** In addition to the bias, incompleteness, and selective survival of documents, there are many areas of study for which no documents are available. In many cases information simply was never recorded. In other cases it was recorded, but the documents remain secret or classified, or have been destroyed.
5. **Sampling bias:** One of the problems of bias occurs because persons of lower educational or income levels are less likely to be represented in the sampling frames
6. **Limited to verbal behavior:** By definition, documents provide information only about respondent's verbal behavior, and provide no direct information on the respondent's nonverbal behavior, either that of the document's author or other characters in the document.

7. **Lack of standardized format:** Documents differ quite widely in regard to their standardization of format.
8. **Coding difficulties:** For a number of reasons, including differences in purpose for which the documents were written, differences in content or subject matter, lack of standardization, and differences in length and format, coding is one of the most difficult tasks facing the content analyst.
9. **Data must be adjusted for comparability over time:** Although one of the advantages of document study is that comparisons may be made over a long period of time, since external events cause changes so drastic that even if a common unit of measure is used for the entire period, the value of this unit may have changed so much over time that comparisons are misleading unless corrections are made. Look at the change in measuring distance, temperature, currency, and even literacy in Pakistan.

25. Guidelines for questionier?

Ans:-

Guidelines for Questionnaire Design Q25 Aug2023

A survey is only as good as the questions it asks. Questionnaire design is one of the most critical stages in the survey research process. While common sense and good grammar are important in question writing, more is required in the art of questionnaire design. To assume that people will understand the questions is common error. People may not simply know what is being asked. They may be unaware of topic of interest, they may confuse the subject with something else, or the question may not mean the same thing to every respondent. Respondents may simply refuse to answer personal questions. Further, properly wording the questionnaire is crucial, as some problems may be minimized or avoided altogether if a skilled researcher composes the questions.

A good questionnaire forms an integrated whole. The researcher weaves questions together so they flow smoothly. He or she includes introductory remarks and instructions for clarification and measures each variable with one or more survey questions.

26. The role of interviewer?

Ans:-

The Role of the Interviewer: Survey research interviewing is a specialized kind of interviewing. As with most interviewing, its goal is to obtain accurate information from another person. Q26 Aug2023

The survey interview is a social relationship. Like other social relationships, it involves social roles, norms, and expectations. The interview is a short-term, secondary social interaction between two strangers with the explicit purpose of one person's obtaining specific information from the other. The social roles are those of the interviewer and the interviewee or respondent. Information is obtained in a structured conversation in which the interviewer asks prearranged questions and records answers, and the respondent answers.

The **role of interviewer** is difficult. They obtain cooperation and build rapport, yet remain neutral and objective. They encroach on respondents' time and privacy for information that may not benefit the respondents. They try to reduce embarrassment, fear, and suspicion so that respondents feel comfortable revealing information. They explain the nature of the survey research or give hints about social roles in an interview. Good interviewers monitor the pace and direction of the social interaction as well as content of the answers and the behavior of the respondents.

Survey interviewers are nonjudgmental and do not reveal their opinions, verbally or nonverbally. If the respondent asks for an interviewer's opinion, he or she politely redirects the respondent and indicate that such questions are inappropriate.

27. Some tip for interviewing?

Ans:-

SOME TIPS FOR INTERVIEWING

Q27 Aug2023

- Know the culture of the people in advance.
- Appearance – wear acceptable dress.
- Pleasantness and flexibility.
- Carry the letter of authority.
- Establish credibility and rapport. Motivating individuals to respond.
- Familiarity with the questionnaire.
- Following the question wording/ question order
- Recording responses exactly.
- Probing for responses.
- Closing the interview. No false promises. Also don't burn your bridges.
- Edit the questionnaire in the first available opportunity.

28. Types of probability sampling?

Ans:-

Types of probability

Q28 Aug2023

- Simple Random Sample
- Systematic Random Sample
- Stratified Random Sample
- Cluster Sampling
- Double Sampling

29. Why it is necessary to defocus our mind before field research?

Ans:-

A researcher first empties his or her mind of preconceptions and **defocuses**. There are two types of defocusing. The first is casting a wide net in order to witness a wide range of situations, people, and setting – getting a feel of the overall setting before deciding what to include or exclude. The second type of defocusing means not focusing exclusively on the role of researcher. It may be important to extend one's experience beyond a strictly professional role. Another preparation for field research is self knowledge. A field researcher needs to know him or herself and reflect on personal experiences. He or she can expect anxiety, self doubt, frustration, and uncertainty in the field. Also all kinds of stereotypes about the community should be emptied.

Q29
Aug20
23

30. Cluster sampling design?

Ans:-

• **Cluster Sampling:** Q30 Aug2023

- Purpose: sample economically and retaining probability sampling.
- Heterogeneity within clusters but homogeneity between clusters.
- Random selection of clusters.
- Random selection of elements within the selected clusters.
- Cluster sampling addresses two problems
- Researchers lack good sampling frame for dispersed population
- Reaching each sampled element is costly.
- The unit costs of cluster sampling are much lower than those of other probability sampling designs.
- However, cluster sampling exposes itself to greater biases at each stage of sampling.

31. Do explain interferences from non reactive data by using secondary data?

Ans:

32. Research process once collect a data How u would perform theoretical activity?

Ans:-

Do explain interferences from non reactive data by using secondary data?

Interference from non-reactive data occurs when secondary data collected for a different purpose is used to draw conclusions about a new context. This can lead to inaccurate insights due to differences in the original data collection methods, objectives, or context. To avoid interference, it's essential to carefully assess the relevance, reliability, and comparability of the secondary data before applying it to the new situation.

Research process once collect a data how u would perform theoretical activity?

After collecting data, the theoretical activity typically involves analyzing and interpreting the data within the context of existing theories and literature. This involves steps like data cleaning, organizing, and summarizing the data. Then, you would compare your findings with existing theories, identifying patterns, relationships, and implications. This process helps you draw conclusions and contribute to the theoretical framework.

33. Would you explain spontaneity and confession by using secondary data with examples?

Ans:-

Spontaneity: The spontaneous actions or feelings can be recorded when they occurred rather than at a time specified by the researcher. If the respondent was keeping a diary, he or she may have been recording spontaneous feelings about a subject whenever he or she was inspired to do so. The contents of such personal recording could be analyzed later on.

Q33 Aug2023

Confessions: A person may be more likely to confess in a document, particularly one to be read only after his or her death, than in an interview or mailed questionnaire study. Thus a study of documents such as diaries, posthumously published autobiographies, and suicide notes may be the only way to obtain such information.

Relatively low cost: Although the cost of documentary analysis can

34. What do you know about number and duration of FSD?

35. Write the note on non reactive?

Ans:-

Reactive, non-reactive research, Q35 Aug2023

Experiments and surveys research are both **reactive**; that is, the people being studied are aware of the fact that they are being studied.

In non-reactive research, those being studied are not aware that they are part of a research project. Such a research is largely based on positivistic principles but is also used by interpretive and critical researchers.

36. Observation?

Ans:-

Observations: Q36 Aug2023

- **External Appearance:** How people appear may indicate social factors. For example, a researcher watches students to see whether they are more likely to wear their college's colors and symbols after the college team won or lost.
- **Count Behaviors:** Counting how many people do something can be informative. For example a researcher may count the number of men and women who come to a full stop and those who come to a rolling stop at a traffic stop sign. This suggests gender difference in driving behavior.
- **Time Duration:** How long people take to do things may indicate their intention. For example a researcher may measure how long men and women pause in front of a particular painting. Time taken may indicate their interest in the painting.

37. What is sampling frame and sampling frame error?

Ans:- The **sampling frame** is the list from which units are drawn for the sample. The 'list' may be an actual listing of units, as in a phone book from which phone numbers will be sampled, or some other description of the population, such as a map from which areas will be sampled. A **sample frame error** occurs when a sample is selected from the wrong population data. A **sample frame error** occurs when the wrong sub-population is used to select a sample. Finally, a non-response error occurs when potential respondents are not successfully contacted or refuse to respond.

38. How researcher locate the evidence in the hc research?

Ans:-

Organizing Evidence Q38 Aug2023

As a researcher gathers **evidence and locates** new sources, he or she begins to organize the data. Obviously, it is unwise to take notes madly and let them pile up haphazardly. A researcher usually begins a preliminary analysis by noting low-level generalizations or themes. For example, in a study of revolution, a researcher develops a theme: The rich peasants supported the old regime. He or she can record this theme in his or her notes and later assign to significance.

Researcher organizes evidence, using theoretical insights to stimulate new ways to organize data and for new questions to ask of evidence. The interaction of data and theory means that a researcher goes beyond a surface examination of the evidence based on theory. For example, a researcher reads a mass of evidence about a protest movement. The preliminary analysis organizes the evidence into a theme: People who are active in protest interact with each other and develop shared cultural meanings. He or she examines theories of culture and movements, then formulates new concept: "oppositional movement subculture." The researcher then uses this concept to re-examine the evidence.

39. How you can differ between frequency and bivariate distribution table?

Ans:-

How you can differ between frequency and bivariate distribution table?

A frequency distribution table displays the frequency or count of occurrences of individual values in a dataset, usually for a single variable. On the other hand, a bivariate distribution table shows the frequency or count of pairs of values from two different variables in a dataset, providing insights into their joint occurrence. In short, a frequency distribution focuses on a single variable, while a bivariate distribution involves two variables and their interactions.

41. What are the functions of recorders?

Ans:-

40. Being a researcher how would you criticize the use of secondary research?

Ans:-

40. Being a researcher how would you criticize the use of secondary research?

As a researcher, I would acknowledge that secondary research has its limitations. It may lack originality and firsthand data, leading to potential biases from the original sources. Additionally, the quality and reliability of secondary sources can vary widely. It's important to critically evaluate the methodology, relevance, and credibility of the sources used in secondary research.

42. Components of bivariate table?

Ans:-

What are the functions of recorder in research shortly

Recorders in research serve to collect, document, and preserve data—enabling accurate analysis, verification, and transparent reporting of findings. They're particularly valuable for qualitative research, ethnographic studies, longitudinal observations, and remote data collection.

What are the components of bivariate table?

A bivariate table typically consists of two variables, often displayed in rows and columns. The components include the row and column headers, which represent the categories or values of each variable, and the cells in the table which contain the counts or frequencies of occurrences for combinations of the two variables. This table format is useful for analyzing the relationship between two categorical variables.

43. How history effect different from mechanical loss in research?

Ans:-

Q43 Aug2023

1. **History Effect:** A specific event in the external environment occurring between the first and second measurement that is beyond the control of the experimenter and that affects the validity of an experiment. Advertisement of a particular product (mineral water) and its sale is affected by an event in the society (contamination of drinking water). The researcher does not have control on such happenings which have an impact on the X and Y relationship.

8. **Mechanical Loss:** A problem may be experienced due to equipment failure. For example, in an experiment if the subjects are told that their behavior is being video taped, and during the experiment the video equipment failed to work for some subjects, then the validity of the results could become doubtful.

44. Explain important measurements and coding in non research helo of example?

Ans:-

Explain important measurements and coding in non research helo of example shortly?

Sure! In a non-research context, important measurements refer to data that you gather to understand or monitor something. For example, tracking your daily steps with a fitness tracker is an important measurement for your health.

Coding, in this context, means writing instructions for a computer to follow. For instance, creating a shopping app involves coding to tell the app how to display products, handle payments, and more. It's like giving the app a set of rules to function properly.

45. Why pilot testing used in experimental research?

Ans:-

Why pilot testing used in experimental research?

Pilot testing is used in experimental research to identify and address any potential issues or flaws in the research design before conducting the actual study. It helps researchers refine their methods, assess the feasibility of the study, and make necessary adjustments to ensure that the main study will yield accurate and reliable results.

46. Explain instrument effect examples?

Ans:-

4. **Instrumentation Effects:** Q46 Aug2023

Instrumentation effects are yet another source of threat to internal validity. These might arise because of a change in the measuring instrument between pretest and posttest, and not because of the instrument's differential impact at the end. For example, in a weight-loss experiment, the springs on the scale weaken during the experiment, giving lower readings in the posttest.

A change in the wording of questions (may be done to avoid testing effects), change in interviewers, or change in other procedures to measure the dependent variable can cause instrumentation effect. Performance of the subjects measured by the units of output in the pretest, but when measuring the output in posttest the researcher measures it by "the number of units rejected, and the amount of resources expended to produce the units.

47. While construct a code book two basic rules follow mutually exclusive and exhausted what do you know about these term?

48. Give two limitations of trivariate table?

Ans:-

What are the limitations of tri-variate tables? Explain any two

Trivariate tables have three limitations. Q48 Aug2023

1. First, they are difficult to interpret if a control variable has more than four categories.
2. Second, control variables can be at any level of measurement, but interval or ratio control variables must be grouped (i.e. converted to an ordinal level), and how cases are grouped can affect the interpretation of effects.
3. Finally, the total number of cases is a limiting factor because the cases are divided among cells in partials. The number of cells in the partials equals the number of cells in the bivariate relationship multiplied by the number of categories in the control variables.

For example if the control variable has three categories, and a bivariate table has 12 cells, the partials have $3 \times 12 = 36$ cells. An average of five cases per cell is recommended, so the researcher will need $5 \times 36 = 180$ cases at minimum.

49. Importance of sample in research?

Ans:-

What is the Importance of sample in research?

The importance of a sample in research lies in its representation of the larger population. A well-chosen sample allows researchers to draw valid conclusions and make generalizations about the entire population, while reducing costs and time. A carefully selected sample minimizes bias and enhances the reliability of research findings.

50. Why self administration questionnaire used personally?

Ans:-

Why self administration questionnaire used personally?

A self-administered questionnaire is often used personally for self-assessment or self-reflection. It allows individuals to gather information about their thoughts, feelings, behaviors, or experiences in a structured way. This can be helpful for self-awareness, tracking progress, identifying patterns, or even preparing for discussions with professionals. Keep in mind that for more accurate assessments, combining self-administered questionnaires with insights from experts can be beneficial.

51. Field and lab experiment?

52. 5 Principal of interview?

Ans:-

Field and lab experiments shortly

Field experiments are conducted in real-world settings, often involving manipulating variables to observe their impact on participants or the environment. Lab experiments, on the other hand, take place in controlled laboratory environments, allowing for precise control over variables but potentially lacking real-world context. Both methods contribute valuable insights to various scientific disciplines.

Ans:-

5 principal of interview shortly?

Sure, here are the 5 principles of an interview:

- 1. **Preparation:** Research the topic and interviewee beforehand.
- 2. **Engagement:** Create a comfortable atmosphere for open conversation.
- 3. **Active Listening:** Pay close attention to responses, ask follow-up questions.
- 4. **Relevance:** Ask questions that relate to the interviewee's expertise or experience.
- 5. **Respect:** Treat the interviewee with courtesy and professionalism.

53. What is bracketing regard to historical comparative research?

Ans:-

What is bracketing regard to historical comparative research?

In historical comparative research, bracketing refers to the process of setting aside one's own assumptions, biases, and preconceptions about a particular historical period or culture. This allows researchers to approach their analysis with a more objective perspective and avoid projecting contemporary ideas onto the past. Bracketing helps ensure that interpretations of historical events and societies are grounded in the context of their time rather than influenced by present-day viewpoints.

54. Treatment of independent variables

Ans:-

Treatment of independent variables

Treatment of independent variables refers to the manipulation or categorization of these variables in an experiment or study to observe their effects on the dependent variable. This can involve factors like controlling for confounding variables, randomizing the order of presentation, or creating different levels or groups for comparison. Properly treating independent variables is crucial to ensure accurate and reliable results in research.

Long and short question were totally conceptual

Questions topic

Probability sampling and non probability sampling

Ans:-

3. Probability and non probability. 15Aug2023

Probability:

In probability sampling every element in the population has a known nonzero probability of selection. The simple random is the best known probability sample, in which each member of the population has an equal probability of being selected. Probability sampling designs are used when the representativeness of the sample is of importance in the interest of wider generalizability.

Non Probability:

In non-probability sampling the probability of any particular element of the population being chosen is unknown. The selection of units in non-probability sampling is quite arbitrary, as researchers rely heavily on personal judgment. It should be noted that there are no appropriate statistical techniques for measuring random sampling error from a non-probability sample. Thus projecting the data beyond the sample is statistically inappropriate. When time or other factors, rather than generalizability, become critical, non-probability sampling is generally used.

Simple random sampling

Ans:-

Simple Random Sample 15Aug2023

The simple random sample is both the easiest random sample to understand and the one on which other types are modeled. In simple random sampling, a research develops an accurate sampling frame, selects elements from sampling frame according to mathematically random procedure, then locates the exact element that was selected for inclusion in the sample.

One shot case study

Ans:-

One-shot Case Study Design: 15Aug2023

Also called the one-group posttest-only design, the one-shot case study design has only one group, a treatment, and a posttest. Because it is only one group, there is no random assignment. For example, a researcher shows a group of students a horror film, and then measures their attitude with a questionnaire. A weakness of this design is that it is difficult to say for sure that the treatment caused the dependent variable. If subjects were the same before and after the treatment, the researcher would not know it.

Disadvantages of self administration

Ans:-

Questionnaire

Ans:-

What is bracketing regard to historical comparative research?

In historical comparative research, bracketing refers to the process of setting aside one's own assumptions, biases, and preconceptions about a particular historical period or culture. This allows researchers to approach their analysis with a more objective perspective and avoid projecting contemporary ideas onto the past. Bracketing helps ensure that interpretations of historical events and societies are grounded in the context of their time rather than influenced by present-day viewpoints.

Treatment of independent variables

Treatment of independent variables refers to the manipulation or categorization of these variables in an experiment or study to observe their effects on the dependent variable. This can involve factors like controlling for confounding variables, randomizing the order of presentation, or creating different levels or groups for comparison. Properly treating independent variables is crucial to ensure accurate and reliable results in research.

Ethical dilemma 5 Repeat

Egd Wala bhi tha

Ans:-

FGD long 15Aug2023

In research, focus group discussions (FGD) are a more formal way of getting groups of people to discuss selected issues. A focus group discussion is a group discussion of 6-12 persons guided by a facilitator, during which group members talk freely and spontaneously about a certain topic. There may be some disagreement about the exact number of participants in the discussion, as one comes across variations in numbers (6 to 10, 6 to 12, 6 to 15, 8 to 10, 5 to 7) in different books on research methods.

Uses of Focus Group Discussions

- The primary advantage of focus groups is its ability to quickly and inexpensively grasp the core issues of the topic.
- As part of exploratory research, focus group discussions help the researcher to focus on the issue and develop relevant research hypotheses.
- Focus group discussion is an excellent design to get information from non-literates.
- Focus group discussions are a good means to discover attitudes and opinions that might not be revealed through surveys.
- Focus group discussions are well accepted in the folk communities, as this form of communication already exists whereby the local communities try to sort out controversial issues.
- Focus group discussions generate new ideas, questions about the issues under consideration. It may be called serendipity (surprise ideas). It is more often the case in a group than in an individual interview that some idea will drop out of the blue.
- Focus group discussions can supplement the quantitative information on community knowledge, attitude, and practice (KAP), which may have already been collected through survey research.
- Focus group discussions are highly flexible with respect to topic, number of participants, time schedule, location, and logistics of discussion.
- Focus group discussions provide a direct link between the researcher and the population under study.
- For some researchers, focus group discussions may be a fun. They enjoy discussing the issues directly with the relevant population.

Control group bhi long tha

Ans:-

The group that does not receive the treatment is called the "control group." When the independent variable takes on many different values, more than one experimental group is used. 15Aug2023

In the simplest type of experiment, only two values of the independent variable are manipulated. For example, consider measuring the influence of a change in work situation, such as playing music over an intercom during working hours, on employee productivity. In the experimental condition (the treatment administered to the **experimental group**), music is played during working hours. In the control condition (the treatment administered to the **control group**), the work situation remains the same, without change. By holding conditions constant in the control group, the researcher controls for potential sources of error in the experiment. Productivity, (the dependent variable) in the two groups is compared at the end of the experiment to determine whether playing the music (the independent variable) has any effect.

Several experimental treatment levels can also be used. The music/productivity experiment, with one experimental and one control group, may not tell the researcher everything he or she wishes to know about the music/productivity relationship. If the researcher wished to understand the functional nature of the relationship between music and productivity at several treatment levels, additional experimental groups with music played for only 2 hours, only for 4 hours, and only for 6 hours might be studied. This type of design would allow the experimenter to get a better idea about the impact of music on productivity.

Basics for interviewing

Ans:-

PRINCIPLES OF INTERVIEWING (The Basics) 15Aug2023

- *Have integrity and be honest.* This is the cornerstone of all professional inquiry, regardless of its purpose.
- *Have patience and tact.* Interviewers ask for information from people they do not know. Thus all the rules of human relations that apply to inquiry situations – patience, tact, courtesy – apply “in spades” to interviewing.
- *Have attention to accuracy and detail.* Among the greatest interviewing “sins” are inaccuracy and superficiality, for the professional analyst can misunderstand, and in turn mislead, a client. Do not record the answer unless you fully understand it yourself. Probe for clarification and detailed full answers.
- *Exhibit a real interest in the inquiry at hand, but keep your opinions to yourself.* Impartiality is imperative.
- *Be a good listener.* Some interviewers talk too much, wasting time when respondents could be supplying more pertinent facts or opinions on the topic.
- *Keep the inquiry and respondents' responses confidential.* Do not discuss the studies you are doing with relatives, friends, or associates. Never quote one respondent's opinion to another.
- *Respect others' rights.* Survey research depends on the goodwill of others to provide information. There should be no coercion. زبردستی. Impress on prospective respondents that their cooperation is important and valuable.

... Mean. Mode. Median

Ans:-

~~summarize describe one variable~~

15Aug2023

Researchers often want to summarize the information about one variable into a single number. They use three measures of central tendency, or measures of the center of the frequency distribution: mean, median and mode, which are often called averages (a less precise and less clear way to say the same thing). The mode is simply the most common or frequently occurring number. The median is the middle point. The mean also called the arithmetic average, is the most widely used measure of central tendency. A particular central tendency is used depending upon the nature of the data.

... Which survey aur research is more suitable for given 3 conditions

Ans:-

Data transformation with examples 15Aug2023

Data transformation is the process of changing data from their original form to a format that is **more suitable** to perform a data analysis that will achieve the research objectives.

Researchers often modify the values of a scalar data or create new variables.

For example many researchers believe that response bias will be less if interviewers ask consumers for their year of birth rather than their age, even though the objective of the data analysis is to investigate respondents' age in years. This does not present a problem for the research analyst, because a simple data transformation is possible. The raw data coded at birth year can be easily transformed to age by subtracting the birth year from the current year.

.....dilemmas ka aik Qs tha... **Repeat**

Paper#5

Sta630 15aug2023

- **Probability and non probability sampling technique.. Repeat**
- **Longitudinal and cross sectional study..**

Ans:-

15Aug2023

Cross-Sectional Studies are carried out **once** and represent a snapshot of one point in time. Data are collected just once, perhaps over a period of days or weeks or months, in order to answer the research question.

Longitudinal Studies are repeated over an extended period. The advantage of longitudinal studies is that it can track changes over time. For example, the researcher might want to study employees' behavior before and after a change in the top management, so as to know what effects the change accomplished. Here, because data are gathered at two different points in time, the study is not cross-sectional or of the one-shot kind, but is carried longitudinally across a period of time. Such studies, as when data on the dependent variable are gathered at two or more points in time to answer the research question, are called longitudinal. Longitudinal studies can be *panel studies* and *cohort studies* which were discussed earlier.

- **Ethical dilemmas of field research...**

Ans:-

Ethical Dilemmas of Field research 15Aug2023

The direct personal involvement of a field researcher in the social lives of other people raises many ethical dilemmas. The dilemmas arise when the researcher is alone in the field and has little time to make a moral decision. Although he or she may be aware of general ethical issues before entering the field, they arise unexpectedly in the course of observing and interacting in the field. Let us look at some of these dilemmas:

Deception: Deception arises in several ways in field research. The research may be covert; or may assume a false role, name, or identity; or may mislead members in some way. The most hotly debated of the ethical issues arising from deception is that of covert versus overt field research. Some support it and see it as necessary for entering into and aiming a full knowledge of many areas of social life. Others oppose it and

MUHAMMAD IMRAN 9

argue that it undermines a trust between researchers and society. Although its moral status is questionable, there are some field sites or activities that can only be studied covertly. One may have to look into the cost and benefit equation; where the researcher is the best judge.

Covert research is never preferable and never easier than overt research because of the difficulties of maintaining a front and the constant fear of getting caught.

- **Field interview or survey interview ye question thy.**

Ans:-

1. Survey interview and field interview difference 1.5 marks and why standard of question remain same in survey interview and changed in field interview? 1.5 marks 15Aug2023

Survey Interview	Field Interview
1. It has clear beginning and end.	1. The beginning and end are not clear. The interview can be picked up later.
2. The same standard questions are asked of all respondents in the same sequence.	2. The questions and the order in which they are asked are tailored to specific people and situations.
3. The interviewer appears neutral at all times.	3. The interviewer shows interest in responses, encourages elaboration.
4. The interviewer asks questions, and the respondent answers.	4. It is like a friendly conversational exchange but with more interviewer questions.
5. It is almost always with one respondent alone.	5. It can occur in group setting or with others in area, but varies.
6. It has a professional tone and businesslike focus, diversions are ignored.	6. It is interspersed with jokes, aside, stories, diversions, and anecdotes, which are recorded.
7. Closed-ended questions are common, with rare probes.	7. Open-ended questions are common, and probes are frequent.
8. The interviewer alone controls the pace and direction of interview.	8. The interviewer and member jointly control the pace and direction of the interview.
9. The social context in which the interview occurs is ignored and assumed to make little difference.	9. The social context of the interview is noted and seen as important for interpreting the meaning of responses.
10. The interviewer attempts to mold the communication pattern into a standard framework.	10. The interviewer adjusts to the member's norms and language usages.

Short questions

1.scale and interval 2.why it is necessary for researcher to have social behavior quality

Ans:-

Define scale and interval in research

In research, a scale typically refers to a standardized set of questions or items designed to measure a specific construct or variable, such as attitudes, opinions, or behaviors. An interval in research refers to the numerical difference between two points on a measurement scale, where the intervals are equal and meaningful, but the scale doesn't have a true zero point. This means that while you can compare the differences between intervals, you cannot make meaningful statements about ratios between values on the scale.

Ans:-

why it is necessary for researcher to have social behavior quality shortly

Researchers benefit from good social behavior qualities because they enable effective collaboration, communication, participant interaction, ethical consideration, adaptation, conflict resolution, and public engagement, all of which enhance research quality and impact.

3.A researcher want to know the impact of teaching on learning outcomes. So he conduct a contrived controlled environment for this purpose. Which type he is following Field research. Lab experiment. Ex post facto

Ans:- mny lab experiment to explain kia tha because artificial environment

Experiments done to establish cause and effect relationship beyond the possibility of the least doubt require the creation of an artificial, contrived environment in which all the extraneous factor are strictly controlled. Similar subjects are chosen carefully to respond to certain manipulated stimuli. These studies are referred to as **lab experiments.** 15Aug2023

4.Is it possible to conduct true experimental 5.researcher want to gather data from an old research in social sciences by survey give family living in a house he sent them questionnaire your justification both in long and short is this way of survey is best or not then which

Ans:-

Is it possible to conduct true experimental research in social sciences by survey give your justification shortly

Yes, it's possible to conduct true experimental research in social sciences using surveys. Randomly assigning participants to groups and manipulating variables can help establish cause-and-effect relationships. While challenges exist due to ethics and complex human behavior, well-designed surveys still offer valuable insights into social phenomena.

way is best

Ans:-

researcher want to gather data from an old age family living in a house he sent them questionnaire is this way of survey is best or not then which way is best?

Using a questionnaire to gather data from an old age family can be effective, but it's important to consider their comfort and accessibility with technology. An alternative approach could be conducting in-person interviews or virtual interviews over video calls, depending on their preferences and technical abilities. This allows for more personalized interactions and ensures accurate data collection.

Subjective:

Q.1 History effect with example 3 marks

Ans:-

Q43 Aug2023 16Aug2023

1. **History Effect:** A specific event in the external environment occurring between the first and second measurement that is beyond the control of the experimenter and that affects the validity of an experiment. Advertisement of a particular product (mineral water) and its sale is affected by an event in the society (contamination of drinking water). The researcher does not have control on such happenings which have an impact on the X and Y relationship.

Q.2 What do you understand by Probing 3 marks

Ans:-

Probing 16Aug2023

Probing means the verbal prompts made by field worker when the respondent must be motivated to communicate his or her answer or to enlarge on, clarify or explain an answer. Probing may be needed for two types of situations. First, it is necessary when the respondent must be motivated to enlarge on, clarify, or explain his or her answer.

Q.3 Difference between Treatment and Depending variable 3 marks

Ans:-

1. **Treatment or independent variable:** 15Aug2023 The experimenter has some degree of control over the independent variable. The variable is independent because its value can be manipulated by the experimenter to whatever he or she wishes it to be. Its value may be changed or altered independently of any other variable.

Q.4 Statment ko justify krna tha 3 marks

Q.5 Editing Technique 3 marks

Editing 16Aug2023

- Process of checking and adjusting the data for omissions, legibility and consistency.
- Purpose is to ensure the completeness, consistency and readability of data to be transferred storage.
- Editor may have to reconstruct some data (weekly income converted into monthly income)
- Bring to light the hidden values without bias.
- Editing is not coding because Coding is assignment of numbers of symbols to previously edited data.
- Editing can be field editing or In-house Editing.

Q.6 Two limitations of secondary resources in Historical-comparative research 5 marks

Ans: -

Two limitations of secondary resources in historical-comparative research?

Two limitations of secondary resources in historical-comparative research are potential inaccuracies or biases present in the sources, and the possibility of missing out on nuanced context that might be available in primary sources.

Q.7 Anonymity is a disadvantage of mail questionnaire. Justify the statement 5 marks

Ans:-

Anonymity is a disadvantage of mail questionnaire. Justify the statement shortly

Anonymity in mail questionnaires can lead to incomplete or inaccurate responses due to the lack of accountability, making it harder to verify the validity of the information provided by respondents.

Questions

Differentiate between internal validity and external validity.

Ans: -

Difference in Internal or external validity 16Aug2023

Internal validity:

Internal validity is high in the laboratory experiment, reason being the control over all the confounding factors. External validity (generalizability) is not sure because of the effect of variety of factors. Field experiments have more external validity but less internal validity because it is closer to the real situations.

External Validity:

Even if the researcher eliminates all concerns for internal validity, external validity remains a potential problem. External validity is the ability to generalize experimental findings to real life situations. Without external validity, the findings are of little use for both basic and applied research i.e. we shall not be able to develop any theories that could be applicable to similar other situations.

Limitations of simple random sampling .

Ans: -

Limitations of simple random sampling

Simple random sampling can be limited by its potential for sampling bias, as it might not accurately represent the entire population if certain groups are underrepresented. Additionally, it can be time-consuming and costly to implement when the population is large and geographically dispersed.

Bivariate table Sy related ek question tha .

Paper#10

[8/16, 2023] STA630 4.30pm

Ppr ma handouts sa q thy mostly or kuch conceptual tha or kuch file m sa thy ...
Isky elawa long ma control group ki significance thi

Ans: -

control group significance

In experimental research, a control group is a group that does not receive the experimental treatment and serves as a baseline for comparison. The significance of a control group lies in its ability to help researchers determine whether any observed effects are truly due to the experimental treatment or simply occur by chance. By comparing the outcomes of the control group with those of the experimental group, researchers can assess the true impact of the treatment and draw meaningful conclusions about its effects.

Simple random sampling or systematic random sampling ma difference Aya tha with examples.

Ans:-

1. **Simple Random Sample:** 16Aug2023

- Assumption –homogeneous population.
- Develop an accurate sampling frame.
- Locate the exact element/s to be selected i.e. decide the sample size.
- Number all the elements in the sampling frame.
- Use the list/table of random numbers.

2. **Systematic Random Sample:**

- Short cut for simple random sampling.
- Number each element in the sampling frame.
- Instead of using the table of random numbers, researcher develops a system for the selection of elements.
- Calculate the sampling interval. Basis of random selection
- Sample size/Population size X 100 i.e. sample as % of Pop.
- Begin with a random start.
- Draw sample by choosing every Nth case.
- If elements are organized in some pattern in the sampling frame then problem. Possible periodicity in population.

All other question were scenario base questions.

Paper#11

Sta630

Editing and coding diff

Ans: -

Difference between Editing and coding shortly

Coding involves writing new code from scratch, while editing involves modifying and improving existing code.

Historic comparative research

Ans:-

Define Historic comparative research

Historic comparative research involves analyzing historical data across different time periods or contexts to identify patterns, trends, and changes over time. This method helps researchers understand how societies, cultures, or phenomena have evolved and provides insights into the factors that have influenced those changes.

Pretest and posttest

16Aug2023

Pretests and Posttests: Frequently a researcher measures the dependent variable more than once during an experiment. The *pretest* is the measurement of the dependent variable prior to the introduction of the treatment. The *posttest* is the measurement of the dependent variable after the treatment has been introduced into the experimental situation.

Structured and unstructured interview "Divorce is mostly due to females" is a leading or loaded question?

Ans: -

Ans:-

Structured and unstructured interview

Structured interviews involve using a predetermined set of questions that are asked in a standardized manner to all participants. This approach allows for consistent data collection, making it easier to compare responses and draw conclusions. On the other hand, unstructured interviews are more flexible and conversational. The interviewer has a general topic in mind and encourages participants to share their thoughts freely, allowing for more in-depth exploration of individual perspectives and experiences.

"Divorce is mostly due to females" is a leading or loaded question?

The statement "Divorce is mostly due to females" could be considered a loaded question, as it assumes a certain premise and implies a biased perspective. It attributes a specific cause to divorce while ignoring a more complex reality involving a variety of factors that contribute to marital separations.

Index and scales diff

Ans:-

INDEXES AND SCALES 16Aug2023

- Scales and indexes are often used interchangeably. One researcher's scale is another's index.
- Both produce ordinal or interval level measures of variable. To add to the confusion, scale and index techniques can be combined in one measure.
- Scales and indexes give a researcher more information about variables and make it possible to assess the quality of measurement.
- Scales and indexes increase reliability and validity.
- They aid in **data reduction**; that is condense and simplify the information that is collected.

A scale is a measure in which the researcher captures the intensity, direction, level, or potency of a variable construct. It arranges responses or observation on a continuum. A scale can use single indicator or multiple indicators. **Most are at the ordinal level of measurement.**

An index is a measure in which a researcher adds or combines several distinct indicators of a construct into a single score. This composite score is often a simple sum of multiple indicators. It is used for content or convergent validity. **Indexes are often measured at the interval or ratio level.**

Researchers sometimes combine the features of scales and indexes in a single measure. This is common when a researcher has several indicators that are scales. He or she then adds these indicators together to yield a single score, thereby an index.

Paper#12

[10:27 PM, 8/25/2023]

Limitations of internet survey

Ans: -

Limitations of internet survey shortly

Internet surveys have limitations such as selection bias, as not everyone has online access. They may also suffer from response bias and lack of control over respondents' honesty and accuracy. Additionally, the inability to clarify questions in real-time and the potential for survey fatigue can impact data quality.

Human interaction survey

Ans:-

Human interaction survey shortly

Human interaction surveys aim to gather insights on social behaviors and relationships. They can provide valuable information, but limitations include reliance on self-reported data, potential bias due to respondents' perceptions, and the inability to capture nuanced nonverbal cues that play a significant role in face-to-face interactions.

Mr.Raza conduct experimental research on supervisor behavior and worker absenteeism. Cause and effect. Suggest three condition.

Ans:-

- 1.Positive reinforcement condition
- 2.Negative reinforcement condition
- 3.supportive leadership condition

Pilot testing

Ans:-

Pilot testing long 16Aug2023

Pilot testing also called pre-testing means small scale trial run of a particular component; here we are referring to pilot testing of the questionnaire.

Pilot testing involves the use of a small number of respondents to test the appropriateness of the questions and their comprehension. Usually, the draft questionnaire is tried out on a group that is selected on a convenience and that is similar in makeup to the one that ultimately will be sampled.

Paper#13

18-8-2023

○ Secondary source in Historical comparative research

Ans:-

2. Secondary Sources: 16Aug2023 Social researchers often use secondary sources, the books and articles written by specialist historians and other researchers, as an evidence of past conditions. It has its own limitations.

○ diff b/w Pretest and posttest with example Repeat

○ sequential and purposive sampling difference

Ans:-

5. Difference between purposive and sequential sampling (3marks) 16Aug2023

Sequential sampling is similar to purposive sampling with one difference.

In purposive sampling, the researcher tries to find as many relevant cases as possible, until time, financial resources, or his or her energy is exhausted.

The principle is to get every possible case. In sequential sampling, a researcher continues to gather cases until the amount of new information or diversity is filled. The principle is to gather cases until a saturation point is reached.

○ chose Target population and sampling frame from statement

Target population and sampling frame 16Aug2023

Ans:-

Target Population

Out of the conceptual variations what exactly the researcher wants to focus on. This may also be called a target population. Target population is the complete group of specific population elements relevant to the research project. Target population may also be called survey population i.e. that aggregation of elements from which the survey sample is actually selected.

At the outset of the sampling process, it is vitally important to carefully define the target population so that the proper source from which the data is to be collected can be identified. In our example of „college students” finally we may decide to study the college students from government institutions located in Lahore, who are studying social sciences, who are aged 19 years of age, and hailing from rural areas.

Sampling

Sampling is the process of using a small number of items or parts of a larger population to make conclusions about the whole population. It enables the researchers to estimate unknown characteristics of the population.

Sampling Frame

In actual practice the sample will be drawn from a list of population elements that is often different from the target population that has been defined. A sampling frame is the list of elements from which the sample may be drawn. A simple example could be listing of all college students meeting the criteria of target population and who are enrolled on the specified date.

A sampling frame is also called the working population because it provides the list that can be worked with operationally. In our example, such a list could be prepared with help of the staff of the selected colleges.

○ Mail Questionnaire convenient? Justify

Ans:-

Mail Questionnaire convenient? Justify shortly

Mail questionnaires can be convenient due to their wide reach and flexibility. Respondents can complete them at their own pace, and there's no need for real-time interaction. However, they also have limitations, including low response rates, potential for misinterpretation of questions, and lack of control over the completion process, which may impact data quality.

Content analysis is reactive or non reactive justify answer, 5 marks

Ans:-

18Aug2023

Content Analysis is Non-Reactive: It is non-reactive because the placing of words, messages, or symbols in a text to communicate to the reader or receiver occurs without influence from the researcher who analyzes its contents. There is no interaction between the researcher and the creator of the text under analysis.

Content analysis lets a researcher reveal the contents (i.e. messages, meanings, symbols, etc.) in a source of communication (i.e. a book, article, movie, etc.). It lets him/her probe into and discover content in a different way from ordinary way of reading a book or watching a television program.

With content analysis, a researcher can compare content across many texts and analyze it with quantitative techniques (table, charts). In addition, he or she can reveal aspects of the text's content that are difficult to see. For example, you might watch television commercials and feel that women are mostly portrayed working in the house, cooking food, using detergents, looking after children. Content analysis can document – in objective, quantitative terms – whether or not your vague feelings based on unsystematic observation are true. It yields repeatable, precise results about the text.

Content analysis involves random sampling, precise measurement, and operational definitions for abstract constructs. Coding turns aspects of content that represent variables into numbers. After a content analysis researcher gathers the data, he or she enters them into computers and analyzes them with statistics in the same way that an experiment or survey researcher would.

1 double barreled question ka scenario tha t marks ka

31) Double barreled question 18Aug2023

Double barreled question consists of two or more questions joined together. It makes the respondent's answer ambiguous. For example, if asked, "Are you satisfied and happy with your supervisor?"

Properly terminate na ho interview is k consequences 5 marks

Ans:-

. What are the consequences if the interview is not properly terminate? 18Aug2023

Fieldworkers should not close the interview before all the information has been secured. The interviewer whose departure is hasty will not be able to record those spontaneous comments respondents sometimes offer after all formal questions have been asked. Avoiding hasty departures is also a matter of courtesy.

13. how can experimental design be used in Social sciences 21Aug2023

Experimental research builds on the principles of positivist approach more directly than do the other research techniques. Researchers in the natural sciences (e.g. chemistry and physics), related applied fields (e.g. engineering, agriculture, and medicines) and the social sciences conduct experiments. The logic that guides an experiment on plant growth in biology or testing a metal in engineering is applied in experiments on human social behavior. Although it is most widely used in psychology, the experiment is found in education, criminal justice, journalism, marketing, nursing, political science, social work, and sociology.

5 non-reactive research k bary ma koi question tha 🤖. Repeat

Long question

1. Scenario tha ak os ma btana tha k kon c sampling use hoei or os sampling ki kon c type.
2. historical comparative research ka koi question tha. Repeat
3. telephone interview lana explanation with reason. 🤖

Ans:-

TELEPHONE INTERVIEWING: 21Aug2023 Telephone interviewing has been a mainstay بنیادی of commercial survey research. The quality of data obtained by telephone may be comparable to that collected in personal interviews. Respondents may even be more willing to provide detailed and reliable information on a variety of personal topics over the telephone than in personal interviews. Telephone surveys can provide representative samples of general population in most industrialized countries.

WEAKNESSES OF TELEPHONE INTERVIEWING:

1. **Absence of Face-to-Face Contact:** Telephone interviews are more impersonal than face-to-face interviews. Respondents may answer embarrassing in a telephone interview than in a personal interview.
2. **Response Rate is lower than for Personal Interviews:**
3. **Lack of Visual Medium:** Since visual aids cannot be utilized in telephone interview, research that requires visual material cannot be conducted by phone.
4. **Limited Duration:** Length of the interview is limited. Respondents who feel they have spent too much time in the interview will simply hang up. (A good rule is to plan telephone interviews to be approximately 10 minutes long).
5. **Many Numbers are unlisted or not working**
6. **Less Participant Involvement:**
7. **Distracting Physical Environment:** Multiple phones distract the interview situation which may affect the quality of the data.

Reactive, non-reactive research, 21Aug2023

Experiments and surveys research are both **reactive**; that is, the people being studied are aware of the fact that they are being studied.

In **non-reactive research**, those being studied are not aware that they are part of a research project. Such a research is largely based on positivistic principles but is also used by interpretive and critical researchers.

2. Ahmad Adopt Entrepreneurial characteristics of students at standard Annual.
(Kuch asa question tha) What are the purpose and time dimension which Ahmad Adopt here.

- ✓ Statement given the or btana tha. Kon si probability sampling hai **Snowball answer tha** (Statements nai yad kafi bri the).
- ✓ Probability or non probability sampling zrrur smjhy **Repeat**
- ✓ Do you prefer human Interactive medium or Electronic Interactive media describe with Arguments. Long

Ans:-

Human Interactive Media and Electronic Interactive Media ^{21Aug2023} When two people engage in conversation, human interaction takes place. **Human interactive media** are personal forms of communication. One human being directs a message to and interacts with another individual (or a small group). When they think of interviewing, most people envision this type of face-to- face dialogue or a conversation on telephone.

Electronic interactive media allows researchers to reach a large audience, to personalize individual messages and to interact with members of the audience using digital technology. To a large extent electronic interactive media users are controlled by the users themselves. In the context of surveys, respondents are not passive audience members. They are actively involved in a two-way communication when electronic interactive media are utilized.

The Internet, the medium that is radically altering many organizations' research strategies, provides a prominent example of the new electronic interactive media.

Non-Interactive Media: The traditional questionnaire received by mail and completed by the respondent does not allow a dialogue or exchange of information for immediate feedback. Self-administered questionnaires printed on paper are also non-interactive.

- ✓ Describe the sectional bias with three solid Arguments.
- ✓ Statment given the long question mai btana tha kon si sampling hai. Probability hai ya non probability.
- ✓ Focus group discussion ka question ...

1 Long tha k 1 researcher kisi organization k logon sa interview krna chahta hai to woh kon sa method use kra GA. Repeat

Cover letter k kiya faida hai or yeah kesa effect krta hai response rate ko.

Ans:-

Cover Letter 21Aug2023

The cover letter that accompanies the questionnaire or is printed on the first page of the questionnaire is an important means of inducing a reader to complete and return the questionnaire. In the letter tell why the study is important, who is sponsoring the study, how was the respondent selected, assuring the anonymity of the respondent could help in establishing rapport and motivating the respondent to respond.

A personalized letter addressed to a specific individual shows the respondent that he or she is important. Including an individually typed letter on letterhead versus printed form is an important element in increasing the response rate in mail surveys.

Bivariate k 2,3 mcqs tha easy tha

Internal or external validity sa related koi question tha statement wla ab yaad nhi. 3marks

Over all paper as such tough nhi tha just clear your concepts .or ratta to is paper ma nhi chl sakta

Central Location Interviewing

23Aug2023

Research agencies and interviewing services typically conduct all telephone interviews from central location. WATS (Wide-Area Telecommunications Service) lines, provided by long distance telephone service at fixed rates, allow interviewers to make unlimited telephone calls throughout the entire country or within a specific geographic area. Such central location interviewing allows firms to hire staffs of professional interviewers and to supervise and control the quality of interviewing more effectively. When telephone interviews are centralized and computerized, the research becomes even more cost-effective.

Limitations of Historical contemporary research Repeat

Pilot testing Repeat

Telephone assisted internet survey benefits

Ans:-

THE STRENGTHS OF TELEPHONE INTERVIEWING: 25Aug2023

1. High Speed: The speed of data collection is a major advantage of telephone interviewing.

2. Saves Cost: It is estimated the cost of telephone interviewing is less than 25% of the door to door personal interviews.

3. Callbacks: An unanswered call, a busy signal, or a respondent who is not at home requires a callback. Telephone callbacks are substantially easier and less expensive than personal interview callbacks.

4. Can Use Computerized Random Digit Dialing.

5. Expanded Geographic Area Coverage without Increasing the Cost.

6. Uses fewer but highly Skilled Interviewers.

7. Reduced Interviewer Bias

8. Better Access to hard-to-reach respondents through repeated callbacks:

9. Use Computer Assisted Telephone Interviewing (CATI): Responses can be directly entered into computer file to reduce error and cost.

Solomon Four group design

Ans:-

Solomon's Four Group Design: To gain more confidence in internal validity in experimental designs, it is advisable to set up two experimental groups and two control groups. One experimental group and one control group can be given the both pretest and the posttest. The other two groups will be given only the posttest.

Solomon's Four Group Design: To gain more confidence in internal validity in experimental designs, it is advisable to set up two experimental groups and two control groups. One experimental group and one control group can be given the both pretest and the posttest. The other two groups will be given only the posttest.

My Today Paper: Sta630

Timing: 4:00 28aug2023

(Mcqs mostly from 253 pages file)

+Some questions are also from Muhammad Imran file)

1) three advantage of survey internet? 3

Ans:-

ADVANTAGES OF INTERNET SURVEYS: 28Aug2023

1. Speed and Cost Effectiveness:

2. Visual Appeal and Interactivity: Surveys conducted on Internet can be interactive. Many of this interactive survey utilize color, sound, and animation, which may help to increase the respondents' cooperation and willingness to spend more time answering questions. The Internet is an excellent medium for the presentation of visual materials, such as photographs or drawings of product prototypes, advertisements, and movie trailers.

3. Respondent Participation and Cooperation: Participation in some Internet surveys occurs because computer users intentionally navigate to a particular Web site where questions are displayed.

4. Accurate Real-Time Data Capture: The computer to computer nature of Internet surveys means that each respondent's answers are entered directly into the researcher's computer as soon as the questionnaire is submitted. A researcher can review up-to-the-minute sample size counts and tabulation data from an Internet survey in real time.

5. Callbacks: When the sample for Internet survey is drawn from a consumer panel, it is easy to re contact those who have not yet completed the questionnaire. Computer software can also identify the passwords of those respondents who completed only a portion of the questionnaire and send those people customized messages.

6. Personalized and Flexible Questioning: There is no interviewer in Internet surveys but the respondent interacts directly with the software on a Web site. In other words the computer program asks questions in sequence determined by a respondent's previous answer. The questions appear on the computer screen and answers are recorded by simply pressing a key clicking an icon, thus immediately entering the data into the computer's memory. This ability to sequence the question based on previous responses is a major advantage of computer-assisted surveys.

7. Respondent Anonymity **بی نامی**: Respondents are more likely to provide sensitive information when they can remain anonymous. The Anonymity **بی نامی** of the Internet encourages respondents to provide honest answers to sensitive questions. Most respondents do not feel threatening to enter information into the compute because of the absence of the interviewer. They may be assured that no human will ever see their individual responses.

8. Response Rate: Response rate can be increased by sending e-mail friendly reminders.

2) What sample used rather than whole population? 3 Repeat

3) What are major ethical delimmas ? 3

4) Disadvantages of content analysis? 5 Repeat

5) Give suggestions recording accurately interview? 5

6) Is it possible to use cause and effect relationship by using one shot case study design ?

Justification 5 Repeat

7) Why unit of analysis is important during data collection explain with example? 5 Repeat

1. Researcher has choice whether to opt for probability Or non probability sampling technique. In which situation non probability is preferred over probability sampling technique? Enliste any two?

Ans:- Non-probability sampling techniques are often preferred in situations where it's difficult to create a representative sample of the entire population. Two situations where non-probability sampling might be preferred are:

- 1..Limited Resources
- 2..Hard-reach population

2. How telephonic interviews reduce interviewers influence a biasness? Example

Ans:-

- How telephonic interviews reduce interviewers influence a biasness?
Example very shortly

Telephonic interviews can reduce interviewer bias by eliminating visual cues like appearance and body language that might unconsciously influence decisions. For example, when a candidate's qualifications and responses are the primary focus, rather than their appearance or mannerisms, it helps ensure a fairer evaluation.

3. The validity of experiment is measured by two methods internal validity and external validity. What do you understand by internal validity of experiment and external validity of experiment? **Repeat**
4. Probing in an interview helps the researcher to get the detailed answers. What are different tactics can use to probe the respondents.. short **Repeat**
5. Explain the importance of statistical software (like MINITAB and SPSS etc) . for data presentation in research. Explain with the help of examples? Long

Ans:-

1- Explain importance of statistical software (MINITAB and SPSS) in data presentation. Give examples 28Aug2023

The proliferation of computer technology in business and universities has greatly facilitated tabulation and statistical analysis. Commercial packages eliminate the need to write a new program every time you want to tabulate and analyze data with a computer. SAS, Statistical Package for the Social Sciences (**SPSS**), SYSTAT, Epi, Info, and **MINITAB** is commonly used statistical packages. These user friendly packages emphasize statistical calculations and hypothesis testing for varied types of data. They also provide programs for entering and editing data. Most of these packages contain sizeable arrays of programs for descriptive analysis and univariate, bivariate, and multivariate statistical analysis.

disadvantages of content analysis

Disadvantages

1. **Bias:** Many documents used in research were not originally intended for research purposes. The various goals and purposes for which documents are written can bias them in various ways. For example, personal documents such as confessional articles or autobiographies are often written by famous people or people who had some unusual experience such as having been a witness to a specific event. While often providing a unique and valuable research data, these documents usually are written for the purpose of making money. Thus they tend to exaggerate and even fabricate to make good story. They also tend to include those events that make the author look good and exclude those that cast him or her in a negative light.
2. **Selective survival:** Since documents are usually written on paper, they do not withstand the elements well unless care is taken to preserve them. Thus while documents written by famous people are likely to be preserved, day-to-day documents such as letters and diaries written by common people tend either to be destroyed or to be placed in storage and thus become inaccessible. It is relatively rare for common documents that are not about some events of immediate interest to the researcher (e.g., suicide) and not about famous occurrence or by some famous person to be gathered together in a public repository that is accessible to researchers.
3. **Incompleteness:** Many documents provide incomplete account to the researcher who has had no prior experience with or knowledge of the events or behavior discussed. A problem with many personal documents such as letters and diaries is that they were not written for research purposes but were designed to be private or even secret. Both these kinds of documents often assume specific knowledge that researcher unfamiliar with certain events will not possess. Diaries are probably the worst in this respect, since they are usually written to be read only by the author and can consist more of "soul searching" and confession than of description. Letters tend to be little more complete, since they are addressed to a second person. Since many letters assume a great amount of prior information on the part of the reader.
4. **Lack of availability of documents:** In addition to the bias, incompleteness, and selective survival of documents, there are many areas of study for which no documents are available. In many cases information simply was never recorded. In other cases it was recorded, but the documents remain secret or classified, or have been destroyed.
5. **Sampling bias:** One of the problems of bias occurs because persons of lower educational or income levels are less likely to be represented in the sampling frames. The problem of sampling bias by educational level is more acute for document study than for survey research. It is a safe generalization that a poorly educated people are much less likely than well educated people to write documents.
6. **Limited to verbal behavior:** By definition, documents provide information only about respondent's verbal behavior, and provide no direct information on the respondent's nonverbal behavior, either that of the document's author or other characters in the document.
7. **Lack of standardized format:** Documents differ quite widely in regard to their standardization of format. Some documents such as newspapers appear frequently in a standard format. Large dailies always contain such standard components as editorial page, business page, sports page, and weather report. Standardization facilitates comparison across time for the same newspapers and comparison across different newspapers at one point in time. However, many other documents, particularly personal documents have no standard format. Comparison is difficult or impossible, since valuable information contained in the document at one point in time may be entirely lacking in an earlier or later documents.
8. **Coding difficulties:** For a number of reasons, including differences in purpose for which the documents were written, differences in content or subject matter, lack of standardization, and differences in length and format, coding is one of the most difficult tasks facing the content analyst. Documents are generally written arrangements, rather than numbers are quite difficult to quantify. Thus analysis of documents is similar to analysis of open-ended survey questions.
9. **Data must be adjusted for comparability over time:** Although one of the advantages of document study is that comparisons may be made over a long period of time, since external events cause changes so drastic that even if a common unit of measure is used for the entire period, the value of this unit may have changed so much over time that comparisons are misleading unless corrections are made. Look at the change in measuring distance, temperature, currency, and even literacy in Pakistan.

6. Miss hira wanted to conduct telephonic interviews but considering the weakness of this technique, she decide to take personal interviews of respondent's.as a researcher in Which situation will you avoid using telephonic interview? Short **Repeat**

Paper#21

Sta630 28Aug2023

Mcqs were quite difficult some from file 253 pages

1. Survey and field research
2. Why for experimental design randomization

or random sampling preferred?

Survey and field research

Survey and field research are two methods used to gather data for studies. Surveys involve collecting information from a large number of participants through structured questionnaires, helping researchers quantify trends or opinions. Field research involves direct observation and data collection in real-world settings, often providing more in-depth insights into behaviors and interactions. Both methods have their strengths and weaknesses, and the choice depends on the research goals and context.

Why for experimental design randomization or random sampling preferred?define shortly

Randomization and random sampling are preferred in experimental design because they reduce bias, ensure representative samples, control variables, enhance statistical validity, improve external validity, and uphold ethical standards.

3. The key difference between survey interview and field interview discuss and example?

4. During interviewing necessary key points

- During interviewing necessary key points define shortly

During interviews, necessary key points include clear communication, active listening, asking open-ended questions, probing for deeper insights, staying focused on the topic, maintaining a comfortable atmosphere, and summarizing key takeaways.

5. Ek long question tha statement bht lengthy thi Or end p tha identify target population and sampling frame **Repeat**
