

Lesson: 19-20

Maslow's Theory

● Biographical Sketch of Abraham Maslow:

- Born April 1, 1908, in Brooklyn, New York, to Russian Jewish immigrant parents.
- Initially influenced by behaviourism but shifted focus to humanistic psychology after observing his own children.
- President of the American Psychological Association (1967–1968).
- Founding editor of the Journal of Humanistic Psychology and Journal of Transpersonal Psychology.

● Basic concepts of Humanistic Psychology:

1. **Integrated Whole:** Individuals must be studied as unified wholes, not in fragmented behaviours.
2. **Irrelevance of Animal Research:** Human behaviour is unique and cannot be fully understood by studying animals.
3. **Man's Inner Nature:** People are inherently good; destructive behaviours stem from bad environments.
4. **Human Creativity:** Creativity is universal, found in everyday self-expression, not just in art or writing.
5. **Emphasis on Psychological Health:** Focus on studying healthy individuals rather than only neurotic or psychotic behaviours.

● Maslow's Hierarchy of Needs:

1. **Physiological Needs:** Basic survival needs like food, water, and shelter.
2. **Safety Needs:** Security, stability, and freedom from fear.
3. **Belongingness and Love Needs:** Relationships, friendships, and social connections.
4. **Self-Esteem Needs:** Respect, recognition, and personal achievement.
5. **Self-Actualization:** Fulfilment of potential and becoming the best version of oneself.

● Self-Actualizers' Characteristics:

1. Efficient perception of reality.
2. Acceptance of self, others, and nature.

3. Spontaneity, simplicity, and naturalness.
4. Problem-centered focus with a sense of mission.
5. Need for privacy and detachment.
6. Autonomy and independence.
7. Continued appreciation of life experiences.
8. Peak or mystical experiences of joy and connection.
9. Deep social interest and compassion.
10. Close interpersonal relationships.
11. Democratic character structure, free from prejudice.
12. Clear ethical and moral standards.
13. Philosophical sense of humour.

Goal of psychotherapy:

- Any means of any kind that can help to restore the person to path of self actualization and
- Development along the lines that his inner nature dictates.

Meta-Motivational Theory:

- Differentiates between basic needs (hunger, security) and meta-needs (justice, beauty).
- Meta-needs are instinctual but do not follow a hierarchy.

Empirical Validation:

- Research has focused on validating the hierarchy of needs and self-actualization concepts.
- Other aspects of Maslow's theory lack strong empirical support.

Lesson: 21-23

ROGER'S PERSON CENTERED APPROACH

Phenomenological Theory of Personality:

- Focus on subjective experiences, feelings, and personal views.
- Behaviour depends on individual perceptions and interpretations of the world.
- Emphasis on the self, making it a self-theory of personality.

● **Biographical Sketch:**

- Carl Ransom Rogers (1902–1987) was born in Oak Park, Illinois.
- Authored influential books on counselling, personality, and education.
- Recognized as one of the most influential American psychologists.

Human Nature Perspective:

- Rogers viewed humans as constructive, forward-moving, and trustworthy.
- Believed people are self-directed and goal-oriented rather than controlled by external forces.
- Critiqued negative views of humanity, such as Christianity's concept of innate sinfulness and Freud's emphasis on destructive impulses.

Positive View of Humanity:

- Fully functioning individuals are positive, rational, and capable of harmony.
- Human nature tends toward differentiation, responsibility, cooperation, and maturity.
- Expressing one's natural tendencies enhances both individual and species well-being.

● **Actualizing Tendency:**

- A universal, biological motive driving behaviour, rooted in physiological processes.
- Maintains the organism by fulfilling basic needs and enhances growth, differentiation, and regeneration.
- Encourages autonomy, self-reliance, creativity, and expansion of experiences.
- Common to all forms of life, representing the essence of life itself.

● **Rogers' Phenomenological Position:**

- Reality is based on an individual's internal frame of reference and subjective world.
- Perceptions and experiences shape a person's reality and actions.
- Behaviour is understood by observing a person's subjective experiences.
- Rogers emphasizes a holistic approach, viewing behaviour as integrated and inseparable.

● **Concept of Self: Who am I anyway:**

- **Self-Concept:** Central to Rogers' theory, representing conscious perceptions and values of the "I" or "me."
- **Awareness:** Includes awareness of being (what I am) and awareness of function (what I can do).
- **Ideal Self:** The image of the person one aspires to be, similar to Freud's concept of the superego.
- **Organismic Valuing Process:** Guides the development of the self, where experiences are evaluated based on their impact on the actualizing tendency.
- **Infant Evaluation:** Early experiences are evaluated naturally based on their pleasure or discomfort and their effect on biological well-being.

● **Need for positive regard:**

- All individuals have a basic desire for warmth, respect, love, and acceptance from significant people in their lives.
- This need for positive regard emerges as self-awareness develops and is persistent throughout life.
- It is initially seen in the infant's need for love and care and continues as a need for approval from others.
- Positive regard can be learned or innately given, with Rogers preferring the learned explanation.

● **Conditions of Worth:**

- Children are influenced by attitudes and approval from others.
- Conditional positive regard is shown when approval is given based on meeting certain standards.
- Rogers argues that such conditions are harmful to the development of a fully functioning person.
- The child focuses on meeting external standards instead of understanding their own true desires and identity.

- This results in self-evaluation based on actions that received approval, not the child's true self.

● **Unconditional Positive Regard:**

- Acceptance and respect for a person without any conditions, irrespective of their behaviour or attributes.
- A mother's love illustrates unconditional positive regard, loving the child for who they are, not for meeting specific expectations.
- Rogers promotes unconditional positive regard while maintaining discipline and behavioural control.
- Children should be valued and loved as unique human beings.
- When children feel equally worthy of positive regard regardless of their experiences, they develop unconditional self-regard.

● **Experience of Threat and the Process of Defence:**

- Threat arises when there is a conflict between self-concept and actual experience.
- Anxiety signals danger to the self-structure when such conflicts approach awareness.
- Defence aims to maintain the current self-concept by distorting or denying experiences.
- Defence mechanisms include perceptual distortion and rationalization, e.g., blaming external factors for a poor exam grade.

● **The Fully Functioning Person:**

- Openness to Experience: Fully aware of feelings without defensiveness, able to accept and admit emotions.
- Existential Living: Living fully in the moment, perceiving each moment as new and unpredictable.
- Organismic Trusting: Relying on inner instincts and personal judgment rather than external norms or opinions.
- Experiential Freedom: Feeling free to shape life responsibly, despite biological or social influences.

- **Creativity:** Producing creative ideas, actions, and engaging in creative living.

● **Rogers' View of Science and Research:**

- Strong commitment to phenomenology for understanding human experiences.
- Phenomenology focuses on studying the essence of subjective experiences.
- Aims to explore how individuals understand their world and themselves.

● **Measuring the Self-Concept: The Q Sort:**

- **Q Technique:** Developed by William Stephenson to systematically study self-concept and relationships.
- **Q Sort Method:** Subjects sort cards with personality traits into categories along a continuum, reflecting self-description and ideal self-description.
- **Self-Sort vs. Ideal-Sort:** Self-sort represents the current self-concept, while ideal-sort reflects the desired self-concept.
- **Data Analysis:** Correlation coefficients measure congruence or divergence between self-concept and ideal self-concept.

● **Personality Disorganization and Psychopathology:**

- Occurs when the self fails to defend against threatening experiences.
- Psychotic behaviour reflects denied aspects of experience rather than the self-concept.
- Person-centred therapy aims to restore harmony between the self-concept and total experience.

● **Evolution of Rogerian Therapy (Client Centred Therapy):**

- **Early Phase (Nondirective Therapy):** Focused on creating an atmosphere for clients to solve their problems independently.
- **Client-Centred Therapy:** Therapy became a joint process emphasizing understanding the client's subjective experience.
- **Experiential Phase:** Therapist actively explored the client's internal frame of reference.

- **Person-Centred Therapy:** Focus shifted to the whole person, not just their role as a client or student.

Conditions Necessary for Therapy:

1. Psychological contact between client and therapist.
2. Client experiences incongruence and anxiety.
3. Therapist shows empathetic understanding using the client's perspective.
4. Therapist provides unconditional positive regard.
5. Client perceives the unconditional positive regard.

Observable Changes in Clients:

1. Freedom to express feelings.
2. Accurate descriptions of experiences.
3. Awareness of incongruence between self-concept and experiences.
4. Acceptance of incongruence without distortion or denial.
5. Awareness of previously denied or distorted feelings.
6. Reorganization of self-concept to include denied experiences.
7. Reduced defensiveness toward experiences.
8. Increased self-awareness.
9. Release from conditions of worth.
10. Recognition of the therapist's unconditional positive regard.

● Skinner and Rogers Debate:

- Debate held at the 1955 APA meeting in Chicago.
- Rogers: Advocated human freedom, innate goodness, and self-actualization.
- Skinner: Emphasized behaviour controlled by stimulus-response.
- Agreed on the growth of behavioural science.
- Rogers introduced therapy session recordings for training.

● Psychotherapy and Gardening:

- Rogers compared person-centred therapy to gardening, reflecting his agricultural background.
- Emphasized creating conditions for growth, both in therapy and gardening.

- Gardening involves care, patience, and understanding to nurture plants, mirroring therapeutic practices for personal growth.
- Rogers felt the same satisfaction from a thriving garden as from facilitating growth in individuals or groups.

● **Student-Centred Teaching:**

- Criticized the American education system for treating students as objects and teachers as authority figures.
- Education relies on structured environments with passive information delivery.
- Believes students learn best in non-threatening environments with unconditional positive regard.
- Learning improves when material is personally relevant and significant.
- Teachers should act as facilitators, creating a conducive learning atmosphere.
- Education is based on faulty assumptions, expecting students to absorb large amounts of information without active participation.

● **Summary:**

- Human Nature: Rogers viewed humans as inherently good and driven by an actualizing tendency.
- Self-Concept: Central to personality; shaped by positive regard, conditions of worth, and unconditional positive regard.
- Incongruence: A mismatch between self-concept and experience causes threat and defensiveness.
- Fully Functioning Person: Open, trusting, and self-actualizing individuals.
- Person-Centred Therapy: Focuses on empathy, unconditional positive regard, and client-therapist relationships for change.

● **Evaluation:**

- 1-It is phenomenological and humanistic.
- 2- The focus is on unconditional positive regard.
- 3- Person Centred Therapy.

4-Student Centred Teaching Approach.

- i. Freedom to learn
- ii. Teacher as a Facilitator.

● **Application:**

His theory can be applied to education, marriage and family.

Lesson: 24-25

KELLY'S COGNITIVE THEORY OF PERSONALITY

● **Kelly's Theory is:**

- **Phenomenological:** Focuses on the individual's internal frame of reference.
- **Cognitive:** Studies mental events.
- **Existential:** Emphasizes the future and individual freedom to choose.
- **Humanistic:** Focuses on creativity and optimism about people's ability to solve problems.
- **Personal Constructs:** Behaviour and thinking are guided by constructs to predict future events, channelling processes based on anticipated reality.

● **The Psychology of Personal Construct:**

- **Thinking Animals:** Humans are fundamentally thinking beings, and this affects behaviour.
- **Cognitive Focus:** George Kelly emphasized the cognitive aspects of personality, viewing people as scientists.
- **Psychology of Personal Constructs:** People strive to understand, interpret, anticipate, and control their world to deal effectively with it.
- **Scientist-like Behaviour:** Kelly viewed humans as active "scientists," inferring from the past and hypothesizing about the future, not just passive reactors to stimuli.
- **Innovation in Cognitive Theory:** Kelly's approach greatly influenced modern cognitive personality theory.

● **George Kelly's Biography:**

- **Born:** April 28, 1905, in Perth, Kansas, the only child of religious farm parents.
- **Career:** Became associate professor at Fort Hays Kansas State College, developed traveling psychological clinics, and moved away from Freudian theory.
- **World War II:** Served as a naval aviation psychologist.
- **Later Role:** Appointed associate professor at the University of Maryland in 1945.
- **Leadership:** President of Clinical and Counselling Divisions of the APA and led the American Board of Examiners in Professional Psychology.
- **International Work:** Applied his personal construct theory to international issues during a 1960-1961 world tour.

● **Cornerstones of Cognitive Theory:**

- Personality theories involve assumptions about human nature.
- George Kelly emphasized acknowledging these philosophical assumptions.
 1. **Constructive Alternativism:**
 - Humans create constructs to interpret, predict, and give meaning to their experiences.
 - Constructs are flexible and can be revised or replaced.
 - All views of reality are interpretative and subject to change.
 2. **Humans as Scientists:**
 - Individuals act like scientists by developing hypotheses (constructs) to reduce uncertainty.
 - Constructs allow people to anticipate and control events in their lives.
 - The goals of science—prediction, modification, and understanding—parallel human cognitive processes.
 3. **Cognitive Perspective on Personality:**
 - Focuses on how individuals perceive and interpret their environments.
 - Emphasizes understanding psychological processes to anticipate life events.

● **Personal Construct Theory:**

- Focuses on how individuals perceive and interpret people and things in their environments.
- Constructs are psychological processes that help individuals order and understand life events.

a. Constructs: Templates for Reality:

- Constructs categorize events by identifying similarities and differences.
- People are free to create constructs (constructive alternativism), but once chosen, they are bound to them.
- Constructs act as “templates” or transparent patterns individuals use to interpret their experiences.
- Examples of constructs include “good vs. Bad,” “friendly vs. Hostile,” and “intelligent vs. Stupid.”

b. Formal Properties of Constructs:

- Constructs apply to specific domains; their predictive efficiency weakens if overgeneralized.
- Example: “Good vs. Bad” has a broad range, while “virginity vs. Prostitution” has a narrower scope.
- Constructs are relevant to some events but not to others, limiting their applicability.

c. Types of Constructs:

- “Preemptive” Constructs: Exclusively categorize elements within their realm, disallowing re-evaluation or reinterpretation.
- Examples: Ethnic labels or rigid stereotypes, e.g., “Chicano” or “hard-nosed professor,” restrict broader understanding.
- Preemptive thinking reflects rigid or inflexible cognition, denying fresh perspectives.

● **Personality: The Personologist’s Construct?:**

- Kelly did not explicitly define personality but described it as an abstraction of a person’s activities and relationships.
- Personality is not a separate entity but an observation made by personologists based on psychological processes.

- Personality is inherently tied to a person's interpersonal relationships and interactions.
- Personality equals the construct system an individual uses to interpret experiences and anticipate the future.
- Understanding someone's personality requires knowing their constructs, the events categorized under them, and how these constructs are organized
- To know someone's personality is to understand how they interpret and construe their personal experiences.

● **A Postulate and Some Corollaries:**

- Personal construct theory is based on one main postulate with 11 corollaries.

- **Corollaries:**

- Construction: Constructs arise from recurring themes in experiences.
- Individuality: Constructs are unique to individuals.
- Organization: Constructs are organized differently by each person.
- Dichotomy: Constructs highlight similarities and contrasts.
- Choice: Constructs are chosen to expand the construct system.
- Range: Constructs apply to specific ranges of events.
- Experience: Construct forming, revising, and testing are key.
- Modulation: Some constructs are open (permeable) to new experiences.
- Fragmentation: Trying new constructs may cause inconsistency.
- Commonality: Similar constructs lead to similar thinking.
- Sociality: Roles depend on understanding others' expectations.

● **Channelizing Processes:**

- Human behaviour is guided ("channelized") by how individuals anticipate events, as stated in Kelly's fundamental postulate.

● **Individuality and Organization:**

Individuality Corollary:

- People differ in how they construct and interpret events, highlighting personality uniqueness.
- Personal constructs act as unique "goggles" through which individuals view reality.

Examples of Individuality:

- Differences in opinions among political parties, generations (e.g., “generation gap”), and individuals in hierarchical roles like students and professors.

● **To Construe or Not to Construe:**

- Choice Corollary: Individuals choose the construct pole that enhances understanding and improves the predictive efficiency of their construct system.

● **C-P-C Cycle:**

- Circumspection Phase: The individual considers various constructs and possibilities for a situation.
- Preemption Phase: The individual narrows down the alternatives to those most relevant to the situation.
- Control Phase: The individual chooses a course of action based on the constructs selected, aiming to extend and define their construct system.

● **Change in a Construct System:**

- Change in Construct System: A construct system changes when exposed to novel events that don't fit the current system, leading to revisions.
- Experience Corollary: A person's construct system evolves as they repeatedly interpret events.

● **Social Relationships and Personal Constructs:**

- Similarity in Constructs: People are similar when they construe experiences in the same way, not because of shared events or behaviours.
- Psychological Meaning: Similarity in behaviour arises when events have similar psychological meanings for individuals.

● **Role Construct Repertory Test: Assessing Personal Constructs:**

- Purpose of the Rep Test: Developed to identify key constructs a person uses to perceive significant people in their life, and to assist therapists in understanding a client's construct system.

- **Role Titles:** The test uses role titles (e.g., Self, Mother, Father, Spouse) to evaluate personal constructs and how individuals categorize people they know.
- **Diagnostic Tool:** The test helps in structuring the client's personal and material environment based on how they construe different roles and relationships.

● **Application: Emotional States & Psychological Disorders:**

Emotional States:

- **Anxiety:**

Results from realizing one's constructs are insufficient to interpret new events, leaving the person unable to predict or understand the situation.

- **Guilt:**

Arises when an individual deviates from their self-image or role, leading to a sense of failure in maintaining important relationships.

- **Hostility:**

Occurs when someone persists in using an invalid construct despite contradictory evidence, trying to validate a failed prediction.

Psychological Disorders:

- The focus here is on how emotional states relate to cognitive processes, with disorders emerging when constructs fail to accommodate new experiences.

● **Psychological Health:**

- Healthy individuals actively evaluate their constructs and test their perceptions of others, ensuring their social predictions are accurate.
- They are flexible in updating or discarding invalid constructs, as their system of constructs is permeable, allowing for growth and change.

● **Fixed-Role Therapy:**

- The goal is to reconstruct a client's construct system to make it more workable by encouraging them to test and adapt new constructs.
- Therapy functions like a scientific experiment, where clients try new hypotheses, and the therapist provides feedback to help validate or discard them.

- Fixed-role therapy encourages clients to view themselves differently and act in new ways, aiding them in becoming more effective in their lives.
- It starts with the client writing a third-person sketch of themselves, allowing for objective, non-threatening expression and exploration of new roles.

● **Summary:**

1. **Constructive Alternativism:** Reality is subjective and can be interpreted and modified by individuals.
2. **Man as a Scientist:** People create and test ideas to predict future events.
3. **Constructs:** Patterns (templates) individuals use to interpret experiences, forming their unique personalities.
4. **Construct Properties:** Constructs vary in their usefulness, focus, and flexibility (permeable or impermeable).
5. **Types of Constructs:** Includes preemptive (fixed), tight (precise), and loose (flexible).
6. **Postulate and Corollaries:** Behaviour is guided by how people anticipate events. Explain how constructs work, change, and impact relationships.
7. **Rep Test:** A tool to assess personal constructs, used in studies like schizophrenia research.

● **Evaluation:**

- **Phenomenological:** Studies behaviour holistically.
- **Cognitive:** Focuses on thinking and perception.
- **Existential/Humanistic:** Emphasizes freedom, future focus, and personal meaning.
- **Unique Constructs:** Individuals create systems to handle uncertainty and interpret reality freely.

Lesson: 26-27

GORDON ALLPORT: A TRAIT THEORY OF PERSONALITY

● **Traits and Allport's Theory:**

1. Definition of Trait:

- A trait is a predisposition to respond consistently to various stimuli.
- Represents enduring features of behaviour, known as “generalized action tendencies.”

2. Characteristics of Traits:

- Traits have actual existence, not just names.
- They are broader than habits.
- They are dynamic, influencing behaviour.
- Their existence can be proven empirically.

3. Individual Differences:

- No two individuals respond identically to the same stimulus due to unique traits.

4. Gordon Allport's Perspective:

- Focuses on understanding individual uniqueness.

Emphasizes how cognitive and motivational processes shape behaviour.

- Blends humanistic (growth and self-realization) and personalistic (studying the individual) approaches.

5. Allport's Eclectic Approach:

- Integrates ideas from philosophy, religion, sociology, and literature to understand personality.
- Highlights that behaviour stems from unique configurations of personal traits.

● **Biographical Sketch:**

- Early Life: Born in 1897; father a physician, mother a teacher, brother Floyd a psychologist.
- Education: Studied at Harvard; started with low grades but graduated with straight As.
- Traits: Socially isolated, skilled in language, poor at sports, described as having “swallowed a dictionary.”
- Freud Meeting: Uncomfortable silence during their meeting in Vienna.
- Career: Earned Ph.D. in psychology at 24; taught at Dartmouth and later Harvard.

- **Major Works:** Personality (1937), The Psychology of Rumor (1947), The Individual and His Religion (1950), The Nature of Prejudice (1954).

● **What is personality?**

- Personality is “what a man really is” and something that lies behind acts within the individual.
- Defined as a dynamic organization of psychophysical systems determining characteristic behaviour and thought.
- Personality is ever-changing, combining body and mind, and actively influences actions and thoughts.
- Studied through unique behaviours and thoughts.
- Character evaluates moral or ethical qualities and is an ethical concept.
- Temperament refers to the emotional or mood-based component of personality.
- Type describes common traits, e.g., “Aggressive Type.”
- In 1961, Allport revised his definition to emphasize “characteristic behaviour and thought” instead of “unique adjustments to the environment.”

● **Criteria for Adequate Personality Theory:**

- **Personality Within the Individual:** A theory must regard personality as contained within the individual, not merely defined by social roles or relationships.
- **Well-Stocked Organism:** It should assume the organism is “well-stocked” with inherent traits, rejecting the idea of an “empty” organism shaped solely by the environment.
- **Present Motivation:** Motivation should be understood in terms of present structure and function, not just as an outcome of past experiences.
- **Living Synthesis:** Units of analysis must allow for “living synthesis,” breaking down personality into definable parts while maintaining its dynamic, holistic nature.
- **Self-Consciousness:** A theory must account for self-consciousness as an essential aspect of personality without solely relying on it.

● **Allport's Concept of Traits:**

- **Definition of Trait:** A trait is a predisposition to respond similarly to various types of stimuli. It makes many different stimuli or responses functionally equivalent in terms of the trait.
- **Generalized and Enduring:** Traits are broad, enduring, and not linked to specific stimuli or responses. They help maintain consistency in behaviour across various situations.
- **Active Role of Traits:** Traits do not lie dormant but can be actively expressed. For example, a sociable person not only responds charmingly in social situations but also seeks out social interaction.

● **Kinds of Traits:**

- **Real Existence:** Traits are real and vital components of a person's existence, not fictional.
- **Generalized Beyond Habit:** Traits are broader than habits and apply across various situations, whereas habits are more specific and limited.
- **Dynamic in Behaviour:** Traits determine behaviour, driving actions rather than simply responding to external stimuli.
- **Empirically Verifiable:** Traits can be scientifically proven, even if they cannot be directly observed.
- **Relatively Independent:** Traits are interconnected, with no rigid boundaries between them, forming a network of overlapping traits.

● **Types of Traits:**

1. Cardinal Traits:

- Highly pervasive traits that influence almost all of a person's activities.
- Very few people possess cardinal traits.
- Examples: Chauvinism, Machiavellian, Scrooge, or Joan of Arc.

2. Central Traits:

- Generalized but less pervasive traits, the building blocks of personality.
- Traits that are often expressed and easily noticed by others.
- Examples: Outgoing, sociable, attentive, vivacious.

3. Secondary Traits:

- Less noticeable, less consistent traits, often situation-dependent.
- Examples: Food preferences, attitudes toward specific situations.

Common vs. Individual Traits

- **Common Traits:** Generalized traits shared within a culture, like assertiveness or politeness.
- **Individual Traits:** Unique to a person and not widely shared.

● The Proprium: A Real Self:

1. **The Sense of Bodily Self:** Lifelong awareness of one's own body and sensations as the foundation of self-awareness.
2. **The Sense of Self-Identity:** Recognition of oneself as unique and constant, aided by language and personal belongings.
3. **The Sense of Self-Esteem or Pride:** Self-evaluation, seen in early independence and later in competitive behaviour.
4. **The Sense of Self-Extension:** Perception of external objects and relationships (e.g., possessions, family) as part of oneself.
5. **The Self-Image:** Awareness of how others perceive "me," linked to early understanding of expectations and behaviour.
6. **The Sense of Self as a Rational Coper:** Between ages 6-12, realization of the ability to think rationally and solve problems independently.
7. **Propriate Striving:** In adolescence, pursuit of long-term goals, with a focus on purpose and future planning.

● Functional Autonomy: The Past is Past:

- **Contemporaneity of Motives:** Current motives, not past events, drive behaviour. The focus is on the present state of the individual.
- **Pluralistic Theory of Motivation:** Motivation is diverse and cannot be reduced to a single concept (e.g., drives or unconscious forces).
- **Dynamic Force of Cognitive Processes:** Long-term goals, plans, and future aspirations are central to understanding motivation.
- **Uniqueness of Motives:** Motives function uniquely in each individual, highlighting personal distinctiveness.
- **Propriate Functional Autonomy:** Involves acquired interests, values, and intentions that integrate and drive adult personality.

- **Significance of Propriate Autonomy:** Encourages striving for a congruent self-image, maturity, and personal growth without constant reinforcement.

● **Application: The Study of Values:**

1. **The Theoretical:** Values truth and pursues knowledge through observation and reasoning, focusing on fundamental identities and differences.
2. **The Economic:** Prioritizes usefulness, practicality, and material wealth, with interests rooted in business and self-preservation.
3. **The Aesthetic:** Focuses on form, harmony, and artistic experiences, valuing beauty and grace in life events.
4. **The Social:** Emphasizes love for people, altruism, and unselfishness, viewing human connection as the highest value.
5. **The Political:** Values power, leadership, and influence, seeing competition and control as central to life's purpose.
6. **The Religious:** Seeks unity and higher meaning, either through active participation in life (immanent mystics) or withdrawal from it (transcendental mystics).

● **Summary:**

- **Traits:** Allport defined traits as consistent behavioral patterns, categorized as cardinal, central, or secondary.
- **Proprium:** The “self-as-known” unifies traits and guides personality development.
- **Functional Autonomy:** Adult motives are independent of childhood origins, divided into preservative and Propriate autonomy.
- **Study of Values:** A test measuring six value types (theoretical, economic, aesthetic, social, political, religious).

● **Evaluation:**

- Opposed psychoanalytic and behavioural views of personality.
- Limited research supports trait theory, but Allport made notable contributions.

FACTOR ANALYTIC TRAIT THEORY

(Raymond Cattell)

● Factory Analysis:

1. **Factor Analysis:** A statistical method used to identify traits (factors) based on correlations between variables.
2. **Correlation:** Measures the relationship between variables, expressed by a correlation coefficient ranging from +1 (strong positive) to -1 (strong negative).
3. **Data Types:**
 - **L-Data:** Life record data (observed behaviors).
 - **Q-Data:** Questionnaire data (self-reports).
 - **T-Data:** Test data (objective tests).
4. **Procedure:**
 - Measure individuals in diverse ways.
 - Create a correlation matrix from inter-correlations.
 - Identify clusters of correlations (factors/traits) as building blocks of personality.

● Biographical Sketch:

- **Born:** 1905 in Staffordshire, England.
- **Childhood:** Enjoyed outdoor activities like exploring, swimming, and sailing.
- **World War I Impact:** Witnessed wounded soldiers, influencing his perspective on life.
- **Education:** Studied psychology at the University of London (Master's and Ph.D.).
- **Academic Positions:** Professor at Clark University (1938-1941). Joined the University of Illinois in 1945 as Research Professor and Lab Director.
- **Awards:** Received New York Academy of Science Prize in 1953.
- **Research Focus:** Genetic research (Darwin Fellowship).

● The Nature of Personality: A Structure of Traits:

- Cattell's theory is one of the most complex and focuses on traits, which are "mental structures" inferred from behaviour to explain consistency.

Traits:

- Traits are fundamental to Cattell's theory and are used to explain regularity in behaviour.
- Traits can be divided into unique traits (individual-specific) and common traits (shared by everyone in a community).

1. R-Technique and P-Technique:

- **R-Technique**: Factor analysis used to measure traits across many individuals.
- **P-Technique**: Factor analysis used to measure traits within the same individual over time.

2. Surface Traits:

- Surface traits are clusters of observable behaviours or overt variables that seem to go together.
- These are less stable than source traits and correspond to generalizations based on simple observation.

3. Source Traits:

- Source traits are underlying factors that determine multiple surface traits.
- Identified through factor analysis, these traits are more stable and useful in accounting for behaviour.

4. Constitutional Traits and

5. Environmental Traits:

- Source traits can be constitutional (genetically determined) or environmental mold traits (shaped by cultural influences).

6. Ability Traits

- Determine how well a task is performed, including fluid intelligence (genetically determined) and crystallized intelligence (learned).

7. Temperament Traits:

- Constitutional traits that determine emotional makeup.

8. Dynamic Traits:

- Traits that set the person in motion toward goals. They include:
- Ergs: Biological drives or instincts.
- Meta-Ergs: Learned drives, which include sentiments (predispositions to act toward objects or events) and attitudes (specific responses to events).

Dynamic Lattice:

- The dynamic lattice explains the relationship between ergs, sentiments, and attitudes, where sentiments are subsidiary to ergs and attitudes are subsidiary to sentiments.

● Important Dynamic Traits:

- Cattell's dynamic traits include attitudes, ergs, and sentiments, each playing a vital role in personality structure and functioning.

1. Attitudes:

- An attitude is an individual's response to a situation or object.
- It reflects intensity (e.g., "want very much") towards a course of action (e.g., "to marry") and an object (e.g., "a woman").
- Measurement of attitude strength involves various methods, including physiological responses and cognitive tests.
- Cattell identified two components: conscious and integrated aspects, and less conscious or unconscious aspects. These components contribute to the overall attitude score.

2. Ergs:

- Ergs correspond to biologically based drives or instincts that motivate behaviour.

3. Sentiments (The Self):

- Sentiments are acquired attitude structures.
- The self is a critical sentiment that influences most attitudes and is linked to the expression of other ergs and sentiments.
- The self sentiment plays a key role in personality integration, interrelating various drives and emotional states.

● Major Sources of Data about Personality:

- Cattell identified three main sources of data for studying personality:

I. L-Data (Life Record):

- Involves actual behaviour records, such as school or court records.
- Often substituted with ratings from people who know the individual in real-life contexts.

II. Q-Data (Self-Rating Questionnaire):

- Involves the person's own reports about their behaviour, providing insights into their "mental interior."

III. T-Data (Objective Test):

- Based on creating specific situations where a person's behaviour can be objectively measured.
- Includes pencil-and-paper tasks or apparatus-based assessments.
- Cattell and his team developed over 400 such tests.
- Cattell used factor analysis with all three data sources to identify consistent traits, concluding that similar traits appeared across life records and questionnaires, but different traits emerged from objective tests.
- These studies involved diverse age groups and countries, suggesting general applicability.

The Specification Equation:

- Cattell defined personality as what allows for the prediction of how a person will behave in a given situation.
- His formula for predicting behaviour is:

$$\bullet R = f(P, S)$$

R = Person's reaction

f = Function (relationship)

P = Person's personality

S = Situation

- This suggests that behaviour is a function of both personality and the situation.
- Cattell further refined this with the Specification Equation, which accounts for various traits and their influence on behaviour in a particular situation:

$$\bullet P_j = s_{ja}A + s_{jt}T + s_{je}E + s_{jm}M + s_{jr}R + s_{js}S$$

Where:

P_j = Performance in a situation

A = Ability traits

T = Temperament traits

E = Ergic tensions (biological drives)

M = Meta-ergo traits (sentiments and attitudes)

R = Temporary body states (e.g., fatigue, illness)

S_j = Weight or loading, indicating the importance of each trait in the situation.

- To predict how a person will react to a situation, all relevant traits are listed and weighted based on their significance for that specific situation.
- For example, intelligence would carry more weight in a problem-solving scenario than other traits.

● **The Development of Personality:**

- Result of motivation and learning; motivation drives changes in perceptual and behavioural capacities.

• ***Types of Learning in Personality Development:***

- I. ***Classical (Respondent) Conditioning:*** Attaching emotional responses to environmental cues.
 - II. ***Instrumental (Operant) Conditioning:*** Establishing means to satisfy ergic goals, significant in forming the dynamic lattice.
 - III. ***Structured (Integration) Learning:*** Elaborate form of instrumental learning, where the individual maximizes long-term satisfaction by managing ergs.
- ***Confluence Learning:*** A type of instrumental conditioning where behaviour/attitude satisfies multiple goals, linking attitudes to sentiments and sentiments to ergs.
 - ***Integration Learning:*** Key to forming self and superego sentiments, involving the expression and suppression of ergs to achieve long-term satisfaction.
 - ***Personality Learning:*** Described as multidimensional changes in response to experience and situations, studied through adjustment path analysis (examining trait changes and possible adjustment paths).

● **Heredity-Environment Analysis:**

- ***MAVA (Multiple Abstract Variance Analysis):*** Method developed by Cattell to assess the genetic and environmental influences on source traits by studying twin and sibling resemblances in different environments.

● Research Methods:

1. *Factor-Analytic Study of a Single Individual:*

- ***R-technique:*** Factor analysis of multiple people to find common traits.
- ***P-technique:*** Factor analysis of multiple measurements on a single individual to identify unique traits.

2. *Surface vs. Source Traits:*

- ***Surface Traits:*** Measured traits expressed in overt behavior.
- ***Source Traits:*** Underlying causes of behavior, about 16 source traits.

3. *Ability Traits:*

- Fluid intelligence (genetically determined, problem-solving ability).
- Crystallized intelligence (learned knowledge through experience).

4. *16 Personality Factors (16 PF):*

- Developed by Cattell, a test used to predict vocational and academic success.

● Summary:

- ***Cattell's Personality Approach:*** Uses factor analysis on large groups to identify common traits.
- ***Common vs. Personal Traits:*** Cattell focuses on common traits (shared by individuals) rather than personal traits (unique to each individual).
- ***Source Traits:*** Divided into constitutional (genetically determined) and environmental mold traits (shaped by culture).
- ***Types of Traits:***
 - ***Ability Traits:*** Intelligence.
 - ***Temperament Traits:*** Emotional makeup.
 - ***Dynamic Traits:*** Motivational traits; divided into ergs (biological drives) and meta-ergs (learned drives, sentiments, and attitudes).
- ***Personality Development:*** Explained through classical and instrumental conditioning and structured learning, particularly the latter for overall personality changes.
- ***Dynamic Crossroads:*** Points where behavior is directed to satisfy ergic tensions.

● **Evaluation:**

- **Positive Aspects:** Cattell's scientific approach to quantifying personality through factor analysis is valued for its rigor and clarity.
- **Negative Aspects:** Some critics, like Allport, argue that Cattell's focus on average traits and groups over individuals obscures the uniqueness of personality.

Lesson: 30-31

HENRY MURRAY'S PERSONOLOGY

- Personology is used to understand an individual in full complexity.
- Murray's definition of personality focuses on abstraction, lifespan events, and enduring behavior patterns.
- Personality is located in the brain and functions to reduce conflicts, satisfy needs, and plan future goals.

● **Biographical Sketch:**

- Murray was born in 1893 in New York and studied biochemistry at Harvard.
- He shifted to psychology after reading Jung's Psychological Types and meeting Christiana Morgan.
- Died in 1988 at age 95.

● **Definition of Personality:**

- Murray provided various definitions over time, focusing on the history of the person, the abstract nature of personality, and physiological processes.

1. Proceedings and Serials:

- **Proceedings:** Interactions between subjects and objects or between subjects themselves, involving significant behavioural sequences.
- **Serials:** Long-term behaviours or life events, such as a career or marriage.

2. Serial Programs and Schedules:

- **Serial Programs:** Sub-goals arranged to achieve a long-term goal (e.g., becoming a doctor).

- **Schedules:** Devices to reduce conflict among competing needs, allowing for the efficient achievement of goals.

3. Ability and Achievement:

- Murray emphasized ability, achievements, and leadership in understanding personality.
- Unconscious forces and childhood events shape behavior.
- A later focus on creativity and imagination for psychological health.

4. The Dynamics of Personality:

- Focus on motivational psychology, with a focus on directional tendencies in mental, verbal, or physical activities.
- Motivational processes are key to understanding human behavior, with particular attention to needs, tensions, and achieving goals.

● Need:

- A need is a force in the brain that organizes perception and behavior to change an unsatisfying situation.
- Needs are provoked by internal processes or environmental forces (presses).
- Each need is accompanied by a particular emotion and leads to actions that satisfy the need.

● Types of Needs:

1. Primary and Secondary Needs:

- **Primary:** Linked to physical events (e.g., food, sex).
- **Secondary:** Psychological needs (e.g., achievement, recognition).

2. Overt and Covert Needs:

- **Overt:** Manifest needs, expressed through behavior.
- **Covert:** Latent needs, repressed or restrained.

3. Focal and Diffuse Needs:

- **Focal:** Linked to specific environmental objects.
- **Diffuse:** Generalized to various settings.

4. Proactive and Reactive Needs:

- **Proactive:** Internally driven needs.
- **Reactive:** Triggered by external environmental events.

5. Process Activity, Modal Needs, and Effect Needs:

- **Process Activity:** Activity for the sake of doing.
- **Modal Needs:** Performing tasks excellently for satisfaction.
- **Effect Needs:** Leading to specific desired outcomes.

● Interrelation of Needs:

- Needs interact and can create conflicts, with prepotent needs (e.g., pain, hunger) taking precedence.
- Needs can merge or serve each other, with some needs supporting others (subsidiation).

● Levels of Analysis:

- **Need vs. Aim:** A need is a generalized concept, whereas an aim represents a specific goal.
- **Cathexis:** The power of an object to evoke a need in a person, revealing important aspects of personality.

● Tension Reduction:

- Individuals are driven by complex motives.
- Needs create tension that is reduced when satisfied.
- People also learn to create tension for later satisfaction, increasing pleasure.
- This applies only to effect needs, while process activity and modal needs have intrinsic satisfaction.

● **Thema:**

- A thema is an interactive behavioral unit, representing needs press interactions.
- Themas range from simple to complex, representing subject-object interactions.
- The subject and the interacting person should both be considered.
- **Example:** A snub may trigger a rejection need, or failure may trigger an achievement need.

● **Need Integrate:**

- Needs are often associated with specific objects or responses through experience.
- A need integrate forms when a need, an environmental object, and responses become connected.
- A well-established thematic disposition influences how the individual responds when the need is aroused.

● **Vector-Value Scheme:**

- Murray proposed using vectors to represent behavioural directions.
- Values are broad concepts like physical well-being, knowledge, or affiliation.
- Vectors and values create a matrix representing complex behavior at any point in time.

● **Genetic-Maturational Determinants:**

- Genetic and maturational processes influence personality development.
- Early life involves new structural compositions, while middle years focus on maintaining them.
- Later life sees atrophy of old forms and functions.

● **Learning:**

- Learning involves discovering what brings pleasure or distress.
- Pleasure/pain generators are categorized as retrospective, spective, or prospective.
- They can originate in the person, environment, or interpersonal transactions.

● **Uniqueness:**

- Each person is unique, and Murray emphasized the complexity of individuals.
- He believed in capturing the individual's uniqueness through naturalistic observation and creative insight.

● **Unconscious Processes:**

- Murray accepted that unconscious factors influence behavior.
- These tendencies are often defended against or repressed, aligning with Freudian mechanisms.

● **The Socialization Process:**

- Personality development is a compromise between personal impulses and societal demands.
- Socialization occurs through conformity to cultural and societal patterns.
- Parents play a key role in developing a child's superego through reinforcement and punishment.

● **Characteristic Research and Research Methods:**

- I. **Intensive Study of Small Numbers of Normal Subjects:** Focused on thorough case studies, often of normal individuals, to understand behavior in everyday life.
- II. **The Diagnostic Council:** Multiple observers study the same subject to improve the quality of observation and reduce bias.
- III. **Instruments of Personality Measurement:** Murray developed various tools like the Thematic Apperception Test (TAT) to measure personality through fantasy and imagination.
- IV. **Representative Studies:** Murray's research included diverse studies, such as life history investigations and assessment of secret service candidates.
- V. **Current Research:** Inspired further research, particularly McClelland's study of achievement motivation, using Murray's methods.

● **McClelland and Social Motives:**

- McClelland's research on achievement motivation was inspired by Murray's identification of the achievement need.
- Thematic Apperception Test (TAT) was modified to measure achievement motivation in individuals.

Lesson: 32-33

ALBERT BANDURA'S SOCIAL LEARNING THEORY

- Behavior is explained by the interaction between cognitive, behavioral, and environmental determinants.
- Bandura believes learning principles are sufficient to explain and predict behavior and behavior change.
- Emphasis on the interaction between external stimuli and internal cognitions in a social context.

•Observational Learning

- **Modelling**: Most human behavior is learned through observation; individuals observe others and use this information to guide their own behavior.
- **Demonstrated Effects**: Subjects who observe responses from a model tend to exhibit the same responses when placed in a similar situation.
- **Example**: Behavior is shaped by observing models, such as parents, teachers, celebrities, and even fictional characters.

● **Biographical Sketch of Bandura:**

- **Education and Career**: Bandura earned his Ph.D. in Clinical Psychology from the University of Iowa (1952) and worked at Stanford University.
- **Awards**: Received several prestigious awards, including the Distinguished Scientist Award from the American Psychological Association.
- **Books and Theories**: Bandura authored influential works like Adolescent Aggression (1959) and Aggression: A Social Learning Analysis (1973), among others.

- **Contributions to Social Learning Theory:** Focused on the role of observational learning in personality development and behavior.

● **Reconceptualization of Reinforcement:**

- **Expanded Definition:** Reinforcement is not just about external rewards but also about the information it provides for future behavior.
- **Anticipatory Learning:** Reinforcement functions as anticipatory guidance, helping people predict outcomes before engaging in behavior.
- **Regulation Over Reinforcement:** Bandura prefers “regulation” to “reinforcement” as it focuses on motivating behavior through anticipatory control.
- **Self-Reinforcement:** Behavior is evaluated against internal standards, with emotions like pride or guilt acting as reinforcement.
- **Vicarious Reinforcement:** Learning occurs by observing others’ outcomes, and individuals adjust their behavior based on what they anticipate happening to them.

● **Principles of Observational Learning**

Four Key Processes:

1. **Attentional Process:** Attention is critical for learning, influenced by the model’s characteristics and the observer’s needs.
2. **Retention Processes:** Retaining behavior involves creating symbolic mental images and verbal representations of the observed actions.
3. **Production Process:** The observer must have the skills to reproduce the behavior. Lack of skills can limit performance, requiring practice and feedback.
4. **Motivational Processes:** Performance of learned behaviors depends on incentives like direct rewards, vicarious rewards, and self-satisfaction.

● **Imitation and Novel Responses:**

- **Imitation’s role in personality development:** Bandura highlights imitation’s importance in acquiring new behaviors by observing others, as seen in his Bobo doll experiment with children.
- **Learning through observation:** Children can learn novel behaviors by observing others, even without direct reinforcement or personal experience with the behavior.

- **Cognitive abilities in imitation:** Cognitive skills help individuals store, recall, and combine observations into new behavior patterns.
- **Influence of media:** Children may imitate behaviors seen in movies, TV shows, and cartoons, even aggressive ones.
- **Impact of reinforcement and punishment:** Observing a model being rewarded or punished affects whether the behavior is imitated, as seen in studies with aggressive behavior.
- **Vicarious emotional learning:** People can learn emotional responses through observation, as shown by Bandura's experiment with the buzzer and pain reactions.

● **Reciprocal Determinism:**

- **Limitations of Traditional Behavior Theories:** Critique of unidirectional behavior theories (e.g., Skinner's model, personality theories).
- **Concept of Reciprocal Determinism:** Introduction to how behavior, personal factors, and environment influence each other in an interdependent manner.
- **Interactionist Approaches to Behavior:** Difference between unidirectional, bidirectional, and reciprocal interactions in explaining behavior.
- **Behavior, Person, and Environment Interaction:** How the environment influences behavior and vice versa through mutual influence.
- **Freedom and Determinism in Reciprocal Determinism:** Balancing freedom and constraints based on the reciprocal relationship among cognition, behavior, and environment.
- **Role of Cognitive Factors, Self-System and Self-Efficacy:** The importance of personal cognitive factors like self-system and self-efficacy in regulating behavior and environment.

● **The Self-System:**

- The self-system is a set of cognitive structures regulating behavior through self-observation, judgment, and self-reaction, not a psychic agent controlling behavior.

1. Self-Observation

- Continuous self-monitoring of behavior based on factors like quality, quantity, and originality.
- May be influenced by mood or motivation.

2. Judgmental Process

- Self-reaction arises from comparing behavior to personal standards or social comparisons.
- Vary based on context and individual importance.

3. Self-Reaction

- Positive self-reactions result in self-reward, while negative judgments lead to self-punishment.
- These reactions influence future behavior and motivation.

• Social Learning and Self-Reinforcement:

1. External influences, such as parental feedback and social comparisons, shape self-reward systems.
2. Individuals internalize these external standards and develop self-reinforcement mechanisms.

• Vicarious Learning:

1. Observing others' self-reward systems, particularly through role models, can shape an individual's self-reinforcement behavior.

• Environmental Influence on Self-Regulation:

2. External factors affect self-regulation, including how behaviors are judged and the activation of self-reward or punishment mechanisms.

• Selective Disengagement Mechanisms:

Individuals may disengage from self-criticism through defense mechanisms like moral justification, displacement of responsibility, or dehumanizing victims to avoid self-condemnation.

• Personal Judgment in Self-Regulation:

3. The self-regulation process involves personal judgments at each stage.
4. providing flexibility in how behaviors are evaluated.
5. self-regulatory actions are activated.

● Applications to Therapy:

- **Behavior Modification Techniques:** Bandura's social learning theory is applied to modify undesirable behaviors, focusing on techniques for eliminating unrealistic fears.

- **Modeling and Observational Learning:** Emotional responses, including fears, can be acquired and extinguished through direct or vicarious experience with traumatic events.
- **Treatment of Phobias:** Phobias, like snake phobia, can be treated through techniques such as desensitization and symbolic or live modeling.
- **Participant Modeling:** The most effective treatment method involves participants observing a live model interact with the feared object and then practicing the behavior themselves with guidance.

● **Research**

- Focus on aggression and how aggressive behavior is learned in children.

● **Summary:**

- **Behavior Explanation:** Social Learning theorists, including Bandura, explain behavior through the interaction of cognitive, behavioral, and environmental factors.
- **Learning by Observation:** Bandura proposes that most human behavior is learned by observing others (modeling).
- **Vicarious Reinforcement:** Reinforcement occurs vicariously when one observes another experiencing consequences for a behavior, influencing their own actions.
- **Four Processes of Observational Learning:** Attention, retention, production, and motivation govern observational learning.
- **Aggression in Media:** Films, TV shows, and cartoons with aggressive models teach viewers to behave aggressively and violently.

● **Evaluation:**

- Bandura's social learning theory emphasizes observational learning and modeling in shaping personality development.

Lesson: 34-35

THE STIMULUS RESPONSE THEORY OF DOLLARD AND MILLER

- Key concept in Dollard and Miller's theory, representing a stable Stimulus-Response (SR) connection.
- Focus on the conditions under which habits are acquired and extinguished or replaced.
- Habits can form between external stimuli and responses, as well as between internal stimuli and responses.
- Primarily concerned with the acquisition and extinction of habits, rather than categorizing or listing specific types of habits.

● **Biographical Sketch:**

- John Dollard: Born in 1900, M.A. and Ph.D. in sociology from the University of Chicago. Worked at Yale University and became professor emeritus in 1969.
- Neal E. Miller: Born in 1909, B.S. from University of Washington, M.A. from Stanford, Ph.D. from Yale. Trained in Psychoanalysis at the Vienna Institute and served as a traveling fellow.
- Collaboration: Dollard and Miller combined their expertise in sociology and experimental psychology to develop the Stimulus-Response (S-R) theory.
- Pavlov: Classical conditioning, demonstrating how stimuli (e.g., sound of footsteps) can condition responses (e.g., salivation).
- Watson: Focused on objective study of overt behavior.
- Thorndike: Emphasized the role of reward and punishment in learning.
- Skinner: Rejected Hull's approach and introduced operant conditioning, shaping complex behaviors through successive approximations.
- **Learning Definition**: The connection between stimulus and response, where learning occurs when the S-R pair evokes the response.

• **Four Steps to Learning:**

1. Desire (drive)
2. Notice something (cue-stimulus)
3. Perform an action (response)
4. Receive a reward (reward)

- Habit Formation: The cue-stimulus and response should be closely associated in time and space, and the response must be rewarded.

● **The Structure of Personality:**

- **Focus:** Learning and personality development, not structure.
- **Key Concept: Habit** – Association between stimulus (cue) and response.
- **Habits:** Can be formed between external or internal stimuli and responses.
- **Theory's Focus:** Conditions for acquiring, extinguishing, or replacing habits.
- **Lack of Focus:** No emphasis on classifying or listing different habits.

● **The Dynamics of Personality:**

- **Motivation:** Defined with a focus on motives like anxiety.
- **Secondary Drives:** Learned drives, such as anxiety and shame, replace primary drives in modern society.
- **Acquired Drives:** Motivating factors like the desire to please come from secondary drives.
- **Secondary Rewards:** Neutral events (e.g., mother's smile) gain reward value from consistent association with primary rewards.
- **Reinforcement:** Secondary rewards reinforce behavior, but their effect diminishes without primary reinforcement.

● **The Development of Personality:**

• **Innate Equipment:** Inborn characteristics of the individual.

- **Reflexes:** Automatic responses to specific stimuli (e.g., sneezing when cold).
- **Response Hierarchies:** Tendency to respond to certain stimuli (e.g., crying when hungry or hearing loud noise).
- **Primary Drives:** Innate physiological drives such as hunger and sleep, linked to specific responses.

• **Learning Process:** How learning shapes behavior.

- **Learning Definition:** Connecting a stimulus (cue) to a response.
- **Learning Steps:**
 - I. Want something (drive).
 - II. Notice something (cue-stimulus).
 - III. Do something (response).
 - IV. Get something (reward).

- Response Hierarchy: The probability of certain responses occurring, influenced by experience.

● **Secondary Drive and Learning**: Secondary drives evolve through learning.

- Development: Primary drives evolve into complex secondary drives with experience (e.g., fear, phobias).
- Drive Responses: Secondary drives guide behavior like primary drives, often linked to emotional responses.

● **Higher Mental Processes**: Advanced cognitive functions develop over time.

- Cue-Producing Responses: Responses that mediate future actions, such as labeling events (e.g., identifying situations as “threatening”).
- Language Influence: Social training and language significantly impact cue-producing responses, leading to adaptive solutions.

● **Social Context**: The influence of society on personality development.

- Neurotic Conflict: Learned from parents and societal contradictions, leading to emotional problems.
- Cultural Demands: Conflicting societal expectations (e.g., aggression and submission) can overwhelm a child’s learning capacity, causing frustration and neurosis.

● **Critical Stages**: Key stages in the development process.

- Childhood Importance: Early experiences (infancy to childhood) are crucial in shaping adult behavior and emotional issues.

● **Applications of the Model**:

1. Unconscious Processes:

1. Language plays a key role in behavior and development.
2. Unconscious factors significantly influence behavior.
3. Dollard and Miller’s explanation of unconscious processes differs from Freud’s approach.

2. Conflict:

1. Personality involves conflicting motives or tendencies.

● **Five Basic Assumptions**:

- Gradient of Approach: The closer to a goal, the stronger the tendency to approach it.

- **Gradient of Avoidance:** The closer to a negative stimulus, the stronger the tendency to avoid it.
- **Steeper Gradient of Avoidance:** Avoidance tendencies increase faster than approach tendencies.
- **Drive Increase Effect:** Higher drive raises the overall strength of approach or avoidance tendencies.
- **Competing Responses:** The stronger response prevails.

•**Types of Conflict:**

2. **Approach-Avoidance:** Simultaneous attraction and fear (e.g., a young man attracted to but nervous around a woman).
3. **Avoidance-Avoidance:** Choosing between two negative outcomes (e.g., a boy afraid of climbing yet afraid of being called a coward).

•**How Neurosis is Learned:**

1. Neurosis arises from critical learning situations mishandled by parents:
 - Feeding situations.
 - Toilet training.
 - Sex education.
 - Aggression control.
2. Mishandling leads to anxiety and guilt in childhood, which persists into adulthood as neurotic conflict.

● **Psychotherapy:**

The Process of Therapy

- Dollard and Miller emphasize treating neuroses through understanding learned behaviors.

Therapeutic Approach:

- Therapist is sympathetic, permissive, and non-punitive.
- Encourages free association and emotional expression.
- Helps patients understand how their feelings and behaviors developed through stimulus-response connections.

● **Characteristic Research and Research Methods:**

- Focused on confirming predictions derived from their theory.

Key Research Areas:

- Studies on human and animal behavior.
- Concepts like displacement and stimulus generalization.
- Miller conducted experimental studies and summarized findings extensively (1944, 1951, 1959).
- Laboratory research on animals highlights stimulus-response mechanisms.

● **Summary:**

- Habit Formation: Key focus on how habits form and dissolve.
- Habit Concept: A habit links a stimulus (cue) with a response. Habits can form between both external and internal stimuli and responses.

● **Hierarchy of Responses:**

- Initial Hierarchy: Likelihood of responses in a new situation without prior learning.
- Innate Hierarchy: Inborn responses.
- Resultant Hierarchy: Learned responses after experience.

● **Evaluation:**

- Scientific Approach: The theory is elegant, economical, and closely tied to natural science.
- Lab-Oriented: It is a laboratory-based theory emphasizing stimulus-response over clinical or naturalistic observation.

Lesson: 36-37

SKINNER'S THEORY OF PERSONALITY

● **Main Points:**

- Radical Behaviorism and Skinner: Radical Behaviorism is closely associated with Skinner.

- **Rejection of Inner States:** Skinner rejected inner states like anxiety as explanations for behavior.

- **Behavior Explanation:** Behavior changes due to aversive contingencies, not inner feelings.

- **Example:** Avoiding a party is not due to anxiety but aversive contingencies causing anxiety.

- **Reinforcement History:** Actions are influenced by past reinforcement, not traits like heroism.

- **Example:** Saving people in a fire is due to prior reinforcement experiences.

- **Focus of Behaviorism:** All behavior is learned and observable.

- **Stimulus-Response Association:** Behavior involves respondent or classical conditioning.

Biographical Sketch:

- **Early Life:** Skinner was born in 1904 in Pennsylvania to a lawyer's family. He enjoyed building things during childhood.

- **Education and Career:**

- Studied English at Hamilton College, aspiring to be a writer.
 - Shifted to psychology at Harvard after an unproductive writing period.
 - Earned a Ph.D. in 1931 and worked at Harvard for five years postdoctoral.
 - First academic position was at the University of Minnesota in 1936.

- **Achievements:**

- Developed the "Skinner box," "baby box," and teaching machines.
 - Authored influential books like *Walden II*, *The Behavior of Organisms*, and *Beyond Freedom and Dignity*.
 - Received prestigious awards, including the APA's Lifetime Contribution Award.

- **Death:** Skinner died of leukemia on August 18, 1990.

- **Books:** Notable works include *The Behavior of Organisms* (1938), *Science and Human Behavior* (1953), and a three-volume autobiography.

● **Classical Conditioning:**

- **Pioneers:** Developed by Pavlov and Watson.

- **Process:**

3. UCS (meat) causes UCR (salivation) naturally.
4. UCS is paired with CS (bell) repeatedly.
5. Eventually, CS alone triggers CR (salivation).

- **Extinction:** If CS (bell) is not followed by UCS (meat), the response decreases over time.

- **Second-Order Conditioning:** A new stimulus (e.g., green light) is paired with an already established CS (bell), forming another S-R association.

- **Examples:** Jumping at the sight of a spider or feeling faint when seeing blood.

- **Impact:** S-R associations influence preferences and behaviors unconsciously.

● **Operant Conditioning:**

- **Pioneers:** First studied by Thorndike; expanded by Skinner.

- **Definition:** Voluntary behaviors (operants) operate on the environment and are influenced by their consequences.

- **Law of Effect (Thorndike):**

- Behaviors leading to satisfying consequences are repeated (reinforcement).
 - Behaviors leading to unsatisfying consequences are avoided (punishment).

- **Reinforcement:** Increases the likelihood of a behavior.

- **Positive:** Adding a reward (e.g., ice cream for good behavior).
 - **Negative:** Removing an unpleasant stimulus.

- **Punishment:** Decreases the likelihood of a behavior.

- Can be positive (adding unpleasant stimulus) or negative (removing a reward).
 - **Examples:**
 - A hungry cat learns to escape a puzzle box for food.
 - Teachers and employers use rewards and punishments to shape behavior.

- **Shaping:** Gradually reinforcing successive approximations of a desired behavior.

● **Reinforcement Strategies:**

- **Positive Reinforcement:** Increases behavior by adding a reward.

1. **Example:** A student works hard, gets an “A,” and continues working hard.
2. **Example:** A rat presses a bar to receive food.

- **Negative Reinforcement:** Increases behavior by removing or reducing an unpleasant stimulus.

- **Example:** A rat pulls a string to turn off an electric shock.
- **Example:** A person rests to relieve a headache.

- **Decreasing Behavior:**

- **Extinction:** Behavior decreases when reinforcement is stopped.

- **Example:** A child stops asking for candy when no candy is given.

- **Punishment:** Behavior decreases when followed by an aversive stimulus.

- a. **Positive Punishment:** Slapping a child for asking for candy.
- b. **Negative Punishment:** Taking away toys for poor grades.

- **Generalization and Discrimination:**

- **Generalization:** Behavior extends to similar situations.

- **Example:** A child praised for one subject performs better in others.
- **Example:** A teacher applies skills learned with one problematic student to others.

- **Discrimination:** Differentiating among stimuli or situations.

- **Example:** Distinguishing between sincere and sarcastic compliments.

- **Schedules of Reinforcement:**

- **Continuous Reinforcement:** Reinforcement occurs after every desired response.

- **Example:** Rewarding every good grade.

- **Interval Reinforcement:** Based on time intervals.

- a. **Fixed-Interval:** Reinforcement after a set time (e.g., every 5 minutes).
- b. **Variable-Interval:** Reinforcement after random time intervals (e.g., on average every 5 minutes).

- **Ratio Reinforcement:** Based on the number of responses.

- I. **Fixed-Ratio:** Reinforcement after a set number of responses (e.g., every 10th response).

II. **Variable-Ratio:** Reinforcement after a random number of responses (e.g., 2nd or 8th response).

1. **Example:** Gambling systems rely on variable-ratio schedules.

● **Methods of Treatment Based on Operant Conditioning:**

• **Shaping or Successive Approximations:**

- Reinforce behaviors that gradually lead to the desired behavior.
 1. **Examples:**
 2. Teaching a child how to read by reinforcing each step, from learning the alphabet to reading stories.
 3. Encouraging psychiatric patients to attend art therapy sessions by reinforcing each step toward the goal.

• **Systematic Desensitization:**

- Developed by Joseph Wolpe; used to treat phobias and anxiety.

• **Steps:**

1. Relaxation techniques.
2. Create a fear hierarchy.
3. Gradually pair relaxation with fear-inducing stimuli, starting from the least intense.
 - **Example:** Overcoming fear of lizards through gradual exposure.

• **Aversive Conditioning:**

- Add unpleasant stimuli to decrease undesired behaviors.
 - **Examples:**
 - Adding a substance to alcohol for drug addicts to induce nausea and reduce consumption.
 - Using soap to punish children for bad language.

• **Assertion Training:**

- Teaching individuals to politely refuse unjust demands from others (e.g., colleagues or bosses).

• **Behavior Modification:**

- Replacing undesirable behavior with desirable behavior using reinforcement.
- **Effective for:** Addictions, autism, schizophrenia, shyness, and more.

- **Token Economy:**

- Reinforce desirable behavior with tokens that can be exchanged for rewards.
- **Used in:** Mental hospitals, prisons, and special institutions.
 - **Example:** Patients receive tokens for tasks like waking up on time or taking medicines, which can be traded for privileges.

● **Applications of Skinner's Theory:**

a. Education:

- ❖ Programmed Learning.
- ❖ Teaching Machines.
- ❖ Advocates positive behavior control in schools.

b. Personal Behavior Modification:

- ❖ Used to change and improve personal habits.

c. Care for Mentally Retarded Children:

- Applied to teach and manage behavior.

d. Prison Reforms:

- Behavior management and rehabilitation programs.

e. Helping Drug Addicts:

- Applied in aversive conditioning and behavior modification techniques.

● **Summary:**

f. Skinner's Theory:

- Explains personality and specifies principles for behavior change.
- Behavior depends on reinforcement contingencies or schedules.

g. Focus:

- Observable (overt) behavior, not internal or covert processes.

- **Categories of Behavior:**

- **Classical Conditioning:** Pairing new stimulus with an existing S-R bond (Pavlov, Watson).
- **Operant Conditioning:** Behavior followed by reward or punishment (Thorndike, Skinner).

- **Reinforcement and Happiness:**

1. Happiness results from operant reinforcement (e.g., good health, respect, money).

1. Methods of Treatment Based on Operant Conditioning:

- Shaping (Successive Approximations).

- Aversive Conditioning.
- Assertion Training.
- Behavior Modification.
- Token Economy.

Lesson: 38

ALBERT ELLIS THEORY OF PERSONALITY

● Irrational Beliefs:

- People hold irrational beliefs like superstitions (e.g., black cats, number 13).
 - Examples: “I must please my boss,” “I am to blame for my failure.”
- Irrational beliefs lead to maladjustments, learned through socialization (parents, teachers, media, etc.).

● Biographical Sketch:

- Born in 1913 in Pittsburgh; grew up in New York.
- Faced health issues, became self-reliant early in life.
- Studied psychoanalysis (1947-1953) but shifted to developing REBT in the 1950s.
- Invented A-B-C model and authored 725 articles and 60 books.
- Founded the Rational Emotive Therapy Institute in 1959.

● Ellis's View of Human Nature:

- Humans are both rational (positive thinking) and irrational (crooked thinking).
- Key assumptions:
 - Biological and cultural tendencies cause irrationality.
 - People invent and maintain irrational beliefs
 - Emotional difficulties arise from self-conditioning, not external factors.
 - Humans can change by altering cognition, emotion, and behavior.

● Theory of Personality:

- Focuses on biological, social, and psychological factors causing emotional disturbances.
- **Biological Factors:** Innate tendencies to self-condemn (e.g., “I am a failure”).
- **Social Factors:** Relationships and criticism affect self-worth and expectations.

● **A-B-C Theory of Personality:**

A = Activating Event.

B = Belief System.

C = Consequences (emotional/behavioral).

• **Added components:**

D: Disputing irrational beliefs.

E: Effect of disputing on reducing irrationality.

● **Irrational Beliefs:**

○ **Examples:**

- “I must be loved by everyone.”
- “I must be perfect.”
- “It’s catastrophic when things don’t go my way.”

- These beliefs result in self-blame, emotional misery, depression, and loss of self-worth.

● **REBT Therapeutic Process:**

• **Steps:**

- i. Build rapport with the client.
- ii. Identify irrational ideas.
- iii. Challenge and validate these ideas.
- iv. Replace them with rational beliefs.
- v. Use humor, cognitive, emotional, and behavioral techniques.

● **Techniques of REBT:**

• **Cognitive Methods:** Dispute beliefs, cognitive homework, language modification.

• **Behavioral Methods:** Self-management, modeling, systematic desensitization, homework.

• **Emotional Methods:** Rational emotive imagery, role-playing.

● **Goals of REBT:**

- Minimize self-defeating, irrational outlook.
- Foster self-interest, social interest, tolerance, and self-direction.

● **Applications of REBT:**

- Treatment for anxiety, depression, marital problems, child-rearing, and self-management.

● **Summary:**

- Irrational beliefs are the basis of maladjustment.
- The A-B-C-D-E model helps modify these beliefs.
- Emphasis on scientific methods to challenge irrational behavior.

● **Evaluation:**

- Focuses on overcoming irrationality caused by socialization.
- Humans are seen as having the potential for rationality and change.

Lesson: 39

THE GRAND PERFECT THEORY OF PERSONALITY

● **Main Points:**

• **Perfect Theory of Personality**

- No perfect theory of personality exists.

- No single theory can fully address all aspects of personality or human nature.

•Best Theory:

- None of the studied theories can be labeled as the best.
- Each theory focuses on different aspects of human nature.

•Grand Ultimate Theory:

- No grand or ultimate theory exists.

•A good theory fulfills three scientific purposes:

- ❖ Provides guidelines for researchers.
- ❖ Organizes known findings.
- ❖ Makes predictions.

Functions of Personality Theories:

- Serve as maps for researchers.
- Organize findings, e.g., Freud's, Maslow's, or Allport's theories address different perspectives.

Domains of Personality Theories:

- Theories address multiple areas:

•Genes: Both genes and environment contribute to personality.

•Stages of Development: Freud, Jung, Erikson focus on developmental stages.

•Motivation: Biological and social motives play a central role.

•Learning: Skinner, Bandura, and others emphasize learning from the environment and modeling.

•Perception: Kelly, Rogers, Maslow link perception to individual differences.

•Traits: Allport and Cattell focus on trait structures like cardinal, central, and source traits.

•Emotions: Theories address anxiety, fear, guilt, and their management.

•Temperament and Body Types: Sheldon links body types (ectomorph, mesomorph, endomorph) to temperament.

•**Neurosis:** Horney, Adler, and Rogers emphasize love, respect, and positive regard for healthy development.

•**Conscious and Unconscious:** Freud and Jung explore conscious, preconscious, unconscious, and archetypes.

•**Therapy:** Consensus on psychotherapy despite theory variations.

•**Defense Mechanisms:** Freud and Horney discuss mechanisms like projection and rationalization to protect the ego.

● **Conclusion:**

• Personality psychology is still evolving and less scientific compared to fields like biology or physics.

Lesson: 40-42

PERSPECTIVES OR DOMAINS OF PERSONALITY PSYCHOLOGY

• Personality can be studied using six perspectives or domains:

- a. Dispositional
- b. Biological
- c. Intra-psychic
- d. Cognitive/Experiential
- e. Social and Cultural
- f. Adjustment

❖ **Dispositional Approach:**

- **Differences in Individuals:** Focus on how people differ in emotions, self-concepts, physiological traits, and intra-psychic mechanisms.
- **Traits and Personality:** Traits are stable internal characteristics that guide behavior and are considered the raw material for personality development.
- **Trait Classification Systems:**
 - The Natural Language Approach
 - The statistical Approach
 - The Theoretical Approach

1. **Trait Measurement:** Traits are measured both qualitatively and quantitatively.
2. **Type of Traits:**
 - a. Unique Traits
 - b. Common Traits
 - c. Surface Traits
 - d. Source Traits
3. **Personality Applications:** Traits guide career selections, e.g., aggressive individuals may fit a police role.
4. **Allport, Cattell, Kelly, Murray:** Theories explaining trait measurement and their role in behavioral consistency.
5. **Cattell's Factor Analysis:** Identifies personality traits (unique, common, surface, and source traits).
6. **Needs:** Construct that organizes perception and behavior.
7. **Types of Needs:**
 - i. Primary and Secondary Needs
 - ii. Overt needs and Covert Needs
 - iii. Focal needs and Diffuse Needs
 - iv. Proactive Needs and Reactive Needs
8. **TAT and Kelly's Personal Constructs:** Murray's TAT uncovers unconscious motives; Kelly's theory focuses on personal constructs to reduce uncertainty.

❖ **Biological Approach:**

9. **Biological Systems:** Personality rooted in biological systems (genetics, psychophysiology, and evolution).
10. **Genetics:** Personality studies in identical vs. Fraternal twins, and reared-together vs. Apart.
11. **Psychophysiology:** Studies links between nervous system, neurotransmitters, cardiac reactivity, and hormones.
12. **Evolutionary Influence:** Evolution shaped human psychological mechanisms.
13. **Research Methods:** Selective breeding, family studies, twin studies, and adoption studies.
14. **Theories:** Freud's psychoanalytic theory, Sheldon's theory, and Erikson's biological emphasis opposed by Karen Horney.

❖ **Intra-psychic Approach:**

1. **Freud's Psychoanalytic Theory:** Personality shaped by unconscious conflicts between basic needs and societal demands.
2. **Other Psychodynamic Theorists:** Jung, Adler, and Karen Horney.

3. **Conflict and Unconscious:** Focus on unconscious conflicts influencing behavior and personality.

❖ **Cognitive/Experiential Approach:**

1. **Focus on Cognition and Subjective Experiences:** Differences in cognitions, perceptions, emotions, and self. Focuses on cognition and subjective experiences like thoughts, feelings, beliefs, and desires.
2. **Experience from Personal Perspective:** Emphasis on understanding an individual's subjective experiences.
3. **Cognitive Experiences:** Perception, interpretation, goals, and strategies shape how people process information.
4. **Emotional Experiences:** Frequency of emotional states (e.g., happiness, sadness, anxiety), and emotional intensity (high or low). Emotional experiences are categorized by content (pleasant/unpleasant) and style (emotion intensity).
5. **Self Experiences:** Self experiences can be studied in terms of real vs. Ideal self, identity, introversion/extroversion, and self-actualization.
6. **Theories Related to Self Concept:**
 - Karen Horney, Rogers: Real vs. Ideal self.
 - Erikson: Self as identity.
 - Carl Jung: Introverts vs. Extroverts.
 - Maslow, Rogers: Self-esteem and self-actualization.

❖ **Social and Cultural Approach:**

- **Social and Cultural Context:** Personality shaped by social roles, expectations, and cultural norms.
- **Cultural Influence on Personality:** Differences in personality across cultures due to varying cultural forces.
- **Cultural differences:** abstract concepts in American culture vs. Social relations in Asian culture.
- **Gender Roles:** Socially constructed gender roles affecting personality.
- **Commonalities Across Cultures:** Similar emotional expressions (smiling when happy, frowning when sad).
- **Theories:** Personality theories of Allport, Cattell, Maslow, Erikson, Rogers, and Kelly are relevant in understanding these perspectives.

❖ **Adjustment:**

- Coping and Adaptation: Personality plays a role in how individuals cope with and adapt to life events and stress.
- Health Implications: Linked to physical health issues (e.g., heart disease) and mental health (e.g., stress management).
- Stress Interpretation: Personality affects how stress is appraised and managed.
- Behavioral Impact: Personality influences behaviors like smoking, drinking, and risk-taking, and also affects old age and retirement challenges.

Lesson: 43

THE GRAND THEORY OF PERSONALITY

● The Three Forces in Psychology:

- First Force – Psychoanalysis (Psychodynamic):
 - Focuses on the unconscious mind, early childhood experiences, and internal conflicts.
 - Key theories:
 - Freud (id, ego, superego)
 - Jung (collective unconscious)
 - Adler (inferiority complex)
 - Karen Horney (neurotic needs)
 - Erikson (psychosocial stages).
- Second Force – Behaviorism:
 1. Focuses on learned behaviors through conditioning, reinforcement, and environmental stimuli.
 2. Key theories:
 3. Skinner (operant conditioning)
 4. Bandura (social learning)
 5. Dollard and Miller (stimulus-response theory)
 6. Pavlov, Watson, and Thorndike (classical conditioning).
- Third Force – Phenomenology (Humanistic Psychology)
 - Emphasizes individual experience, free will, and self-actualization.
 - Key theories:
 - Maslow (self-actualization)
 - Rogers (self-concept)
 - Allport (traits)
 - Cattell (factor analysis)
 - Kelly (personal constructs)

- Murray (needs)
- Sullivan (interpersonal relationships).

● **Freud's Theory:**

- Focuses on the unconscious, psychosexual stages, and defense mechanisms.
- Psychosexual stages influence personality development.

1. Levels of Consciousness:

- Conscious: Thoughts and feelings we're aware of.
- Preconscious: Thoughts that can be brought into awareness.
- Unconscious: Repressed memories and desires influencing behavior.

2. Mental Structures:

- Id: The pleasure-seeking part, driven by instincts and desires.
- Ego: The rational part, balancing the id and reality.
- Superego: The moral conscience, representing societal rules and ideals.

3. Psychosexual Stages of Development:

- Development occurs in stages (oral, anal, phallic, latent, genital), each with a focus on different sources of pleasure.
- Fixation can occur if needs are not sufficiently met at a given stage.

4. Defense Mechanisms:

- Unconscious strategies to protect the ego from anxiety (e.g., repression, denial, projection).

5. Instincts:

- Eros (Life instinct): Drives related to survival, pleasure, and reproduction.
- Thanatos (Death instinct): Drives related to aggression and self-destruction.

6. Oedipal Complex:

- In the phallic stage, children experience unconscious desires for the opposite-sex parent and jealousy toward the same-sex parent, leading to identification with the same-sex parent.

7. Anxiety Types:

- Reality Anxiety: Fear of external threats.
- Neurotic Anxiety: Fear of uncontrollable desires from the id.
- Moral Anxiety: Fear of violating moral standards.

● **Jung's Theory:**

- Personal unconscious contains repressed memories.
- Collective unconscious holds inherited ancestral memories (archetypes).
- Psychological types: introverts, extroverts.
- Stages of development: childhood, adulthood, middle age, post-retirement.

- **Personal Unconscious:**

- Contains repressed or forgotten memories and unclear experiences.
- Includes complexes, which are clusters of emotionally charged ideas or memories connected by common feelings.

- **Collective Unconscious:**

- Inherited from our ancestors, it consists of universal memories and experiences shared by all humans.
- Comprised of archetypes, universal symbols or patterns that shape human experience.

- **Archetypes:**

- Persona: The social mask or role we present to the outside world.
- Anima: The feminine aspects within a man's unconscious.
- Animus: The masculine aspects within a woman's unconscious.
- Shadow: The unconscious part of ourselves that contains repressed weaknesses, desires, and instincts.
- Self: The totality of the psyche, integrating both conscious and unconscious elements.

- **Psychological Types:**

- Categorizes individuals based on their attitudes and functions.
- Introverts: Focus inward, more reserved.
- Extroverts: Focus outward, sociable.

- **Stages of Development:**

- Childhood: Formation of basic personality.
- Young Adulthood: Exploration and development of individuality.
- Middle Ages: Integration of the self and pursuit of deeper meaning.
- Life after Retirement: Focus on spiritual growth and reflection.

● **Adler's Theory:**

- Stresses feelings of inferiority and the striving for superiority.
- Focuses on social interest, birth order, and individuality in personality development.
- **Individual Psychology:**
 - Emphasizes the uniqueness of each individual.
 - Focuses on inner harmony and the striving for social cooperation, not selfishness or aggression.
- **Inferiority Complex:**
 - Feelings of inferiority are the driving force behind personality development.

- These feelings motivate individuals to overcome challenges and strive for success and growth.
- ***Birth Order Theory:***
- Adler proposed that birth order plays a significant role in shaping personality.
- Firstborns, middle children, youngest, and only children may develop different traits due to their position in the family.

● **Karen Horney's Theory:**

- Basic anxiety and neurotic personality are central to her theory.
- Three neurotic needs.
- Emphasizes the real self vs. Ideal self.
- ***1. Basic Anxiety:***
- The feelings of insecurity and fear a child experiences when they perceive the world as threatening or unsafe.
- ***2. Neurotic Personality:***
- Neurotic personalities develop when a person fails to resolve basic anxiety, leading to maladaptive behaviors and patterns in adulthood.
- ***3. Two Basic Needs (Safety and Satisfaction):***
- Two primary needs for children:
- The need for safety (protection from harm)
- The need for satisfaction (fulfillment of emotional and physical needs).
- ***4. Neurotic Needs:***
- Classified ten neurotic needs into three categories:
- Moving Towards People: Seeking affection and approval.
- Moving Against People: Seeking control or dominance over others.
- Moving Away from People: Seeking independence or isolation.
- ***5. Real Self vs. Ideal Self:***
- Real Self: represents the true, authentic self, with all its strengths and weaknesses.
- Ideal Self: reflects the person's aspirations and the image of what they would like to become.
- The gap between the real self and ideal self can lead to feelings of inadequacy and neurosis.

● **Erikson's Theory:**

- The role of the ego in personality development.
- Psychosocial stages of development, each with crises that shape personality.

- Positive or negative resolutions of crises affect ego strength.

1. Biology and Culture:

- Personality is influenced by biological/genetic factors and cultural/social expectations.
- Gender differences are shaped by cultural expectations.

2. Ego Psychology:

- The ego organizes life and maintains harmony with the environment.
- Erikson emphasized the autonomy and active role of the ego.

3. Psychosocial Stages of Development:

- Eight genetically determined stages, each involving a crisis:
- Positive resolution: Strengthens the ego and aids adaptation.
- Negative resolution: Weakens the ego and hinders development.

4. Identity Crisis (Fifth Stage):

- A struggle to form a positive or negative identity.
- Negative Identity: Opposes societal norms and goals (e.g., becoming what a child is warned against).

● Dollard and Miller's Theory (Behaviorism):

- Habits formed by the association of stimuli and responses.
- Learning occurs through drive, cues, responses, and rewards.

Dollard and Miller's Stimulus-Response Theory

1- Habit: Association between a stimulus (cue) and a response.

2- Conditions for Learning:

- Drive: Desire or motivation to achieve something.
- Cue-Stimulus: Recognition or noticing of something.
- Response: Action taken by the individual.
- Reward: Positive outcome or reinforcement following the response.

● Skinner's Theory (Behaviorism):

- Radical behaviorism rejects inner states and focuses on observable behavior.
- Operant conditioning: behavior is shaped by reinforcement (positive and negative) and punishment.
 - Operant:
- A response that changes the environment, which in turn influences the response.
 - Operant Conditioning:
- Focuses on consequences affecting behavior frequency.
- Reinforcement: Increases behavior frequency.

- Positive reinforcement: Adding a reward.
- Negative reinforcement: Removing an unpleasant stimulus.
- Punishment: Decreases behavior frequency.
- Extinction: Behavior stops when reinforcement ceases.
 - **Applications:**
- Behavior shaping via rewards and punishments by teachers, judges, and employers.

● **Bandura's Theory (Behaviorism):**

- Social learning theory: behavior is learned through observation and modeling.
- Concepts of self-efficacy and reciprocal determinism.
- 1. Observation and Modeling:**
 1. Human behavior is learned by observing others (models).
 2. Observed behavior guides individual actions.
- 2. Modeling Demonstration:**
 1. Subjects replicate behaviors observed in similar settings.
 - Example: Violent media (films, TV, cartoons) teaches aggressive behavior to observers.

● **Maslow's Theory (Humanistic):**

1. Hierarchy of needs, with self-actualization as the ultimate goal.
 2. Higher-level needs can only be pursued after basic needs are met.
- **Hierarchy of Needs:**
 - Physiological needs (basic survival).
 - Safety needs (security).
 - Love/belonging needs (relationships).
 - Esteem needs (achievement, respect).
 - Self-actualization (reaching full potential).
 - **Self-Actualization:**
 - Achieving one's highest potential in all areas.
 - Requires freedom and growth opportunities.

● **Roger's Theory (Humanistic):**

1. Emphasizes self-concept and the importance of self-actualization.
2. Focus on the real self, ideal self, and congruence.

3. Fully functioning person: one who is open to experiences and realizes their potential.

● **Kelly's Theory (Humanistic):**

1. Personality is based on the individual's personal construct system.
2. Focus on how people interpret and organize experiences.

● **Murray's Theory (Humanistic):**

1. Personality reflects patterns of behavior based on internal needs and motives.
2. Emphasizes goal-directed behavior and conflict resolution.

● **Cattell's Theory (Humanistic):**

1. Focus on factor analysis to identify surface and source traits that define personality.

● **Sullivan's Theory (Humanistic):**

2. Personality develops through interpersonal relationships and social interactions.

● **Evaluation of the Forces in Psychology:**

- Psychoanalysis (First Force):
- Criticized for reducing human behavior to instinctual drives.
- Behaviorism (Second Force):
- Criticized for reducing human behavior to stimulus-response and neglecting inner thoughts and feelings.
- Phenomenology (Third Force):
- Restores human beings to their actual level by focusing on individual experience, free will, and self-growth.
- Each force and its corresponding theories offer unique insights into personality development and human behavior.

PERSONALITY APPRAISAL

● Personality Assessment:

• Sources of Personality Data:

- **Self-Report Data (S-Data):** Information individuals provide about themselves via questionnaires or interviews (structured or unstructured).
- **Observer-Report Data (O-Data):** Impressions formed by others, including family, friends, or professionals.
- **Test Data (T-Data):** Standardized testing situations to measure specific traits or reactions.
- **Life Outcome Data (L-Data):** Outcomes of life events, such as work, marriage, or divorce, linked to personality traits.

• Self-Report Data (S-Data):

1. Most common data source for personality; based on questionnaires or interviews.
2. **Forms:** Unstructured (open-ended questions) and Structured (closed-ended questions).
3. **Advantages:** Easy to collect.
4. **Limitations:** Participants may not be honest or self-aware.
5. **Example tools:** Neo Personality Inventory, California Personality Inventory.
6. **New trend:** Experience sampling (daily mood or physical symptom reports).

• Observer Report Data (O-Data):

- Data from impressions formed by observers (family, friends, colleagues).
- **Advantages:** Access to information not available through self-reports; multiple observers provide diverse perspectives.
- **Inter-rater reliability:** Multiple observers assess the same individual.
- **Two types of observers:** Professional assessors or intimate observers (close friends, family).
- Naturalistic vs. Artificial settings for observation.

• Test Data (T-Data):

- Standardized testing situations to elicit personality indicators.
- **Example:** Frustrating situations, leadership tasks.
- **Limitations:** Participants may create impressions or misinterpret the situation.
- Mechanical recording devices like the Actometer assess activity level or energy.

• Physiological Data:

- Measurements of physical responses (e.g., heart rate, muscle contractions) to stimuli.

•**Example:** Eye-blink reflex used to study psychopaths' response to anxiety-inducing stimuli.

•**fMRI:** Measures brain activity by detecting blood flow to specific brain regions during tasks.

- ***Life Outcome Data (L-Data):***

- Data about life outcomes (e.g., work, marriage) that reflect personality traits measured earlier in life.

•***Examples of Research Studies:***

- Megargee's Study on Dominance and Leadership: Examined the impact of dominance on leadership roles using the California Personality Inventory.

•***Limitations of Data Collection Methods:***

- Self-reports may not be truthful or self-aware.
- Observer reports may be biased, especially if the observer has a close relationship with the individual.
- Test data may be influenced by how participants perceive and respond to the situation.

● ***Projective Personality Tests:***

- Assess unconscious thoughts and emotions.
- Use ambiguous stimuli like inkblots or pictures.
- Reveal desires, fears, and personal projections.

•***Common Tests:***

- ***Rorschach Test:*** Inkblots, measures perception and cognition.
- ***TAT (Thematic Apperception Test):*** Storytelling based on pictures, reveals unconscious needs.
- ***HTP (House-Tree-Person):*** Evaluates interpersonal relationships, ego development, and self-perception.
- ***RIST (Rotter's Incomplete Sentence Blank):*** Complete unfinished sentences, explores social attitudes and conflicts.

•***Advantages of Projective Tests:***

1. Provide insight into unconscious thoughts.
2. Can reveal a person's unique perspective of the world.
3. Useful as supplements to other assessment methods.

•***Limitations of Projective Tests:***

- Lack of standardized administration and scoring.

- Low reliability in scoring and interpretation.
- Time-consuming, especially tests like the Rorschach.

● **Assessment Issues:**

- Links Among Various Data Sources: Strong agreement across sources increases confidence in findings.
- Fallibility of Personality Measurement: Triangulation used to overcome measurement flaws (e.g., self-report vs. Observer report).

● **Evaluation Criteria for Personality Measures:**

- Validity: Measures what it claims to measure (types include face, content, and predictive validity).
- Types of Validity:
 - Face validity
 - Content validity
 - Predictive validity
 - Criterion validity
 - Convergent validity
 - Divergent validity
 - Discriminant validity
 - Construct validity
- Reliability: Consistency in measurement (e.g., test-retest, inter-rater reliability).
- Kinds of Reliability Includes:
 - Test Retest Reliability or Repeated Measures
 - Alternate Forms or Parallel Forms
 - Split Half
 - Other important things
 - Inter Rater Reliability
- Generalizability: Measure's validity across different groups (age, culture, gender).

● **Research Designs in Personality Psychology**

1. Experimental Design: Determines causality; manipulates variables.
2. Correlational Design: Measures relationships between variables, but cannot establish causality.
3. Case Study: Provides detailed, personal insights; often used for hypothesis generation.

● Summary

- No perfect personality assessment method.
- Research goals determine the tools and designs used.
- Various designs have their strengths and limitations.

Lesson: 45

PERSONALITY PSYCHOLOGY: NEW DIRECTIONS IN THE DISCIPLINE

- There has been tremendous contribution in each area of personality psychology some things have been added in existing concepts while totally new things have also been added such as the adjustment Perspective or the focus on Neurological aspect of personality study.

● Definition of Personality:

- Personality is a set of traits that distinguish individuals.
- Traits such as shy, intelligent, generous, talkative, etc.
- Traits help describe, explain, and predict behavior.

•Psychological Mechanisms:

- Refers to processes in personality, often involving information processing.
- Activated under specific conditions or situations.

•Consistency Across Time and Situations:

- Personality is stable across time and situations.
- Example: One feels like the same person over time (yesterday, last week).

•Organized Personality:

- Traits and mechanisms are linked in a coherent, organized manner.
- Decision rules govern which needs are activated or inactive.
- Example: Hunger is inactive, while interview preparation is active.

•Influential Forces in Personality:

- Traits and mechanisms influence behavior, self-perception, interactions, and environment selection.

- Personality plays a key role in shaping one's life and experiences.

•**Person-Environment Interaction:**

- How individuals perceive and interpret their environment.
- Example: A clown's smile is seen as friendly, while a stranger's smile might be viewed with suspicion.

•**Adaptation:**

- Personality helps in adaptive functioning: achieving goals, coping, and adjusting to challenges.
- Example: People who worry a lot may adapt by receiving social support.

•**Different Environments Influencing Behavior:**

- Physical Environment: Challenges like extreme temperatures, threats from animals, etc.
- Social Environment: Challenges related to relationships, belonging, and acceptance.
- Intra-Psychic Environment: Internal experiences like memories, desires, dreams, and fantasies.
- All three environments are essential for survival and influence behavior.

● **Analysis of personality:**

- Three levels of Personality analysis
 - **Like All Others (The Human Nature Level):**
 - Traits and mechanisms common to all humans.
 - Example: All humans have language skills for communication.
 - Universal psychological mechanisms: Need for social harmony and belonging.
 - **Like Some Others (Individual and Group Differences):**
 - 1. Individual Differences: People differ in social behavior; some are introverts, others extroverts.
 - 2. Group Differences: Certain personality traits common in specific groups (e.g., cultures, age groups, genders, political affiliations).
 - **Like No Others (The Individual Uniqueness Level):**
 - No two individuals, not even identical twins, have exactly the same personality.
 - Focus on the unique personality traits that make each person distinct.
- These three levels provide a comprehensive framework for understanding personality: universal traits, group/individual differences, and unique individual characteristics.

● **Criteria to evaluate a theory:**

• Criteria for Evaluation of Personality Theory

- ***Verifiability***
 - The theory must be testable and supported by empirical evidence.
- ***Heuristic Values***
 - The theory should generate new ideas, research, and questions.
- ***Internal Consistency***
 - The theory must be logically coherent, with concepts and principles that align without contradictions.
- ***Parsimony***
 - The theory should be simple, with no unnecessary assumptions or components.
- ***Comprehensiveness***
 - The theory should explain a wide range of human behaviors and personality phenomena.
- ***Functional Significance***
 - The theory should have practical value and contribute to real-world applications.

● **Purposes of a Good Personality Theory:**

- Provides a guideline for researchers.
- Organizes known findings.
- Makes predictions.

● ***Six Perspectives or Domains of Personality***

- ***Dispositional***: Focuses on traits and individual differences.
- ***Biological***: Explores the influence of genetics and physiology.
- ***Intra-psychic***: Emphasizes internal mental processes (e.g., unconscious motives).
- ***Cognitive/Experiential***: Examines thoughts, feelings, and subjective experiences.
- ***Social and Cultural***: Studies how personality interacts with social and cultural contexts.
- ***Adjustment***: Focuses on adaptation, coping, and stress management (recent addition).

● **Personality Measurement:**

- **Personality Assessment**

- Sources of Personality Data:
 - Self-Report Data (S-Data): Information provided by individuals about themselves.
 - Observer Report Data (O-Data): Observations made by others.
 - Test Data (T-Data): Results from standardized tests.
 - Life Outcome Data (L-Data): Information from real-life events and achievements.

- **Personality Measurement**

- Types of Tests:
 1. Objective Tests: MMPI-I, CPI, EPPS, 16PF.
 2. Projective Tests: RISB, TAT, WAT.

3. Evaluation of Personality Measures:

- Reliability: Consistency of results.
- Validity: Accuracy in measuring what it claims to measure.
- Generalizability: Applicability across different situations and groups.

4. Research Designs in Personality:

- Experimental Studies: Controlled tests to establish cause-and-effect relationships.
- Correlational Studies: Examines relationships between variables without manipulation.
- Case Studies: In-depth analysis of a single individual or group.

● Advantages: Detailed insights.

● Limitations: Lack of generalizability.

● New Frontiers in Personality Research:

1. Cognitive Processes:

- Focus on how cognitive processes relate to other aspects of psychological functioning.
- Earlier theories, like Freud's and Skinner's, largely ignored cognition, while Bandura and Kelly emphasized its role.

2. Productive, Talented, and Creative Persons:

- Shift from studying pathology to understanding creativity and productivity.

- Focus on strengths rather than just dysfunction.

3. Physiological and Neurological Determinants:

1. Emphasis on biology, including behavior genetics, neurophysiology, and biochemistry.
2. Freud and Murray acknowledged biological bases, but others overlooked them.

4. Personality Development in Middle and Old Age:

1. Addressing the neglected study of adult development.
2. Moves beyond childhood and adolescence to explore changes in later life.

5. Self-Regulatory Processes and Plans:

- Study of how individuals regulate their behavior and set goals.
- Inspired by Bandura's research on self-control and self-regulation.

6. Situational Factors and Personality Variables:

- Investigating the interaction between traits and situational influences on behavior.
- Freud and Allport emphasized stable traits, while Bandura and Skinner highlighted situational factors.

7. Practical Problems in Human Affairs:

1. Application of personality psychology to real-world problems like mental health, productivity, and relationships.
2. Focus on improving individual well-being and social dynamics.

• Future Directions in Personality Psychology

1. Personality theories must generate new research and adapt based on empirical evidence.
2. Exploration in these seven areas aims to deepen our understanding of human nature and advance the field.

● A Final Word: Summary of Personality Psychology Course

• Understanding Personality:

- Much remains unknown, but theories provide the best explanations for personality.
- Therapeutic techniques must align with individual needs.

• Core Achievements of the Course:

- Established an integrated concept of personality.
- Developed understanding of personality assessment and measurement.
- Discussed all major personality theories with key themes and examples.
- Linked concepts to Pakistani culture for practical relevance.
- Focused on self-understanding and analysis.

• Benefits of the Course:

- **Individual Level:**
 - Enhanced self-understanding, growth, and self-esteem.
 - Better adaptation to societal changes and technological advancements.
 - Improved stress management and academic performance.
- **Community Level:**
 - Understanding and appreciating group differences.
- **National Level:**
 - Contribution to societal harmony and personal satisfaction.
- **Applications of Personality Psychology:**
 - Relevant to students in business, law, medicine, human resources, administration, mass communication, and literature.
 - Helps resolve intra-psychic (internal) and extra-psychic (external) conflicts for smoother interpersonal relationships.
- **Key Outcomes:**
 - Growth toward self-actualization and self-esteem.
 - Understanding personality traits to enhance academic and personal effectiveness.
 - Creating congenial personalities for better individual and social well-being.
