What is research 2

Research is simply the process of finding solutions to a problem after through study and analysis of the situational factors. It is gathering information needed to answer a question, and thereby help in solving a problem.

What is historiography 2

Historiography is the method of doing historical research or of gathering and analyzing historical evidence.

Difference between survey interview and field research interview 3

Survey Interview

- It has a clear beginning and end.
- The same standard questions are asked and in same sequence.
- Interviewer appears neutral at all times.

Field Interview

- The beginning and end are not clear.
- Questions and order are tailored to specific people and situations.
- Interviewer shows interest in responses, encourages elaboration.

Two types of grounded theory study 2

The two popular approaches to grounded theory are the systematic procedures of Strauss and Corbin (1990, 1998) and the constructivist approach of Charmaz (2005, 2006).

Enlist 6 features of theoretical framework 3

1. Inventory of variables:
2. . Specify the direction of relationship
3. Give a clear explanation of why we should expect the proposed relationships to exist
4. Make an inventory of propositions.
5. Arrange these propositions in a sequential order.
6. Schematic diagram of the theoretical model be given

Enlist parts of main body of report 3

Main body

1. Introduction
2. Methodology
3. Results
4. Conclusions and recommendations
5. References

Difference between ethnography and phenomenology 3

Ethnography is a qualitative design in which the researcher describes and interprets the shared and learned patterns of values, behaviors, beliefs, and language of a culture-sharing group,

A ***phenomenological*** *study* describes the meaning for several individuals of their *lived experiences* of a concept or a phenomenon.

Difference between cross sectional and longitudinal studies 5

Cross-Sectional Research. In cross-sectional research, researchers observe at one point in time. Cross-sectional research is usually the simplest and least costly alternative. Its disadvantage is that it cannot capture the change processes. Crosssectional research can be exploratory, descriptive, or explanatory, but it is most consistent with a descriptive approach to research.

Longitudinal Research. Researchers using longitudinal research examine features of people or other units at more than one time. It is usually more complex and costly than cross-sectional research but it is also more powerful, especially when researchers seek answers to questions about change. There are three types of longitudinal research: time series, panel, and cohort

Make observation more than one time i.e. over a long period. Cross-sectional studies. Longitudinal studies. Repeated over an extended period. Employees behavior before and after top management change Panel studies Cohort studies

Difference between realistic and critical ethnography 5

- The realist ethnography is a traditional approach used by cultural anthropologists. It reflects a particular stance taken by the researcher toward the individuals being studied
- The critical ethnography involves the authors advocate for the emancipation of groups marginalized in society

Note on role of recorder 10

Functions of the Recorder

The recorder should keep a record of the content of the discussion as well as emotional reactions and important aspects of group interaction. Assessment of the emotional tone of the meeting and the group process will enable the researcher to judge the validity of the information collected during the FGD. Record the following:

Date, time, and place:

- Names and characteristics of participants:
- General description of the group dynamics (level of participation, presence of a
- dominant participant, level of interest): Opinions of participants, recorded as much as possible in their own words, especially
- for key statements: and Vocabulary used, particularly in focus group discussions that are intended to assist in

A supplementary role for the recorder could be to assist the facilitator (if necessary) by drawing his/her attention to

- Missed comments from participants, and
- Missed topics (the recorder should have a copy of the discussion guide, key probe questions during the FGD).

If necessary, the recorder could also help resolve conflict situations that facilitator may have difficulty handling.

Difference between participant observation and non participant observation 5

In **participant observation** the researcher directly observes and participates in small scale social settings in the present time. Such a study is also referred to as field research, ethnography, or anthropological study. Here the researchers:

-Study people in their natural settings, or in situ.

-Study people by directly interacting with them.

- Gain an understanding of the social world and make theoretical statements about• members' perspective.

Non-participant studies are such where the research tries to observe the behavior of people without interacting with them. It could be observing the behavior of shoppers in a departmental store through a mirror or on a closed circuit TV. Somebody might be counting the number of vehicles crossing a particular traffic light.

Bt406 diffr ques

1.difference b/w dependent and independent variable..? 2
2.Write methods by J crewsll(name nai yaad sai) 3
3.challenges in case study..? 3

sign of bright future

4 : source of concept?
5:points to keep in mind while making table...? 5

1. Give each table a number.
2. Give each table a title, which names variables and provides background information
3. Label the row and columns variables and give name to each of the variable categories.
4. Include the totals of the columns and rows. These are called *marginal.* They equal the univariate frequency distribution for the variable.
5. Each number or place that corresponds to the intersection of a category for each variable is a *cell of a table.*
6. The numbers with the labeled variable categories and the totals are called the *body of the table.*
7. If there is missing information, report the number of missing cases near the table to account for all original cases.

Sources of Concept 2

We create concepts from personal experiences, creative thought, or observation. The classical theorist originated many concepts like family system, gender role, socialization, self-worth, frustration, and displaced aggression.

We also borrow concepts from sister disciplines

We create concepts from personal experience. Mass, speed, family. We borrow from other disciplines. We develop a specialized jargon or terminology for a particular subject

2. Difference between dependant & independent variables. 2

The cause variable, or the one that identifies forces or conditions that act on something else, is the independent variable. The variable that is the effect or is the result or outcome of another variable is the dependent variable (also referred to as outcome variable or effect variable).

3. Rights of Participants in Study. 3

No physical harm, discomfort, pain, embarrassment, or loss of privacy. Follow three guidelines: 1. Explain study benefits. 2. Explain respondent rights and protections. 3. Obtain informed consent.

rights of participants ka ans

4. Theoretical Framwork, Six Features? 3

5. Difference between Exploratory and descriptive research. 5

- Initial research conducted to clarify and define the nature of the problem. Exploring a new topic.

Specifically, there could be number of goals of exploratory research

- Research designed to describe characteristics of the phenomenon understudy.
- Helps in diagnostic analysis

6. Difference between cross sectional studies & longitudinal Studies. 5
