

ENG524 Short Notes By Pin2

Eng 524 (Finals Notes)

Chapter 19:

Critical Discourse Studies (CDS) can be applied to various contexts, such as understanding economic shifts in post-industrial countries and examining the commodification of knowledge and communication. CDS explores the textual mediation of social reality and the semiotization of contemporary life. It analyzes how language is central to different working contexts and how workers must account for their labor through language. CDS aims to improve people's lives and address social problems through socially committed research.

However, there are limitations to CDS and its application in applied linguistics. One criticism is that it tends to focus on elite domains of society, such as medical, legal, media, and corporate settings, while neglecting other domains of language expertise. There is a need to explore diverse terrains and expand the scope of workplace studies beyond the usual contexts. Workplace discourse analysis often abstracts language as a "text" for analysis, potentially overlooking the normative systems of regulation and surveillance that structure workplace discourse.

Future directions for CDS involve finding discourses recognized within the social practice being critiqued and collaborating with non-academics. This requires understanding the training and perspectives of language workers in different domains. CDS should be open to new forms of writing, avoid linguistic orthodoxies, and listen to alternative views of language and learning. There is a potential for CDS to be applied in areas such as advertising, but it requires understanding how advertisers themselves think about language.

To effect change, CDS needs to be recognized within the sites of intervention and valued by more than just linguists themselves. This may involve de-centering the linguist as the ultimate authority on language and power and finding ways to make the research relevant and useful. Direct intervention and collaboration with non-linguists can lead to practical applications of discourse research and contribute to effecting change within systems, institutions, and workplaces.

In conclusion, CDS has the potential to address social problems and improve people's lives through applied research. Future studies should expand the scope of workplace discourse analysis, challenge linguistic orthodoxies, and collaborate with non-academics to make research more relevant and useful in real-world contexts.

Chapter 20:

Historiographical Critical Discourse Analysis (CDA) focuses on revealing hidden assumptions in historical accounts and exploring the construction of meanings about the past. It recognizes that the past is not a pre-existing object but is constructed through semiotic work. The discourses about the past are constructed through social actors' work in identity-building processes and can occur in various social practices, from everyday experiences to institutionalized practices like history textbooks.

Memory and history are two constructs related to the past. Memory is connected to lived experience and testimony, while history is more concerned with the reformulation of experience into a scientific discourse. Both memory and history shape the meaning of the past and are co-constructed and validated by a community. Historiographical CDA examines the representations of the past and how they are constructed through language. It explores the interplay between discourses about the past from different social actors and analyzes the contested nature of historical discourses.

CDA contributes to historiography by expanding notions of intertextuality, recontextualization, and resemiotization. It adopts a diachronic perspective to explore historical phenomena over time. Discourse-Historical Method, introduced by Wodak, integrates historical context into CDA and emphasizes the importance of historicity in understanding the continuities of discourses. CDA studies also draw on

linguistic anthropology, situating discourse in its context of production and reception and emphasizing historical layering and ethnography.

Future historiographical CDA should continue developing analytic methods and concepts to explore the socially distributed nature of discourses about the past. It should integrate the analysis of representations with the processes and social practices where the past is constructed. Exploring intertextual positionings, dialogism, and multi-modal analyses will be important. Additionally, comparative studies and collaborations in multidisciplinary groups will help understand the hegemonic and counter-hegemonic practices in the uses of the past.

In conclusion, historiographical CDA contextualizes representations of the past, investigates the context of production and reception of historical discourse, explores varying scales and indexical meanings, and considers claims to legitimacy and social distribution. CDA studies have applied these principles to explore contested discourses about the past and contribute to critical readings of historical events.

Chapter 21:

Critical Discourse Studies (CDS) has gained success in the social sciences because of its recognition of the relationship between language use, contexts, and structures. CDS is not solely interested in language use itself but in understanding the workings of power relations and the effects they have through meaning-making processes. To engage in CDS, one must reflect not only on linguistic means but also on understanding the social dimensions. Social theories provide a systematic and abstract reflection on the workings of the social world, encompassing the interplay of action, order, and change.

CDS has drawn on various social theories, although it has not always explicitly made these theories explicit. References to scholars such as Louis Althusser, Pierre Bourdieu, Judith Butler, Michel Foucault, Anthony Giddens, Antonio Gramsci, Jürgen Habermas, Ernesto Laclau, among others, can be found in CDS studies. These references serve individual projects and offer potential for theoretical elaboration. Several questions related to social theories remain relevant within CDS and are approached differently by different strands of the field.

Two dominant social theories that have influenced CDS are Karl Marx and (neo-)Marxist approaches, as well as Michel Foucault and other post-structuralists. Marx's framework for understanding social dynamics in capitalist societies has had a significant influence on CDS, recognizing the importance of language and culture in contemporary capitalist societies. Foucault's concept of discourse as constitutive of subjects, social relationships, objects, and conceptual frameworks has been particularly influential in CDS. Other social theories, such as those of Althusser, Gramsci, and the Frankfurt School, have also informed CDS, addressing concepts like ideology, hegemony, and the problem of order.

Recent developments in CDS have also incorporated other theoretical perspectives. Corpus linguistics studies have drawn on Foucauldian notions of discourse, and Queer Theory has gained notable interest within CDS. The works of Goffman, Deleuze, Guattari, and others have been utilized to analyze interactions and social orders. The incorporation of social theory in CDS provides conceptual frameworks and analytical tools to understand the complexities of power, discourse, social change, and the interplay between the discursive and extra-discursive.

While there are differences in the extent and use of social theory within CDS, the connection between CDS and social theory is necessary for CDS to fulfill its claims. Bringing together different theoretical approaches offers a flexible toolkit for problem-oriented research, although it may also lead to contradictions at times. Marxist-inspired scholars aim to uncover interconnections and hidden resources of meaning creation, while post-structuralists emphasize openness, difference, and the contingency of meaning-making. The existing links between CDS and social theory should be deepened further to advance the field and its understanding of the social

Chapter 22:

Political language is intricately linked to politics itself. In Aristotle's view, humans are political animals because of their unique capacity for speech. He distinguishes between "voice," which is possessed by all animals and communicates basic feelings, and "speech," which is uniquely human and serves the purpose of indicating what is useful, harmful, just, and unjust. Language, in this sense, plays a crucial role in political associations as it signifies and communicates what is advantageous or disadvantageous based on shared perceptions of values.

Political discourse analysis focuses on studying discourse in political forums, such as debates, speeches, and hearings, as the main object of investigation. It involves the formal exchange of reasoned views regarding alternative courses of action to address societal issues. Through this analysis, researchers aim to uncover the ways in which language choices are manipulated to achieve specific political effects. Political discourse analysis encompasses various levels of linguistic analysis, including lexicon, grammar, pragmatics, and discourse structure.

Different approaches can be employed in the analysis of political discourse. These approaches involve understanding the interactive and negotiated nature of political discourse, examining the use of language in signaling political distinctions, exploring the negotiation and imposition of representations through language, and recognizing the role of spatial cognition, metaphorical reasoning, and emotions in political communication. Political discourse analysis encompasses not only the linguistic and rhetorical aspects but also the social, cultural, and psychological dimensions of political behavior.

Political theory, on the other hand, refers to a body of knowledge concerned with the study of the state, government, and society. It involves conceptualizations, assumptions, and statements about the nature, purpose, and key features of political life. Political theory encompasses both philosophical and empirical approaches, aiming to explain, describe, and prescribe political phenomena. It also involves the evaluation of political institutions and practices based on moral and philosophical principles.

In political theory, the nature of politics is deliberative, as it involves decision-making processes. Political discourse is inherently deliberative, even though consensus or resolution of disagreements is not always achieved. Deliberation involves weighing reasons and considering proposals in favor of or against certain courses of action. Additionally, political theory addresses issues related to minority rights, including language and cultural rights, which can give rise to debates about special protections and the right to free expression.

In summary, political language and discourse are crucial aspects of politics, playing a significant role in shaping and communicating values, influencing decision-making processes, and reflecting social and cultural contexts. The analysis of political discourse requires a multidimensional approach that combines linguistic, social, cultural, and philosophical perspectives. Political theory explores the principles and features of political life, encompassing both empirical observations and normative evaluations.

Chapter 23:

Critical Discourse Analysis (CDA) is an approach used to analyze and understand how language is used in texts, particularly in political discourse. It focuses on the linguistic choices made in these texts and examines how they shape and convey ideological beliefs. CDA goes beyond a descriptive analysis and aims to uncover the social functions of language, including how texts reflect and reinforce power dynamics and social norms.

One aspect of CDA is the analysis of political genres. Genres are specific linguistic patterns or text types that have developed within a community to fulfill particular communicative tasks. These genres are shaped by discourse communities, which are groups of individuals with specific social roles. By studying political genres, we can gain insights into how language is used in political contexts and how it influences social expectations and ideologies.

CDA also explores the construction of political identity in discourse. It examines how politicians present themselves and their parties through language, focusing on the strategic use of image, slogans, and manifestos. Political identity plays a crucial role in electoral success, and understanding how it is constructed and perceived is essential for analyzing political discourse.

The analysis of ideological beliefs in political discourse is another important aspect of CDA. Language is seen as a tool for representing and shaping reality, and ideological beliefs influence how individuals interpret and communicate their perspectives. By examining the linguistic choices and representations in discourse, CDA aims to uncover the underlying ideologies and power dynamics at play.

Lastly, CDA examines political stance-taking, which refers to the expression of opinions, evaluations, and alignments in discourse. Stance-taking involves the subjective positioning of individuals in relation to objects, ideas, or other people. It includes elements such as evaluation, modality, and interpersonal dynamics. Analyzing political stance helps to understand how individuals express their views, seek consensus, and influence public opinion through language.

In summary, Critical Discourse Analysis focuses on the analysis of political discourse by examining linguistic choices, political genres, ideological beliefs, and political stance-taking. It provides insights into how language is used to shape and convey ideologies, influence social perceptions, and exert power in political contexts.

Chapter 24:

The theory of stance-taking, as described in the provided material, focuses on the act of expressing one's position or viewpoint through language. Stance refers to the ability to assign value to objects, position oneself in relation to those objects, and invoke sociocultural values. It involves various linguistic resources, such as evaluative words, modal verbs, punctuation, and different languages, to convey attitudes, beliefs, evaluations, and judgments.

The theory identifies several components and processes involved in stance-taking. These include the stance-taker (the person expressing their stance), the stance-object (the topic or object under discussion), the resources used to convey stance, and the addressee/s (the intended audience). Additionally, the theory aims to provide a general understanding of how stance is produced and interpreted in social interactions.

The material further explains different kinds of stance. Epistemic stance pertains to knowledge and beliefs, while attitudinal stance relates to feelings and personal perspectives. Stylistic stance involves the way something is said, including comments on communication itself. These stance types are expressed through linguistic elements like adverbials, verbs, adjectives, and complement clauses.

Contextualizing stance is crucial for interpretation. Stance is situated within utterances, and contextualization cues help determine the stance-taker, the object of stance, and the stance being responded to. Subjectivity and positioning are closely related to stance-taking. Personal pronouns, affective verbs, and specifying the object of stance contribute to expressing one's subjective perspective and positioning oneself in relation to others.

Alignment is another important aspect of stance-taking. It refers to the cooperative engagement and agreement between participants in an interaction. Alignment can take different forms, such as agreement on propositions, activity alignment in collaborative tasks, or affiliation with the speaker's stance.

Finally, the theory introduces the concept of the stance triangle, which represents the interconnectedness of evaluation, positioning, and alignment in stance-taking. The evaluative vector originates from the stance-taker, the positioning vector from the second subject, and the alignment vector represents the cooperative engagement between the two subjects.

Overall, the theory of stance-taking provides insights into how individuals use language to express their viewpoints, attitudes, and beliefs. It emphasizes the relational nature of stance and its role in social interactions, highlighting the various linguistic resources and contextual cues involved in stance expression.

Chapter 25:

Neoliberalism, globalization, and Critical Discourse Analysis (CDA) are interconnected concepts that shed light on the economic, political, and discursive aspects of contemporary society.

Neoliberalism is an economic ideology characterized by free market trade, deregulation, privatization, and the emphasis on individualism. It gained prominence in the 1970s and has since become the dominant economic framework globally. Neoliberalism seeks to limit the involvement of the state in business and industry, promote free markets, and shift social welfare responsibilities to individuals. It is both an economic system and an ideology that has permeated various aspects of society, including discourse.

Globalization, initially referred to as "globalization" and associated with the expansion of free trade in the 1980s and 1990s, is closely intertwined with neoliberalism. It involves the increasing interconnectedness and interdependence of economies, societies, and cultures on a global scale. Globalization has facilitated the spread of neoliberal policies and practices, enabling the expansion of markets, cross-border trade, and the movement of capital.

Critical Discourse Analysis (CDA) is an analytical approach that examines language and discourse to uncover power relations, ideologies, and social structures. CDA is particularly relevant for studying neoliberalism and globalization as it allows for the analysis of how discourse reproduces and reinforces neoliberal ideas, influences public perceptions, and shapes power dynamics. CDA helps reveal the ways in which neoliberalism is discursively constructed, legitimized, and disseminated.

CDA scholars have explored the discursive strategies employed in neoliberal discourses. They have examined how neoliberalism is framed, justified, and presented as the only viable economic system. They have also analyzed the ways in which neoliberal discourses construct and reinforce notions of individual responsibility, market competition, and the primacy of economic growth. CDA highlights the role of language in shaping economic representations and influencing public understandings of the economy.

Moreover, CDA has shed light on the tensions and contradictions within neoliberal discourses and the impact on different social groups. It has exposed how neoliberal policies may exacerbate inequalities, reinforce power imbalances, and limit democratic participation. CDA helps challenge dominant discourses and facilitates the exploration of alternative narratives and counter-hegemonic responses to neoliberalism.

In conclusion, neoliberalism and globalization are interconnected phenomena that have shaped economic, political, and social landscapes worldwide. CDA offers a valuable analytical framework to critically examine the discursive construction, dissemination, and effects of neoliberalism and globalization. It enables us to understand the power dynamics, ideologies, and social implications embedded in contemporary economic discourses.

Chapter 26:

Nationalism is a complex and multifaceted phenomenon that has experienced a resurgence in recent times. Despite the increasing interconnectedness of the world, nationalist movements have emerged in various regions, often tied to religious beliefs. Nationalism revolves around the idea that the political and national unit should align, with a focus on cultural and ethnic criteria. It involves the imposition of a high culture on society, often resulting in linguistic standardization, national identification, and a sense of cultural similarity as the basis for political legitimacy.

National identities are constructed through discourse and social action, constantly renewed, confirmed, or transformed at individual and collective levels. Billig's concept of banal nationalism highlights the everyday

representations of the nation that contribute to a sense of national solidarity and belonging. National identity is a mental construct existing in the imagination of its members, influenced by socialization and creating a "national habitus." National identities are negotiated, co-constructed, and reproduced through discourse, allowing for stability, identification, cohesion, and flexibility.

Border politics play a significant role in national identity politics, often defined by language, ethnicity, and culture. Language policies associated with border politics emphasize the national language as the mother tongue, projecting a homogenous culture and territory. Right-wing populist parties may employ body-politics to conceptualize the nation as a body, symbolizing the national language and excluding minority groups. Nationalism, in this context, is tied to concepts underlying racism but is not necessarily racist, as racism and nationalism can exist independently.

National identities are intertwined with historical narratives that emphasize origins, continuity, tradition, and timelessness. Foundational myths, teleological dimensions, fantasies of purity and homogeneity, and myth memories of golden ages and heroes contribute to the construction of national mythologies. Right-wing populist parties often rewrite national histories to legitimize their agendas and visions, drawing on the past to portray a "pure people" belonging to a defined nation-state.

In conclusion, nationalism is a complex social and political phenomenon that involves the construction of national identities, the negotiation of borders, and the rewriting of national histories. These processes are shaped by discourse, historical narratives, and the interplay of cultural, social, and political factors. Understanding nationalism requires a multidisciplinary approach that considers language, identity, history, and power dynamics.

Chapter 27:

The fusion of politics and media has led to the study of political discourse, including discourses on war, terrorism, and violence. The construction of terrorism is a complex and subjective process influenced by various factors such as historical, cultural, and ideological contexts. Terrorism is a discursive construct that is often difficult to define objectively and is laden with assumptions and biases.

Critical Discourse Analysis (CDA) provides a multi-perspective approach to studying political discourse, focusing on power, ideology, and language as social practice. It aims to investigate complex social phenomena and requires a multidisciplinary and multi-methodological approach.

The discursive construction of terrorism is often used as a tool of propaganda to further specific socio-political goals. An example is the analysis of President George W. Bush's speeches after the 9/11 attacks, which revealed rhetorical strategies and linguistic tools used to shape public understanding of terrorist violence. The speeches were divided into different periods, each characterized by specific discursive constructions and agendas.

During the pre-war period, aggressive rhetoric was used to reassure the public and promise revenge. In the build-up to the war period, the discourse linked terrorism with weapons of mass destruction, creating a sense of imminent threat and the need for immediate action. In the post-war period, the justification for the war shifted to the establishment of democracy and the fight against tyranny.

The discourses of terrorism evolved over time, representing evil, barbarism, possession of weapons of mass destruction, and tyranny. These conceptualizations were influenced by socio-political contexts and served specific political agendas. The changing representations of terrorism highlight the subjective nature of the construct and the power of discursive illusions.

The study of discourses on terrorism and violence requires an integrated methodological approach, considering historical, linguistic, and socio-cultural factors. The relationship between actions and discourses is complex, and no single approach can fully analyze them. The social world is characterized by its complexity and emergent features, requiring a multi-faceted analysis.

In conclusion, the discursive construction of terrorism is a dynamic process influenced by various socio-political factors. CDA offers a valuable framework for analyzing political discourse and understanding the power dynamics and ideological dimensions at play in discourses on terrorism and violence. Future research should continue to explore the nuanced relationship between discourses, social structures, and individual agency in shaping perceptions and actions.

Chapter 28:

1. **Introduction: Race vs. Ethnicity:** Race and ethnicity have traditionally been defined based on biological and sociological factors, respectively. Race refers to physical characteristics, while ethnicity relates to cultural factors. However, in the research field, the term "race" has been replaced by "ethnicity." There is an increasing recognition that race is a social construct and that ethnicity encompasses a broader range of social and cultural identities. The distinction between race and ethnicity is no longer as relevant in CDA, as both terms serve similar analytical purposes.
2. **Elite and everyday racism:** CDA scholars have explored racist ideologies in elite and everyday contexts. Elite racism refers to the reproduction of racist ideologies in institutional settings such as politics, media, and schools. Research has examined how discourse in these contexts marginalizes and exploits certain groups, particularly immigrants and asylum seekers. Everyday racism focuses on the discursive practices used by individuals in non-institutional settings to reinforce stereotypes and prejudices. It highlights how everyday talk normalizes and distances speakers from racism through routine practices such as storytelling or the use of disclaimers.
3. **Overt and covert racism:** In contemporary Western societies, racism has become more covert, making it culturally unacceptable to express direct prejudice. Covert racism is often masked through apparently inclusive keywords such as multiculturalism, diversity, or integration. These keywords indirectly reinforce racial differences while deflecting attention from explicit references to skin color. CDA scholars aim to uncover and make visible these covert forms of racism, which inform different agenda-setting documents and policies.
4. **Integration discourse:** The integration discourse within immigration policy has become an important site of analysis for CDA scholars. They examine how integration is framed as a dual phenomenon, involving both immigrants and host societies. The discourse often emphasizes immigrants' responsibilities for integration while downplaying the responsibilities of host societies. The analysis reveals a hierarchical framework where immigrants' economic rights are contingent upon their compliance with cultural obligations. However, the specific responsibilities for all individuals and institutions remain unspecified, creating a sense of voluntariness rather than binding obligations.
5. **Conclusions:** CDA research on race and racism aims to identify and analyze discursive practices that reproduce social inequalities. It focuses on both overt and covert forms of racism, highlighting the interconnectedness between specific discursive practices and broader ideological systems. CDA scholars seek to understand the conditions that enable dominant racial dynamics and propose ways to challenge and dismantle them.

In summary, race and racism are significant areas of investigation within CDA, as scholars aim to uncover, critique, and challenge discursive practices that perpetuate social inequalities based on racial identities.

Chapter 29:

1. **Introduction to Feminist CDA (FCDA):** FCDA is a political perspective within Critical Discourse Analysis that focuses on investigating the ways in which gender ideologies entrench power asymmetries and become "common sense" in specific communities and discourse contexts. It aims to challenge and demystify discourses that reinforce gendered social orders, hinder social progress, and harm individuals and marginalized groups.
2. **Principles of FCDA:** Five interrelated principles guide FCDA research. Firstly, FCDA recognizes gender as an ideological structure and practice that divides people hierarchically based on presumed natural differences. It acknowledges that gender is fluid, plural, and intersected by other social identities. Secondly, FCDA places power at the center of critical investigations into gender identities and relations. It examines power in terms of hegemonic dominance, systemic inequalities, and the complex network of

disciplinary systems. Thirdly, FCDA shares the constitutive view of discourse with CDA, understanding that language contributes to the reproduction and maintenance of social identities and orders. Fourthly, FCDA emphasizes critical reflexivity, examining how individuals and institutions engage in constructive dialogue and progressive social changes. Finally, FCDA is considered analytical activism, as it seeks to raise critical awareness and contribute to social change.

3. **Studies in feminist CDA: Gendered Dichotomization:** FCDA research has focused on examining the entrenched gendering of public and private spheres in various cultural contexts. Studies have revealed that even in societies where women are encouraged to participate in the public sphere, the private sphere remains primarily associated with women. This division perpetuates traditional gender norms, where men are expected to be breadwinners, and women are responsible for domestic tasks. These gendered norms intersect with racial, cultural, and religious identities, reinforcing patriarchal traditions and safeguarding them against perceived Western lifestyles.
4. **Andro-centricism in organizational structure:** FCDA has investigated the androcentric practices and values that underlie organizational structures, even in contexts where women are active in the workforce. Research has shown that gender mainstreaming initiatives, while promoting more inclusive practices, still face challenges. Women are underrepresented, especially at higher levels of organizations, and those in positions of responsibility constantly face the need to justify their presence and achievements. Androcentric biases persist, where leadership and power are often associated with masculinity. Women in managerial positions may be negatively appraised and face challenges in balancing authority and avoiding perceptions of aggression or lack of confidence. These biases and challenges contribute to social isolation, hinder recognition, and impede women's advancement in the workplace.

In summary, feminist CDA focuses on critically analyzing gender ideologies, power dynamics, and discourses that perpetuate gender inequalities. It aims to challenge and transform gendered social orders, contribute to social justice, and raise critical awareness about the discursive dimensions of gender discrimination. FCDA research explores the intersections of gender with other social identities, examines power relations, and investigates organizational practices to uncover and challenge oppressive structures and promote inclusive and equitable environments.

Chapter 30:

1. **Violence against women:** Feminist discourse scholarship examines the discourse surrounding violence against women, highlighting the institutionally validated sexism present in such discourse. Studies have analyzed news reports and adjudication processes to uncover patterns of victim-blaming and perpetrator mitigation, which perpetuate gender inequalities and legitimize male violence.
2. **Victim-blaming and perpetrator mitigation:** Research by Clark (1992) and Ehrlich (2001) reveals how discourse shifts responsibility for violence onto the victim while excusing the perpetrators. Victim-blaming involves transferring blame to the victim or categorizing them as either "genuine" or "non-genuine" victims based on notions of respectability. Perpetrator mitigation involves minimizing the culpability of the perpetrators by humanizing them or framing their actions as accidents or tragedies. These discursive strategies perpetuate gender stereotypes and inequalities.
3. **New post-feminist gender ideologies:** FCDA studies have also explored newer gender ideologies that have become mainstreamed through popular discourses, which appropriate feminist signifiers. Commodity feminism, as discussed by Talbot (2005) and Lazar (2006, 2009), transforms feminist politics into a consumer lifestyle accessory. Neoliberal postfeminist discourses address women as empowered and entitled consumers, but they often reinforce normative gender ideologies and offer limited visions of femininity and gender equality.
4. **Doing feminist CDA - Case study: Delhi rape case:** An illustrative case study is presented to demonstrate how feminist CDA can analyze the discourse surrounding violence against women. The case study focuses on the internationally publicized "Delhi rape" case, where a young woman was brutally gang-raped on a bus in Delhi. The analysis examines the dominant gender and sexual ideologies at work in the discourse, particularly in relation to victim-blaming and perpetrator mitigation. It shows how respectability and cultural norms are used to blame the victim, while the perpetrators' culpability is downplayed or reframed as a tragedy or accident.

- 5. Conclusions:** The conclusions drawn from the case study highlight the importance of adopting a transnational lens in feminist CDA studies to recognize and challenge global patterns of discourse that sustain gender ideologies. The analysis also emphasizes the need to understand the constellation of power dynamics at work in any given situation, which may involve both pre-feminist elements that resist gender equality and transformative elements that challenge oppressive power relations. Feminist CDA research aims to uncover and critique these power dynamics to advance gender equality and justice.

In summary, the relationship between feminism and CDA involves analyzing the discourse surrounding violence against women, examining patterns of victim-blaming and perpetrator mitigation, and exploring the influence of new post-feminist gender ideologies. Through feminist CDA, researchers aim to uncover oppressive power dynamics, challenge gender inequalities, and contribute to transformative social change.

Chapter 31:

- 1. Introduction to class-related discourse and CDA:** CDA emphasizes the power behind discourse and ideology rather than just persuasion and manipulation. It views discourse as a stake in social struggle and recognizes that social struggle includes class struggle. The aim of CDA is to raise awareness of how language contributes to the domination of certain individuals or social groups by others. It is seen as a step towards social emancipation.
- 2. The concept of class and socio-economic resources:** Class is a multifaceted concept that encompasses various dimensions and resources. Bourdieu's model of class, which has been influential in sociolinguistics and sociology, includes economic resources (property, income, accumulated wealth), sociocultural resources (occupation, education, technological know-how, social contacts, status), behavior (consumption patterns, symbolic behavior, pastimes), life conditions (political life, quality of life, type of neighborhood), and spatial conditions (mobility, dimensions and size of space occupied, type of dwelling). This model helps understand how class and class relations are constituted and indexed in different societies.
- 3. Class and CDA research:** Although class has not been a central focus in CDA research, there has been a growing body of work examining how discourse constructs class and class relations in various domains. For example, researchers have analyzed how public policy talk, media discourse, and political speeches shape perceptions of class. They have examined how welfare-to-work program managers use "class talk" to position welfare recipients and how the media demonize and ridicule the working class. These studies demonstrate the role of discourse in perpetuating or challenging class-based inequalities.
- 4. Class struggles and public discourse:** Class warfare can be pursued not only materially but also through discourse. In Spain, for example, a class-based discursive conflict arose between the conservative government party and the grassroots organization PAH (Platform for those Affected by Mortgages). The PAH campaigns for the right to housing and criticizes the actions of the political class, banks, legal system, and police. This example shows how class-based struggles are manifested in public discourse and how discourse shapes perceptions and actions related to class.
- 5. Conclusions:** There is a need for a more class-centered approach in CDA research that examines materially based inequalities in society. This would involve grounding CDA in political economy and exploring the constructs that emerge in ongoing social events. Some scholars suggest moving towards critical discourse studies (CDS), which incorporate contextually oriented and actor-related analyses and potentially fuse CDA with critical ethnography. It is important to consider the costs and inequalities inherent in a work-centered social order and to broaden the understanding of social citizenship beyond individual responsibility. Discourse analysis is seen as a valuable tool for understanding the politics of welfare reform and how policy changes are framed and given meaning.

In summary, the relationship between class and CDA involves recognizing the power dynamics behind discourse, understanding the multidimensional nature of class, exploring how discourse constructs and perpetuates class-based inequalities, and calling for a more class-focused research agenda within the framework of CDA or related approaches.

Chapter 32:

Critical Discourse Analysis (CDA) has gained significant popularity in educational research in recent years. The number of articles published on CDA and education has seen a significant increase, with researchers from various regions of the world turning to CDA to explore the relationships between educational practices, institutional structures, and societal narratives. CDA research in education has been presented at international conferences and published in numerous journals.

While the early focus of CDA in education was on deconstructing power and oppression, there has been a shift towards a more reconstructive orientation. Scholars have recognized the importance of understanding how more just social relations can be constructed through discourse. This constructive turn in CDA aims to generate agency among students, teachers, and others by providing them with tools to understand how texts position them and generate institutional power relations.

A review of CDA in educational research from 2004-2012 revealed that a majority of studies took a reconstructive orientation, focusing on discourses of learning or transformation. These studies aimed to understand and promote positive educational practices. However, there is still a significant portion of research that focuses on deconstructing discourses that sustain inequalities and reproduce power imbalances.

Examples of CDA studies in education include the analysis of children's periodicals to explore counter-narratives and folk literacies that promote racial pride and cultural development among learners. CDA has also been used to examine how discourse reproduces domination and white privilege in discussions of race. Additionally, researchers have used CDA to explore how educational institutions contribute to the reproduction of class inequalities in late capitalism.

Overall, CDA has provided a critical lens through which educational researchers can analyze and understand the discourses and power dynamics present in educational practices, policies, and materials. The reconstructive orientation of CDA in education aims to foster more equitable and transformative educational practices.

Chapter 33:

The field of Critical Discourse Analysis (CDA) has been applied to the study of textbooks, which are considered a unique resource for exploring the construction of knowledge and the shaping of values, knowledges, and subjectivities among the younger generation. Critical approaches to textbook discourse have reconceptualized textbooks as cultural and political practices that reflect and co-constitute what is considered acceptable in a given time and space.

Textbook analyses from a critical perspective have highlighted various sociological categories of exclusion and marginalization. These include gender inequality, consumerist discourse, nationalist discourse, denial of racism, authoritarian discourse, and more. Such analyses illustrate how dominant societal groups marginalize minority groups and maintain power hierarchies through textbooks. They also reveal the role of textbooks in shaping social, economic, and political ideologies and maintaining the status quo.

Theories of knowledge play a significant role in textbook discourse analysis. Systemic functional linguistics (SFL) and multimodal analysis have been used to explore how disciplinary discourses construct particular epistemologies. SFL examines the role of linguistic features such as naturalization, nominalization, authorial voice, and cause-and-effect relations in textbooks. Multimodal analysis examines how meaning is made through different modes of communication. Critical analyses of history textbooks, for example, have focused on the construction of determinism, evaluation, and legitimization of certain ways of knowing.

Ethnographic discourse analysis is a methodology used in textbook studies. It involves observing and analyzing human interactions in daily life and constructing narratives that resonate with other situations. Ethnographic discourse analysis helps uncover the construction and fissuring of hegemonic formations and provides a deep understanding of textbook discourse.

Textbook production practices involve a complex process that includes curriculum guidelines, formal approval processes, adaptation of previous versions, outsourcing of editing, and author meetings. Textbook authors work within the framework of curriculum guidelines, adapt content, and make decisions based on the state's politics and curricular requirements. The entangled practices in textbook production provide authors with certain authorial freedom but also tie them to curricula, corporate economies, and local politics.

Overall, critical discourse analysis of textbooks sheds light on the cultural and political dimensions of education, the construction of knowledge, and the reproduction of power structures through educational materials. It helps uncover the hidden ideologies and biases present in textbooks and their impact on shaping society and individuals.

Chapter

34:

The relationship between Critical Discourse Analysis (CDA) and media studies is a complex and multifaceted one. Media scholars have been engaging in a form of critical discourse analysis even before CDA became an established identity. The emergence of CDA and its application in media research can be understood within the broader context of media studies.

Media studies examine the political, social, economic, and cultural implications of different mediums and their combined power as "the media." However, the boundaries and location of media studies are not straightforward, as various aspects of society are increasingly conceptualized as "mediated" or "mediatized" objects. This highlights the interconnection between media and the discursive constitution of society. CDA offers a framework to understand the discursive dynamics of media and their impact on society.

CDA's historical emergence in media studies can be traced back to the 1970s and 1980s, when discourse became a central concept in the field. CDA resonated with the theoretical division between political economy and cultural studies in media studies. It combined post-structuralist and Marxist insights and sought to establish credibility among political economy researchers while also appealing to cultural studies scholars. The construction of a theoretical identity for CDA aimed to avoid discursive reductionism and establish its analytical value within the broader field of media studies.

In media studies, CDA has been applied at different levels of analysis. Some research focuses on the structural conventions and ideological functions of media texts, examining the semantic and grammatical properties of different genres and text types. Others explore how media representations normalize certain ways of perceiving the world, performing identity, and constructing social belonging. There is also a focus on the sociological implications of media discourses, analyzing their role in shaping various social phenomena.

The future possibilities of research in CDA and media studies involve expanding the scope of analysis. Researchers should examine the totality of media production, representation, distribution, and reception, including entertainment media and popular culture. Audience analysis can be integrated into discourse studies, exploring how media audiences are discursively constituted and how media discourse influences their behavior. The dynamics of digital media cultures, where audiences are active participants, can be particularly relevant for such analysis.

Media discourse studies should challenge existing divisions between quantitative and qualitative methods and reinvigorate ideology critique. Researchers need to engage with the concept of ideology in media studies and critically analyze the naturalized and contestable understandings of the social world that media perpetuate.

Overall, the relationship between CDA and media studies offers a rich and evolving field of research that explores the discursive dimensions of media, their societal implications, and the dynamics of power and ideology embedded within them.

Chapter 35:

The framework for the analysis of media texts focuses on four key aspects that have been under-researched in the field of discourse analysis: the time plane in discourse analysis, the discursive strategies of social actors, and the extra- and supra-textual effects of mediated discourse.

The time plane in the analysis of journalistic texts has often been overlooked. Understanding the biography of public matters requires a longitudinal examination of mediated texts and their social contexts. Researchers need to consider the time sequence of texts and its implications, as well as the interplay between previous discourses and subsequent ones. Intertextuality has been explored, but it does not provide a comprehensive account of the historicity of discourse. A comprehensive analysis of news discourse should consider both the historical-diachronic perspective, tracing the history of public issues, and the comparative-synchronic perspective, comparing simultaneous discourses.

The discursive strategies of social actors play a crucial role in the construction of media representations of social issues. Journalism relies on the discursive constructions of events, problems, and positions by social actors. Therefore, it is important to examine the discursive strategies employed by social actors in various arenas and channels. Previous discourse analysis has focused on journalists' cognitive processes and textual analysis, neglecting the analysis of social actors' discursive strategies. To gain a comprehensive understanding of media discourse, researchers should analyze the discursive strategies of both social actors and journalists.

The extra- and supra-textual effects of discourse refer to the consequences and impact of texts on the broader discursive field and social realities. While discourse analysis has predominantly focused on the analysis of texts, many of discourse's modes of operation occur beyond or independently of a given text. Media discourse has a significant influence on social and political action, yet studies have not explicitly addressed how media shape social realities beyond the text. The concept of "discursive effects" is proposed to analyze these processes, which include discourse structuration, discourse institutionalization, and closure. Discourse structuration refers to the domination of the terms of the debate, discourse institutionalization involves the transformation of institutional structures and practices, and closure represents the resolution or termination of controversy.

By incorporating these aspects into the analysis of media texts, researchers can develop a more comprehensive understanding of the role of discourse in shaping social and political phenomena.

Chapter36:

Developing an Analytical Framework for Media Discourse involves various steps. Firstly, researchers identify a social problem or issue of interest and collect media texts related to it. A corpus of news texts is formed based on research goals, and an open-ended reading of the texts is conducted to gain a broad understanding. Questions about why certain things are said or not said, how they are said, and what is absent from the texts are explored.

Next, a selection of texts is made using a multi-stage and stratified random sampling process. The selection may include critical discourse moments, which are specific events or occurrences that challenge established discursive positions. Factors such as political activity, scientific findings, or socially relevant events guide the identification of these moments. The analysis can involve comprehensive analysis during selected periods and focused analysis of critical discourse moments.

The analytical framework for media discourse consists of two main components: textual analysis and contextual analysis.

Textual analysis focuses on elements that contribute to the construction of meaning in the text. This includes examining the layout and structural organization of the text, such as the section it is published in and accompanying visual elements. The identification of objects or themes addressed in the text helps understand the role of discourse in shaping realities. Actors mentioned in the text, whether individuals or institutions, are analyzed to understand their representation and framing power. Language, grammar, and rhetoric in the text are also important aspects to consider, including vocabulary choices, writing style, and

persuasive devices used. Discursive strategies employed in the text, such as framing, positioning, legitimation, and politicization, are examined to understand how social actors shape meaning. Ideological standpoints embedded in the text are inferred from these elements and provide insights into motivations and justifications.

Contextual analysis looks beyond the text and examines the overall coverage of an event or issue. Comparative-synchronic analysis involves comparing different representations of the issue in various news outlets to understand the intervention of journalists and reconstruct the discursive strategies of social actors. Historical-diachronic analysis considers the course of social matters and their broader context, as well as the temporal evolution of media discourses. It helps assess the significance of discursive constructions over time and identify historical conditions and context of production.

By applying this analytical framework, researchers can gain a comprehensive understanding of media discourse, its construction of meaning, and its relationship with social issues and contexts

Chapter 37:

Social Media and Critical Discourse Analysis (SM-CDA) focuses on the analysis of discursive practices in social media platforms. Social media refers to web-based and mobile technologies that enable interactive communication and participation. It breaks away from traditional mass media by allowing users to produce and share content, engage in interpersonal and mass communication simultaneously, and have access to institutional and user-generated content.

SM-CDA recognizes the fluid and dynamic nature of discursive power in social media. It explores how social media platforms provide opportunities for individuals to participate, interact, and engage in discursive practices. However, there is also a critique of social media, particularly from a Marxist perspective, which argues that it can exploit users' unpaid labor and serve the interests of corporations. Users' engagement and personal information are commodified for targeted advertising, leading to the accumulation of wealth for corporations.

The critique of social media extends to the notion of democratization and bottom-up discourse formation. While social media platforms can provide spaces for citizen engagement and grassroots access to symbolic resources, they can also be influenced by corporate practices. Many social media spaces operate under commercial funding models, and users' engagement is monetized through advertising and data collection. However, there are also non-profit or anti-capitalist movements that occupy social media spaces.

SM-CDA emphasizes the study of discursive practices in social media, moving away from traditional distinctions between online and offline worlds. It examines how discourse operates across media industries and communication practices. The analysis considers the social and political implications of discourses in social media and aims to understand how they shape and influence society.

In terms of methodology, SM-CDA incorporates approaches from conversation analysis, interactional sociolinguistics, and discourse analysis. It focuses on observing and analyzing communicative practices and their social contexts. The analysis may involve examining textual content, observing users' lives and beliefs, and incorporating multimodal analysis to understand non-verbal communication in social media.

Overall, SM-CDA explores the relationship between social media and discursive practices, recognizing the interplay between technology, discourse, and social context. It seeks to uncover the ways in which social media platforms shape and influence communication, power dynamics, and societal discourses.

Chapter 38:

CDA is an analytical approach that aims to uncover the hidden meanings, power relations, and social ideologies present in media texts. In the case of reality television, CDA focuses on how participants and

their actions are represented through various semiotic resources such as spoken discourse, audio effects, visuals, graphics, and editing techniques.

For instance, CDA examines the conversations and interactions between participants, paying attention to the language used, tone of voice, and the ways in which their words are edited or manipulated. It also analyzes the accompanying audio elements like background music and sound effects, as these contribute to the overall emotional impact and meaning of the show.

Visual aspects, including camera work, angles, and editing choices, are crucial in shaping how participants and their actions are portrayed. CDA looks at how the camera frames individuals, the sequencing of scenes, and the use of editing techniques like cuts and montages to create a specific narrative or impression.

Moreover, CDA investigates the underlying ideologies and values that reality television promotes or challenges. It examines how participants are depicted in relation to societal norms, stereotypes, and power dynamics. For example, it explores whether certain participants are portrayed as more dominant or submissive, or if specific social groups are represented in ways that reinforce or challenge existing hierarchies.

Similarly, in the context of films, CDA extends its analysis to both verbal and nonverbal aspects of communication. It recognizes that even apparently spontaneous spoken language in films is a representational resource that can be scrutinized. Language choices, including code-switching, accents, and dialects, are examined to understand how they contribute to the portrayal of diverse social groups and their identities.

The analysis of films also encompasses the study of visual representations and their ideological implications. CDA scrutinizes the construction of social groups, going beyond traditional sociological variables like race, class, and gender. It investigates the power dynamics and sociocultural meanings conveyed through images, considering how they may reinforce or challenge existing norms and values.

In documentaries specifically, CDA explores the truth claims made by the filmmakers and analyzes how these claims may be influenced by power relations and ideologies. It questions the ways in which reality is constructed and represented through the audio-visual medium.

Overall, CDA provides a critical lens through which reality television and films can be analyzed. It helps uncover the underlying ideologies, power dynamics, and social representations present in these media forms. By examining the language, visuals, and other semiotic resources used, CDA offers insights into how reality TV and films shape and reflect societal discourses, ultimately contributing to our understanding of broader social structures and values.
