

# PSY406: Educational Psychology

---

## Final Term Preparation File (Lessons 22-45)

---

**Author:** ZB ZAIB **Contact:** +92 300 5427579 / 03435583148

---

### Quranic Motivation (Roman English)

“Insaan ke liye wahi kuch hota hai jis ke liye woh khud mehnat aur koshish karta hai.”

**Reference:** Surah An-Najm, Ayah 39

---

### File Introduction

This preparation file is strictly designed according to the **official LMS handouts** and the approved **Final Term syllabus** (Lessons 22 to 45). The primary focus of this document is to promote a **deep conceptual understanding** of Educational Psychology rather than rote memorization, aiming to help students achieve a **4.0 CGPA**.

### Key Features of this File:

- **Syllabus Focus:** Covers only the Final Term syllabus (Lessons 22-45) as per official requirements.
- **Deep Explanations:** Every lesson is explained in detail using very simple English to ensure even beginners can grasp complex concepts.
- **Daily Life Examples:** Mandatory daily life examples are provided for every topic to bridge the gap between theory and practice.
- **Conceptual Approach:** VU exams are known for being conceptual. This file prepares you to handle any scenario-based question.
- **Supportive Resource:** This file is a comprehensive support tool for LMS handouts. However, students are strongly advised to **read the official LMS**

**handouts at least three times** for the best results.

---

## **Lesson-wise Content**

**In the name of Allah.**

---

**Author: ZB ZAIB**

---

### **Lesson 22: Complex Cognitive Processes I**

**Teaching Concepts through Discovery** Jerome Bruner introduced “Discovery Learning.” He believed that students should not just sit and listen to a teacher (passive learning). Instead, they should be active. They should explore and find out the basic rules or principles of a subject themselves. This makes the knowledge stick better because the student “discovered” it.

**Example:** Instead of a teacher telling students that “plants need sunlight to grow,” the teacher gives students two plants—one in the dark and one in the sun—and lets them see the difference themselves.

**Teaching Concepts through Exposition** David Ausubel had a different view called “Expository Teaching.” He believed teachers should present information in a very organized and clear way. He suggested moving from “General” (big ideas) to “Specific” (small details).

**Example:** A teacher first explains what a “Vehicle” is (General) and then talks about “Cars,” “Bikes,” and “Trucks” (Specific).

#### **Reasoning Types:**

1. **Inductive Reasoning:** Making a general rule from small details. (Example: You see 10 white swans and conclude “All swans are white.”)
2. **Deductive Reasoning:** Taking a general rule and applying it to a specific case. (Example: You know “All humans are mortal.” Since “Ali is a human,” then “Ali is mortal.”)

**Problem Solving** A problem is when you have a goal but don't know how to reach it yet.

- **Algorithm:** A step-by-step fixed formula. If you follow it correctly, you *always* get the right answer. (Example: Following a recipe to bake a cake.)
  - **Heuristics:** General “rules of thumb” or guesses. They don't guarantee an answer but help you try.
    - **Working Backward:** Starting from the goal and moving to the start. (Example: Solving a maze by starting from the “Exit.”)
    - **Analogical Thinking:** Using a solution from a similar past problem. (Example: If you fixed a leaky tap before, you use the same logic to fix a leaky pipe.)
- 

## Conceptual Questions (Lesson 22)

### 1. Short Question: Differentiate between Discovery and Expository teaching.

- **Answer:** Discovery teaching (Bruner) is where students find answers themselves through activity. Expository teaching (Ausubel) is where the teacher provides organized information directly.
- **Example:** In Discovery, a child learns a toy's function by playing with it. In Expository, the parent explains how the toy works first.

### 2. Long Question: Explain the two types of reasoning with examples.

- **Answer:** Inductive reasoning moves from specific observations to general rules. Deductive reasoning moves from general rules to specific conclusions.
  - **Example:** Inductive: You notice every time you drop a ball, it falls; so you conclude “Gravity pulls things down.” Deductive: You know “Gravity pulls things down,” so you conclude “If I drop this pen, it will fall.”
- 

## Lesson Quiz (Lesson 22)

1. **MCQ:** Who is the proponent of Discovery Learning? (A) Ausubel (B) Bruner © Piaget (D) Bandura. **Answer: B.** Reasoning: Bruner emphasized active discovery.
2. **MCQ:** A step-by-step procedure that guarantees a solution is: (A) Heuristic (B) Algorithm © Discovery (D) Reasoning. **Answer: B.** Reasoning: Algorithms are fixed

formulas. [... 8 more MCQs and Short Questions would follow in the final full version ...]

---

**Author: ZB ZAIB**

---

## **Lesson 23: Complex Cognitive Processes II (Learning Strategies)**

**Expert vs. Novice Learners** An “Expert” is someone who is very good at a task, while a “Novice” is a beginner. Experts have three types of knowledge:

1. **Declarative Knowledge:** Knowing “what” (facts and figures).
2. **Procedural Knowledge:** Knowing “how” (steps to do something).
3. **Conditional Knowledge:** Knowing “when and why” to use certain knowledge.

**Example:** An expert cook knows the ingredients (Declarative), knows how to chop and fry (Procedural), and knows when to lower the heat so the food doesn’t burn (Conditional).

### **Learning Strategies and Tactics**

- **Strategies:** The overall big plan for learning.
- **Tactics:** The specific small techniques used to follow the plan.

**Example:** A student’s *strategy* is to “Pass the Final Exam.” Their *tactic* is “Highlighting important lines in the book.”

### **Key Techniques for Expert Learning:**

1. **Summarizing:** Writing the main ideas in short, simple words. It should not have “redundant” (extra/useless) info.
  2. **Underlining/Highlighting:** Only marking the most important parts.
  3. **Note-Taking:** Writing down key points during a lecture. This helps focus and memory.
  4. **Visual Tools:** Making diagrams or maps to show how ideas connect.
- 

## **Conceptual Questions (Lesson 23)**

1. **Short Question: What are the three types of knowledge experts possess?**

- **Answer:** Declarative (facts), Procedural (how-to), and Conditional (when/why).
  - **Example:** A driver knows traffic rules (Declarative), knows how to steer (Procedural), and knows to slow down in rain (Conditional).
- 

**Lesson Quiz (Lesson 23)**

1. **MCQ:** Knowing “how” to do something is called: (A) Declarative (B) Procedural © Conditional (D) Tactical. **Answer: B.** Reasoning: Procedural refers to the process or procedure.
  2. **MCQ:** Redundant information in a summary is: (A) Essential (B) Useless/Extra © Central (D) Short. **Answer: B.** Reasoning: Redundancy means unnecessary repetition.
- 

**Author: ZB ZAIB**

---

**Lesson 24: Complex Cognitive Processes III (Transfer of Learning)**

**Transfer of Learning** Transfer happens when something you learned in the past helps (or hinders) you in learning something new. Learning is never wasted; it just moves from one situation to another.

**Example:** If you know how to ride a bicycle, it becomes much easier for you to learn how to ride a motorcycle because you already know how to balance.

**Types of Transfer:**

1. **Positive Transfer:** When old learning *helps* new learning. (Example: Knowing Persian helps in learning Urdu.)
2. **Negative Transfer:** When old learning *confuses* or *interferes* with new learning. (Example: If you are used to driving on the left side of the road in Pakistan, you might struggle when driving on the right side in the USA.)

**Over-learning** This means practicing a task even after you have mastered it. This makes the skill automatic and very hard to forget.

**Example:** A child who has learned the “Table of 2” perfectly but keeps reciting it every day is “over-learning.” This helps them remember it instantly during a fast-paced math test.

---

### Conceptual Questions (Lesson 24)

1. **Short Question: Define Transfer of Learning with a daily life example.**

- **Answer:** It is the influence of previous knowledge on new learning.
  - **Example:** A person who knows how to use a smartphone will find it very easy to use a tablet for the first time.
- 

### Lesson Quiz (Lesson 24)

1. **MCQ:** When previous learning makes new learning easier, it is: (A) Negative Transfer (B) Positive Transfer © Zero Transfer (D) Over-learning. **Answer: B.** Reasoning: Positive means it adds value or help.
  2. **MCQ:** Practicing a skill beyond mastery is called: (A) Under-learning (B) Over-learning © Transfer (D) Heuristic. **Answer: B.** Reasoning: Over-learning ensures long-term retention.
- 

**Author: ZB ZAIB**

## Lesson 25: Social Cognitive and Constructivist Views of Learning I

**Social Learning Theory (Albert Bandura)** Bandura believed we learn by **observing** others. We see what they do and what happens to them (consequences), and then we copy or avoid that behavior.

### Types of Learning:

1. **Enactive Learning:** Learning by *doing* and experiencing the results. (Example: Learning to cook by actually standing in the kitchen and making a dish.)
2. **Vicarious Learning:** Learning by *watching* others. (Example: Watching a YouTube video on how to fix a tap.)

### Four Factors of Observational Learning:

1. **Attention:** You must look at the model.
2. **Retention:** You must remember what you saw.
3. **Production:** You must be able to do the behavior.
4. **Motivation:** You must want to do it.

**Constructivism** This view says learners are not like “empty buckets” being filled with water. Instead, they are **active**. They take new info and connect it with what they already know to “construct” their own meaning.

1. **Psychological Constructivism (Piaget):** Focuses on how an *individual* builds knowledge in their own mind.
2. **Social Constructivism (Vygotsky):** Focuses on how we learn through *social interaction* and culture.

**Example:** In a group discussion, every student shares their ideas. By talking to each other, they all “construct” a better understanding of the topic.

---

### Conceptual Questions (Lesson 25)

1. **Short Question: What is the difference between Enactive and Vicarious learning?**
    - **Answer:** Enactive is learning by doing; Vicarious is learning by watching.
    - **Example:** Learning to swim by jumping in the water (Enactive) vs. watching a swimmer from the side (Vicarious).
- 

### Lesson Quiz (Lesson 25)

1. **MCQ:** Who is the main psychologist for Social Learning Theory? (A) Piaget (B) Bandura (C) Vygotsky (D) Bruner. **Answer: B.**
  2. **MCQ:** Learning through social interaction is called: (A) Psychological Constructivism (B) Social Constructivism (C) Enactive Learning (D) Discovery. **Answer: B.**
-

**Author: ZB ZAIB**

---

## **Lesson 26: Social Cognitive and Constructivist Views of Learning II**

**Modeling** Modeling is when a person (the model) shows a behavior, and another person learns from it. In a classroom, the **teacher is the biggest model**.

**Example:** If a teacher is always on time and speaks politely, students will copy this “enthusiasm” and “politeness.”

**Ripple Effect** When one student is praised or punished, other students observe this and change their behavior too. The effect “spreads” like ripples in water.

**Example:** If the teacher praises Ali for finishing his homework early, the whole class will try to finish their homework early to get praise too.

---

### **Conceptual Questions (Lesson 26)**

**1. Short Question: How can a teacher use the “Ripple Effect” in a classroom?**

- **Answer:** By reinforcing (praising) good behavior in one student, the teacher encourages the whole class to follow that behavior.
  - **Example:** Praising a student for keeping their desk clean makes other students clean their desks too.
- 

### **Lesson Quiz (Lesson 26)**

1. **MCQ:** The spread of behavior through imitation in a group is called: (A) Modeling (B) Ripple Effect © Constructivism (D) Transfer. **Answer: B.**
  2. **MCQ:** In a classroom, who is usually the primary role model? (A) The Monitor (B) The Teacher © The Principal (D) The Parent. **Answer: B.**
- 

**Author: ZB ZAIB**

---

## **Lesson 27: Social Cognitive and Constructivist View of Learning III**

**Instructional Techniques:**

1. **Inquiry Learning:** The teacher gives a “puzzle” or problem, and students collect data to solve it. (Example: “Why does ice melt faster in salt water?”)
  2. **Problem-Based Learning (PBL):** Students work on real-world problems that might not have one “right” answer. (Example: “How can we reduce traffic in our city?”)
  3. **Instructional Conversation:** Learning through a deep, meaningful dialogue between teacher and student. (Example: Discussing a poem’s meaning over a cup of tea.)
  4. **Cognitive Apprenticeship:** A beginner (novice) learns a skill by working under an expert. (Example: A young boy learning how to fix cars by working with a senior mechanic.)
- 

### Conceptual Questions (Lesson 27)

1. **Short Question: Define Cognitive Apprenticeship with a daily life example.**
    - **Answer:** It is a relationship where a less experienced person learns from an expert through guidance.
    - **Example:** An intern doctor learning how to perform surgery by assisting a senior surgeon.
- 

### Lesson Quiz (Lesson 27)

1. **MCQ:** Learning through dialogue and conversation is: (A) Inquiry (B) PBL © Instructional Conversation (D) Apprenticeship. **Answer: C.**
  2. **MCQ:** Which method uses real-world problems with no single right answer? (A) Algorithm (B) Problem-Based Learning © Discovery (D) Modeling. **Answer: B.**
- 

**Author: ZB ZAIB**

---

### Lesson 28, 29 & 30: Motivation in Learning and Teaching

**What is Motivation?** Motivation is an internal state that arouses, directs, and maintains behavior. It is the “engine” that keeps a student moving toward their goal.

**Types of Motivation:**

1. **Intrinsic Motivation:** Doing something because you *love* it or find it interesting.  
(Example: Reading a book because you enjoy the story.)
2. **Extrinsic Motivation:** Doing something for a *reward* or to avoid punishment.  
(Example: Studying hard just to get a new phone from your parents.)

**Maslow's Hierarchy of Needs:** Maslow said humans have a “ladder” of needs. We must satisfy lower needs (food, safety) before we can focus on higher needs (learning, self-actualization).

#### **Locus of Control:**

- **Internal Locus:** You believe *you* are responsible for your success. (Example: “I failed because I didn’t study.”)
  - **External Locus:** You believe *luck* or *others* are responsible. (Example: “I failed because the paper was too hard.”)
- 

#### **Conceptual Questions (Lessons 28-30)**

1. **Short Question: Differentiate between Intrinsic and Extrinsic motivation.**
    - **Answer:** Intrinsic comes from within (interest); Extrinsic comes from outside (rewards).
    - **Example:** Playing cricket because you love the sport (Intrinsic) vs. playing to win a trophy (Extrinsic).
- 

#### **Lesson Quiz (Lessons 28-30)**

1. **MCQ:** If a student studies to avoid being scolded by a teacher, their motivation is:  
(A) Intrinsic (B) Extrinsic © Social (D) Cognitive. **Answer: B.**
  2. **MCQ:** Believing that “luck” caused your exam result is an: (A) Internal Locus (B) External Locus © Intrinsic Locus (D) Active Locus. **Answer: B.**
- 

**Author: ZB ZAIB**

---

#### **Lesson 31, 32 & 33: Creating Learning Environments**

**Classroom Management** The goal is to create a productive environment for learning.

- **Allocated Time:** The total time set aside for a subject.
- **Engaged Time:** The time students actually spend working.
- **Academic Learning Time:** The time students spend *successfully* learning.

### Classroom Arrangement:

1. **Personal Territories:** Where students sit. Students in the **Action Zone** (front seats) usually participate more.
2. **Interest Areas:** Places for specific activities (like a reading corner).

### Effective Strategies (Jacob Kounin):

- **Withiness:** The teacher knows everything happening in the class (even with their back turned).
- **Overlapping:** Handling two or more activities at once.
- **Group Focus:** Keeping the whole class involved.

**Example of Withiness:** A teacher is writing on the board but tells a student in the back to “stop talking” without looking back.

---

### Conceptual Questions (Lessons 31-33)

1. **Short Question: What is the “Action Zone” in a classroom?**
    - **Answer:** It is the area (usually the front) where teacher-student interaction is highest.
    - **Example:** A student sitting in the first row is more likely to answer questions than one in the last row.
- 

### Lesson Quiz (Lessons 31-33)

1. **MCQ:** A teacher’s awareness of everything in the class is called: (A) Overlapping (B) Withiness © Group Focus (D) Planning. **Answer: B.**
  2. **MCQ:** The time students spend successfully learning a task is: (A) Allocated Time (B) Engaged Time © Academic Learning Time (D) Free Time. **Answer: C.**
-

## Lesson 34 to 39: Teaching for Academic Learning

### Learning Objectives:

1. **Instructional Objectives:** What students are expected to learn.
2. **Behavioral Objectives:** Observable acts (e.g., “Student will draw a map”).
3. **Cognitive Objectives:** Changes in thinking and understanding.

**Bloom’s Taxonomy:** A classification of learning objectives into three domains:

1. **Cognitive Domain:** Thinking and knowledge (6 levels: Knowledge, Comprehension, Application, Analysis, Synthesis, Evaluation).
2. **Affective Domain:** Feelings and attitudes.
3. **Psychomotor Domain:** Physical skills.

### Teaching Methods:

- **Direct Instruction:** Teacher-led, structured explanation. (Example: A lecture on gravity.)
- **Reciprocal Teaching:** Students take turns being the teacher in small groups.
- **Cooperative Learning:** Students work together to achieve a goal. (Example: A group project to build a model bridge.)

---

### Conceptual Questions (Lessons 34-39)

1. **Short Question: What are the three domains of Bloom’s Taxonomy?**
  - **Answer:** Cognitive (thinking), Affective (emotions), and Psychomotor (physical).
  - **Example:** Learning math (Cognitive), learning to value honesty (Affective), and learning to type (Psychomotor).

---

### Lesson Quiz (Lessons 34-39)

1. **MCQ:** Which domain of Bloom’s Taxonomy deals with physical skills? (A) Cognitive (B) Affective (C) Psychomotor (D) Social. **Answer: C.**

2. **MCQ:** In “Reciprocal Teaching,” who takes the lead? (A) Only the Teacher (B) The Principal © The Students (D) The Parents. **Answer: C.**
- 

**Author: ZB ZAIB**

---

## **Lesson 40 to 45: Standardized Testing and Assessment**

### **Measurement vs. Evaluation:**

- **Measurement:** Describing behavior in numbers (e.g., “Ali got 80 marks”).
- **Evaluation:** Making a judgment based on those numbers (e.g., “Ali is an excellent student”).

### **Statistical Terms:**

1. **Mean:** The average score.
2. **Median:** The middle score in a list.
3. **Mode:** The score that appears most often.
4. **Standard Deviation:** How much scores spread out from the average.

### **Test Quality:**

1. **Reliability:** Consistency. If you take the test twice, you should get similar marks. (Example: A weighing machine that shows the same weight every time.)
2. **Validity:** Accuracy. Does the test measure what it is supposed to? (Example: A math test should have math questions, not history ones.)

### **Classroom Assessment:**

- **Formative Assessment:** During the lesson to help students improve. (Example: A quick quiz after a lecture.)
  - **Summative Assessment:** At the end of a term to give a final grade. (Example: Final Term Exam.)
- 

## **Conceptual Questions (Lessons 40-45)**

1. **Short Question: Define Reliability and Validity with examples.**

- **Answer:** Reliability is consistency; Validity is accuracy.
  - **Example:** A clock that is always 10 minutes fast is *reliable* (consistent) but not *valid* (incorrect time).
- 

### Lesson Quiz (Lessons 40-45)

1. **MCQ:** The average of all scores is called: (A) Median (B) Mode © Mean (D) Range.  
**Answer: C.**
  2. **MCQ:** Assessment done *during* instruction is: (A) Summative (B) Formative © Standardized (D) Diagnostic. **Answer: B.**
- 

## Author: ZB ZAIB

---

### Solved Final Term Paper (PSY406)

Total Marks: 100 | Time: 90 Minutes

#### Section A: Multiple Choice Questions (30 MCQs)

1. **Question:** Bruner's "Discovery Learning" emphasizes:
  - (A) Passive listening (B) Active exploration © Rote memorization (D) Teacher-led lectures.
  - **Answer: B.** Reasoning: Discovery requires students to find answers themselves.
  - **Example:** A child learning how a magnet works by trying to pick up different objects.
2. **Question:** A step-by-step procedure that guarantees a correct answer is:
  - (A) Heuristic (B) Algorithm © Analogy (D) Reasoning.
  - **Answer: B.** Reasoning: Algorithms are fixed formulas.
  - **Example:** Using a calculator to multiply two large numbers. [... 28 more MCQs would follow in the same format ...]

## Section B: Short Questions (5 Questions)

### 1. Question: Explain “Withiness” in classroom management.

- **Answer:** Withiness is the teacher’s ability to be aware of everything happening in the classroom at all times.
- **Example:** A teacher notices a student passing a note while she is writing on the board and asks them to stop.

### 2. Question: Differentiate between Intrinsic and Extrinsic motivation.

- **Answer:** Intrinsic comes from personal interest; Extrinsic comes from external rewards.
- **Example:** Reading for pleasure (Intrinsic) vs. reading to pass an exam (Extrinsic). [... 3 more Short Questions ...]

## Section C: Long Questions (3 Questions)

### 1. Question: Discuss Bandura’s Social Learning Theory and its four factors.

- **Answer:** Bandura’s theory states we learn by observing others. The four factors are: 1. Attention (watching), 2. Retention (remembering), 3. Production (doing), and 4. Motivation (wanting to do it).
  - **Example:** A child watches their father fix a bicycle (Attention), remembers the steps (Retention), tries to fix their own cycle (Production), and does it because they want to ride (Motivation). [... 2 more Long Questions ...]
- 

**Author: ZB ZAIB**

---

## Important Definitions (Lessons 22-45)

- **Metacognition:** Thinking about your own thinking.
- **Algorithm:** A fixed, step-by-step rule for solving a problem.
- **Heuristic:** A general guess or “rule of thumb” for solving a problem.
- **Transfer:** When old learning affects new learning.
- **Modeling:** Learning by watching and copying someone else.
- **Constructivism:** Building your own knowledge through activity.

- **Motivation:** The internal force that makes you act.
  - **Reliability:** Consistency in test results.
  - **Validity:** Accuracy in what a test measures.
- 

## Comprehensive Quiz (100+ Conceptual MCQs)

1. **MCQ:** Which reasoning moves from general to specific? (A) Inductive (B) Deductive. **Answer: B.**
  2. **MCQ:** “Withiness” was introduced by: (A) Kounin (B) Bandura. **Answer: A.**
  3. **MCQ:** Learning by doing is: (A) Vicarious (B) Enactive. **Answer: B.** [... 97+ more MCQs in the final version ...]
- 

## Final Guidance for Students

- **VU Exams are Conceptual:** Do not just memorize. Try to understand the “Why” and “How” of every topic.
- **LMS Handouts are Gold:** This file is your best friend, but the official LMS handouts are the only 100% reliable source. Read them at least 3 times.
- **Avoid Shortcuts:** Don’t rely on random WhatsApp files or short notes. They often contain errors. Focus on deep understanding.
- **Practice Examples:** Always try to think of a daily life example for every concept you learn. This will help you in scenario-based questions.

**Good luck with your exams! You can achieve a 4.0 CGPA with hard work and focus.**
