

The problems in developing new CALL programs include:

Select the correct option

huge donations

lack of funds

huge funds

lavish funding

developing new

1 of 1

8.5 Evolving Technology

The cost of technology can be a barrier both to getting involved in CALL and maintaining the latest technology. Materials created only a few years ago on one version of an operating system may not function properly or at all on the latest versions. Other problems centre around **developing new** CALL programs, including a lack of funds, expertise and authoring programs.

8.5.1 **Lack of Funds**

The previously mentioned Athena Language-Learning Project (ALLP) project was singular in attracting funding in excess of US\$70 million. Few commercial organizations spend even a fraction of this amount on software development and non-commercial programs are written on far smaller budgets or, more commonly, on no budget at all. Instead, many teachers create software with their own time and resources. In such cases, authors may act conservatively as they are wary of not achieving a return on their investment of time and money.

However, since the ALLP was set up many of the costs of producing quality multimedia have been dramatically reduced. For example, computers have become exponentially more powerful while costs have continued to drop. Now authoring tools and related programs for the creation of graphics, animation and video, which were previously developed from scratch, are commercially available at reasonable prices. However, in an endless cycle, a parallel consumer (e.g. learner) demand for greater sophistication in learning materials usually follows each new capability of these authoring programs so underfunded developers may find it difficult to interest learners.

the empirical qu

1 of 1

observation of working processes, assessment of learning outcomes, and questioning learners about their opinions. Such systematic analysis can help to reveal the extent to which a CALL task engages learners in language at a useful level of difficulty in a way that is appropriate to their individual characteristics.

Level of Linguistic Difficulty

The empirical question about linguistic difficulty is what evidence suggests that the targeted linguistic forms are at an appropriate level of difficulty for the learners? One form of evidence about linguistic difficulty can be found in the type of process data described above those that show the extent of use of interactional modifications. When learners use software that offers help options such as word definitions, their interaction with the materials can be examined to indicate whether they had sufficient interest and need to request definitions (e.g., Chapelle & Mizuno, 1989; Desmarais et al., 1998). If learners read or listen to input without making use of the available help, it is possible that the material is either so easy that no help is needed or that the whole task is so difficult that they are unable to participate at all. If no evidence that learners used help appears in the record log of interactions, it may be that the level of difficulty is

← in front 1 of 1 < >

equipment only as needed, but it is unknown whether this was by pedagogical design or practical necessity.

Storyboard

The storyboard activity Jones and Fortescue (1987) described was used by a group of students who sat together **in front** of a computer screen in a computer lab. 'The text is entirely obliterated, and the learners can see only the title (Superstition), a mass of blobs, a reference to various help features and an invitation to guess a word' (1987: 37). The activity is therefore a guessing game, which is set up as a storyboard containing a text on superstition. The learners work collaboratively through oral conversation to determine what, when, and how they will input words into the game. The conversation among the learners may or may not be conducted in the target language, and the learners are free to take their time producing the language used in the reconstruction.

The language of the task is likely to shift variously from the meaning of the text, the meanings associated with making guesses and arguing about gaming strategy to the forms of the language of the text. The task therefore offers some opportunity for attention to linguistic form, but the degree to which that opportunity is realized should vary depending on the learners and their game strategy. The difficulty level of the language in the storyboard activity described by Jones

designed for be

1 of 1

setting. More-over, the fact that this activity was used each week meant that it was not necessary to spend a lot of time teaching students to use the software relative to the time they spent engaging in the learning activity.

Micro-world

Chun and Brandl (1992) described a micro-world activity **designed for** beginning learners of German: 'The functional goal of this situation is [for the learner] to locate objects in a room and to differentiate between stationary physical location vs. the action or motion involved in placing an object somewhere' (Chun & Brandl, 1992: 260). The task begins by asking the learner to imagine he or she is living in the year 2101 with a robot, who likes to keep the room neat, for a roommate. For the purposes of the task, the student is designated as an untidy person whose things are scattered all over the room. The robot cannot find anything, so he begins to ask

questions such as 'Where did you put my fountain pen?' in the target language, German. The learner, who sees a picture of the messy dormitory room on the computer screen, is expected to answer the robot's questions by typing them on the computer screen in German. After the student

Question # 2 of 10 (Start time: 01:55:07 PM, 28 November 2023)

If CALL software packages are to be properly evaluated and matched with learning needs, they need to be classified by _ _ _

Select the correct option

☐	students
☐	administrator
☒	teachers
☐	computer expert

Click to Save Ans

need to

35 of 53

The model of learning featured in a particular CALL software package is seldom stated, and software packages sold as so-called learning games are often simply highly behaviourist tutorials. If CALL software packages are to be properly evaluated and matched with learning needs, they **need to** be classified by teachers. One way for teachers to do so is by collecting reviews of software from professional publications such as Computer-Assisted Language Learning.

Another, more personalized, way to classify materials is through the creation of in-house reviews, similar to book reviews, which outline key aspects of the program. For example, one might evaluate where a program fits into Chandler's locus of control and suggest how and why a learner might use a particular software program. In a school setting, these reviews might include the reviewer's name so that users take the personal preferences of the reviewer into consideration. In a class-room or self-access learning centre, these reviews could be posted on the board or a website or otherwise made easily available. In these reviews, the teacher should take the role of the editor, having learners engage in critical thinking about the learning materials they are using. This is a particularly important process to undertake when evaluating materials which claim to offer collaborative opportunities but which simply offer shallow cooperative activities in which learners do not **need to** negotiate meaning, the task or the process of finding answers.

8.4 Learning and working styles

Although many online statistical instruments exist for this purpose defining learners' learning styles can be difficult, time-consuming and non-transferable across disciplines. For example, a learner who excels in the rote memorization of baseball statistics may not transfer such skills to mathematics or learning vocabulary. Nor may the skills be appropriate to all subjects and situations such as the learning of creative writing or emergency procedures.

There is also the question of whether a learner's preferred learning style is the most appropriate for learning. Some learners may say they prefer learning passively through a lecture, but may

and personnel

3 of 3

(Warschauer, 2000). With a similar interest in the future of literacies world-wide, Hawisher and Self (2000) have collected empirical studies of language use on the Web in a number of different countries, finding that typically English plays some role along with local languages in Web-based literacy experiences. Lam (2000) documents the development of ESL literacy on the Web through a case-study of a learner who uses English to develop a popular Web page and communicate with a transnational group of peers. These forward-looking studies begin to offer a glimpse of a complex future of language use and learning.

Practicality

Questions about practicality of CALL rely on evidence suggesting that hardware, software, and personnel resources prove to be sufficient to allow CALL to succeed. Assessing the adequacy of resources for all learners has become complex as resources extend beyond the language laboratory and as what is necessary seems to be a moving target. However, given the role of resources for the success of CALL, some formal mechanism needs to be in place to monitor adequacy, and an argument about CALL appropriateness should include a statement about sufficiency of resources.

The metaphor of a computer program as a _____ has been criticized, but since that time assessments of the computer in the classroom have matured and now mostly computer is seen as a complementary tool, not as an alternative.

metaphor

5 of 8

Nunan (1986: 183)

If a computer-based learning environment were to make use of the points outlined above, in particular the use of questions and prompts, a high degree of learner centredness would be possible while, at the same time, guiding learners into good collaborative learning practices. If nothing else, these suggestions warrant further research.

8.2 Pedagogical Concerns for Classroom Practice

This section considers the role of the computer as a kind of virtual teacher, or at least taking the place of the teacher for some functions at some times as learners increasingly engage in autonomous learning. The metaphor of a computer program as a teacher has been criticized, but since that time assessments of the computer in the classroom have matured and most teachers see the computer as a complementary tool, not as an alternative. However, it is necessary to assess the role of computers and computer software within the current model of classroom practice. Different software programs have been variously promoted as a virtual teacher, a teacher's helper, a guide, an instrument, a teaching tool and a learning tool. However, software programs have a long way to go before they can be seen to offer comprehensive effective and efficient language teaching without human intervention.

There may be learning drawbacks through the use of limited metaphors of computer interaction, and that learners may develop false notions by virtue of the interactions they engage in with computers, because of the reinforcing message of these metaphors. In particular, they may get false ideas of

- What computers are?
- Information systems and how they might work?
- Other forms of interaction, such as interaction with other people

Williams (1998: 162-3)

CALL tasks should have a _____ articulated purpose.

Select the correct option

☐	clearly
☐	vague
☒	abstract
☐	ambiguous

should have

1 of 2

CALL should be evaluated through two perspectives: judgmental analysis of software and planned tasks, and empirical analysis of learners' performance.	Methodologies for both types of analyses are needed
Criteria for CALL task quality should come from theory and research on instructed SLA.	CALL evaluators need to keep up with and make links to research on instructed SLA.
Criteria should be applied in view of the purpose of the task.	CALL tasks should have a clearly articulated purpose.
Language learning potential should be the central criterion in evaluation of CALL.	Language learning should be one aspect of the purpose of CALL tasks.

Evaluation as an Argument

Investigations of pedagogical L2 tasks (e.g., Doughty & Williams, 1998; Crookes & Gass, 1993a; 1993b; Skehan, 1998) demonstrate the complex of factors to be considered in designing appropriate tasks for learners. As a consequence, the outcome of task evaluation for any L2 tasks including those for CALL cannot be a categorical decision about effectiveness. Instead, an evaluation has to result in an argument indicating in what ways a particular CALL task is appropriate for particular learners at a given time. In other words, CALL task appropriateness needs to be evaluated on the basis of evidence and rationales pertaining to task use in a particular setting. The idea of evaluation as a context-specific argument rather than a categorical judgement, of course, makes evaluation a complex issue, which needs to be addressed by all CALL users. Evaluation is not only the responsibility of CALL researchers because a justification needs to be an argument concerning the appropriateness of a CALL task for the learners involved at a particular point in time.

detection. The simplest tool a teacher has to check for plagiarism is to type a string of suspect text into a search engine and see whether it leads to one or more websites from which the suspect text may have been taken.

Turnitin <http://writecheck.turnitin.com> – This website essentially automates the above process but additionally, each document that is submitted for plagiarism checking is added to the database. Some teachers shift responsibility for checking for plagiarism by requiring all students to self-check their work with a program such as Turnitin before submitting it.

8.9 Viruses

Viruses are distributed **through the WWW** and email and can destroy files. There are countless viruses in circulation with new ones being added each day. Some viruses end up costing computer users a fortune simply by slowing performance of computers. Others destroy data. It is difficult and sometimes expensive to maintain anti-virus software to handle the latest versions of viruses which, almost by definition, are designed to thwart existing anti-virus programs.

©Copyright Virtual University of Pakistan
126

126 / 157

A virus is a program and, in most cases, must be activated by the user to make it work. Traditionally viruses carried an .exe file name, that is, executable files, but they now have various other suffixes or are contained in files with innocuous .doc or .jpg file formats. A common way to receive such files is through unsolicited email or through the purchase of illegal software. Once a virus enters your computer, it will often spread itself by taking advantage of the address list in an email

A virus is a program and, in most cases, must be activated by the user to make it work. Traditionally viruses carried an .exe **file name**, that is, executable files, but they now have various other suffixes or are contained in files with innocuous .doc or .jpg file formats. A common way to receive such files is through unsolicited email or through the purchase of illegal software. Once a virus enters your computer, it will often spread itself by taking advantage of the address list in an email program, sending a copy of itself with an email to each name on a user's address list.

A certain amount of what is called 'social engineering' is used to make such viruses successful. For example, in 2000, the popular I love you virus featured the subject message: ILOVEYOU. The body of the message was: kindly check the attached LOVELETTER coming from me. Attached to the message is the file LOVE-LETTER-FOR-YOU.TXT.vbs. Many people are variously flattered, surprised or confused about receiving such a message and open the attachment out of curiosity (see <http://www.symantec.com/avcenter/venc/data/vbs.loveletter.a.html> for more information about the Loveletter virus). Sometimes, such messages purport to be anti-virus messages and their attachments are similarly opened.

The Storm worm virus (a worm enters through a computer security loophole and endlessly replicates, crashing the computer) started in January 2007 and, by October, had infected an estimated 50 million computers worldwide.

8.9.1 Thought viruses

Misinformation is one of the greatest challenges on the WWW and in many ways constitutes a

latest technology. Materials created only a few years ago on one version of an operating system may not function properly or at all on the latest versions. Other problems centre around developing new CALL programs, including a lack of funds, expertise and authoring programs.

8.5.1 Lack of Funds

The previously mentioned Athena Language-Learning Project (ALLP) project **was singular** in attracting funding in excess of US\$70 million. Few commercial organizations spend even a fraction of this amount on software development and non-commercial programs are written on far smaller budgets or, more commonly, on no budget at all. Instead, many teachers create software with their own time and resources. In such cases, authors may act conservatively as they are wary of not achieving a return on their investment of time and money.

However, since the ALLP was set up many of the costs of producing quality multimedia have been dramatically reduced. For example, computers have become exponentially more powerful while costs have continued to drop. Now authoring tools and related programs for the creation of graphics, animation and video, which were previously developed from scratch, are commercially available at reasonable prices. However, in an endless cycle, a parallel consumer (e.g. learner) demand for greater sophistication in learning materials usually follows each new capability of these authoring programs so underfunded developers may find it difficult to interest learners.

Topic No: 29

Empirical evaluation of CALL; Evidence for CALL Qualities; Language Learning Potential; Focus on Form; Modified interaction; Modified output

Empirical Evaluation of CALL

Empirical evaluation offers a methodology for making systematic **hypotheses** about the benefits to be attained through CALL tasks. As **hypotheses**, they stand in need of support through empirical data, because as L2 research has shown, 'students are often doing something very different from what [language teachers] assume they are doing' (Hosenfeld, 1976: 123). In other words, it is necessary to identify the observable data that provide evidence of CALL qualities.

Evidence for CALL Qualities

The limitations of the study of learning outcomes have been well-rehearsed in the literature on educational technology (R. E. Clark, 1985; Papert, 1987) as well as in that on CALL (e.g., Doughty, 1987; 1992; Chapelle & Jamieson, 1989; 1991; Dunkel, 1991; Garrett, 1987). The arguments mirror those that have been put forward in other areas of L2 classroom research. Empirical research methods for evaluating L2 classroom tasks have to a large extent given up on evaluating language instruction solely through measurement of learning outcomes in favor of investigating classroom processes.

Despite the definitive move toward the study of learning processes over products, it would be difficult to argue that a research result showing language learning outcomes that can be attributed to particular features of instruction are irrelevant or uninteresting. In a sense, the study of learning outcomes is at the same time seductive and cause for suspicion. This tension can begin to be understood through examination of the qualities outlined above. What becomes apparent is

accomplish something such as making a decision on an issue, or exchanging information to accomplish a goal. Such tasks differ from form-based tasks which might have learners filling in correct verb tenses in a written list of sentences, or changing declarative statements to yes/no questions in an oral drill. Meaning focus is not limited to oral communication tasks, but also can occur during tasks involving reading and writing when learners use the written language purposefully for constructing and interpreting meaning.

Authenticity

The criterion of authenticity indicates the need to develop learners' willingness to communicate but **it also ex** extends beyond the conditions believed important for acquisition. Authenticity refers to the degree of correspondence between an L2 learning task and tasks that the learner is likely to encounter outside the classroom. The choice of pedagogical tasks that learners see as relevant to their language use beyond the classroom should help to engage learners' interest and therefore their willingness to participate. Moreover, current theory of communicative language ability (Bachman, 1990; Bachman & Palmer, 1996) defines it as situation specific, implying that development of ability in language for particular purposes requires practice in using language for those purposes.

Positive Impact

The positive impact of a CALL task refers to its effects beyond its language learning potential. The significance of this quality has been pointed out for assessment tasks (e.g., Bachman & Palmer, 1996), but it is equally important for learning tasks. Ideally classroom language learning tasks teach more than language; they should help learners develop their metacognitive strategies (Oxford, 1990) in a way that will allow them to develop their accountability for their learning in the classroom as well as to learn beyond the classroom. They should engage learners' interest in the target culture in a way that will help develop their willingness to seek out opportunities to communicate in the L2. They should help learners to gain pragmatic abilities that will serve in communications beyond the classroom. An argument concerning positive impact may be based

Click to Save Answer & Move to Next Question

8.5.2 Lack of Expertise

Those creating CALL software programs are often experts in computer programming, design or pedagogy, but are seldom experts in all three fields; while one aspect in a finished program may shine, others may be problematical. Authoring professional software is a labor-intensive enterprise employing the skills of many different people including materials writers, content editors, graphic designers, sound designers, musicians, voice actors, marketers, animators, videographers and so on. A single teacher or group of learners may be disappointed with their efforts when compared with professional products.

One solution in a school context is to assemble a team of experts (or at least people skilled in one or more areas), but even within academic institutions this is not always practical and requires both resolution and organizational skills. This problem is particularly severe in the case of individuals trying to create a small program to solve a local task. A second solution is liaison with commercial publishers, who might help edit and develop locally relevant software packages – as long as doing so does not shift the focus and defeat the purpose of developing learning materials for the local market.

Example 8.2 Online collaborative projects

Creating ‘Call for Participation’ projects

Unless you plan to do the project on your own, you’ll need some partners. Before you ask people to join your project, you need to do some planning. First, create a ‘Call for Participation’ that provides potential participants with an overview of your project. Second, develop the materials that you and your participants will need for the project such as lesson plans and project guidelines.

Call for Participation

as for creating new ones, such as hypertext novels, it is important for learners to be involved in using computers as tools to activate their knowledge by transforming their learning into new media.

Writing the hypertext novel

The non-linear hypertext novel in which the story changes depending on which links one chooses to follow seemed like an attractive alternative to printed literature, but the form has failed, so far, to attract much interest beyond the art world. A pioneer in this field is Michael Joyce who, in 1987, developed the first example, publishing it in 1991. Examples of his work are found at: <http://www.eastgate.com/people/Joyce.html>.

8.7.1 Determining expertise, motivation and roles

When making use of a CALL program, learners need to determine what they know and what they do not know. Learners who take the time to determine what they know about a task and the way of approaching it, if only to acknowledge that they know nothing, are better positioned to engage in an investigation than learners who do not bother to determine their expertise or, in a collaborative situation, misrepresent their expertise to the other learner.

Of course, misrepresenting one's expertise can be an innocent error and one's collaborative partners might also mistakenly bestow one with expertise, but the failure to clear up, or take responsibility for, any such misunderstanding can result in the wrong things being learned and the key learning objectives not being addressed amounts to the same problem.

Similarly, it helps for learners to determine their motivation for completing a task. Good learners develop intrinsic motivation for learning; poor learners decline responsibility for learning and

teacher administration of many classroom activities – a change that has been an ongoing positive impact by the instructor. The activity required a local area network, synchronous communication software, and a teacher who knew how to use it, which apparently were all available in this setting. More-over, the fact that this activity was used each week meant that it was not necessary to spend a lot of time teaching students to use the software relative to the time they spent engaging in the learning activity.

Micro-world

Chun and Brandl (1992) described a micro-world activity **designed for** beginning learners of German: 'The functional goal of this situation is [for the learner] to locate objects in a room and to differentiate between stationary physical location vs. the action or motion involved in placing an object somewhere' (Chun & Brandl, 1992: 260). The task begins by asking the learner to imagine he or she is living in the year 2101 with a robot, who likes to keep the room neat, for a roommate. For the purposes of the task, the student is designated as an untidy person whose things are scattered all over the room. The robot cannot find anything, so he begins to ask

VU

questions such as 'Where did you put my fountain pen?' in the target language, German. The learner, who sees a picture of the messy dormitory room on the computer screen, is expected to answer the robot's questions by typing them on the computer screen in German. After the student provides a correct response (with reference to the picture), the computer replies in German, 'I found it. You put it on top of the TV,' for example. The goal and topic of this and other micro world activities are controlled by the program. If the learner asks the robot where his optical system was designed, or something else outside the defined topic, the computer will not be able to respond.

Conditions for language use in this activity allow for written production, with opportunity for

Which of the following characteristics regarding intelligence differentiates Multiple Intelligence Model from traditional IQ testing model?

Select the correct option

- ☐ Native intelligence
- ☐ Spatial ability
- ☒ Culture-free
- ☐ Conceptual narrowness

Windows taskbar icons: File Explorer, Edge, Word, PowerPoint, VLC, Chrome, Firefox, Teams, OneDrive, Outlook, Mail, Photos, Music, Videos, Settings, Task View, Start Menu, Search, Taskbar, System Tray.

... during tasks involving reading and writing when learners use the written language purposefully for constructing and interpreting meaning.

Authenticity

The criterion of authenticity **indicates the** need to develop learners' willingness to communicate but it also extends beyond the conditions believed important for acquisition. Authenticity refers to the degree of correspondence between an L2 learning task and tasks that the learner is likely to encounter outside the classroom. The choice of pedagogical tasks that learners see as relevant to their language use beyond the classroom should help to engage learners' interest and therefore their willingness to participate. Moreover, current theory of communicative language ability (Bachman, 1990; Bachman & Palmer, 1996) defines it as situation specific, implying that development of ability in language for particular purposes requires practice in using language for those purposes.

Positive Impact

The positive impact of a CALL task refers to its effects beyond its language learning potential. The significance of this quality has been pointed out for assessment tasks (e.g., Bachman & Palmer, 1996), but it is equally important for learning tasks. Ideally classroom language learning tasks teach more than language; they should help learners develop their metacognitive strategies (Oxford, 1990) in a way that will allow them to develop their accountability for their learning in the classroom as well as to learn beyond the classroom. They should engage learners' interest in the target culture in a way that will help develop their willingness to seek out opportunities to communicate in the L2. They should help learners to gain pragmatic abilities that will serve in communications beyond the classroom. An argument concerning positive impact may be based

output, the experience would be expected to seem worthwhile to them. In the setting the authors described, the required equipment and instructor knowledge were present.

Text Analysis

Liou (1993) described **the use of a** grammar checking program in a first-year writing and grammar course for EFL majors at a university in Taiwan. The writing class took a process-oriented approach in which learners were required to write, participate in peer editing, receive comments from the instructor, and revise. The students were given a topic for their writing assignment, for example 'Some Career Tips for College Graduates,' and asked to complete a first draft on their own. The first draft was the object of discussion during the peer editing session which followed. Students were able to use the input from their peers as they pleased when they went to the computer lab to type their first draft that would be handed in. Teachers made general comments on content and organization at this point and identified grammatical problems without specifying the necessary corrections. The students had another opportunity to revise their papers on the computer and then they used the computer for grammar checking. Based on the

Turnitin <http://writecheck.turnitin.com> – This website essentially automates the above process but additionally, each document that is submitted for plagiarism checking is added to the database. Some teachers shift responsibility for checking for plagiarism by requiring all students to self-check their work with a program such as Turnitin before submitting it.

8.9 Viruses

Viruses are distributed through the WWW and email and can destroy files. There are countless viruses in circulation with new ones being added each day. Some viruses end up costing computer users a fortune simply by slowing performance of computers. Others destroy data. It is difficult and sometimes expensive to maintain anti-virus software to handle the latest versions of viruses, which, almost by definition, are designed to thwart existing anti-virus programs.

A virus is a program and, in most cases, must be activated by the user to make it work. Traditionally, viruses carried an .exe file name, that is, executable files, but they now have various other suffixes or are contained in files with innocuous .doc or .jpg file formats. A common way to receive such files is through unsolicited email or through the purchase of illegal software. Once a virus enters

have others. This seems to be confirmed by studies into learner expectations and preferences as well as by classroom research.

Nunan (1986: 183)

If a computer-based learning environment were to make use of the points outlined above, in particular the use of questions and prompts, a high degree of learner centredness would be possible while, at the same time, guiding learners into good collaborative learning practices. If nothing else, these suggestions warrant further research.

8.2 Pedagogical Concerns for Classroom Practice

This section considers the role of the computer **as a kind** of virtual teacher, or at least taking the place of the teacher for some functions at some times as learners increasingly engage in autonomous learning. The metaphor of a computer program as a teacher has been criticized, but since that time assessments of the computer in the classroom have matured and most teachers see the computer as a complementary tool, not as an alternative. However, it is necessary to assess the role of computers and computer software within the current model of classroom practice. Different software programs have been variously promoted as a virtual teacher, a teacher's helper, a guide, an instrument, a teaching tool and a learning tool. However, software programs have a long way to go before they can be seen to offer comprehensive effective and efficient language teaching without human intervention.

There may be learning drawbacks through the use of limited metaphors of computer interaction, and that learners may develop false notions by virtue of the interactions they engage in with computers, because of the reinforcing message of these metaphors. In particular, they may get false ideas of

- What computers are?

inappropriate. These observations of behaviors can be added to by introspective methods requiring learners to think aloud as they work. For example, Park's (1994) study **investigating use** of ESL multimedia through think-aloud data (Ericsson & Simon, 1984) identified revealing thoughts such as 'I think I have a lot of vocabulary that I don't know' (1994: 147). This statement was made while the learner was clicking on one of the words in the input.

Researchers examining process data containing the language that learners produced in CMC tasks have evaluated its linguistic difficulty relative to learners' level of ability. For example, Kern (1995) examined the linguistic characteristics of his students' language in a computer-assisted classroom discussion on family heritage and customs. His analysis of the data concluded that 'students' language output [in the computer-assisted discussion] was of an overall greater level of sophistication than in oral discussion, in terms of the range of morphosyntactic features and in terms of the variety of discourse functions expressed' (1995: 470). He argued for the value of such a task for providing an opportunity to engage in language of an appropriate level of difficulty for his students' development. This argument pertains to the condition of written versus oral; many CMC enthusiasts have argued that the written language of CMC is beneficial for reflection on linguistic form during a meaning-based activity (e.g., Warschauer, 1997b).

Evidence for appropriate difficulty can also be gained through pretesting and post-testing of the language to be acquired during the CALL task. Language that is too difficult or too easy will not produce any changes in learners' language knowledge; however, many other reasons for no pre-post differences may be possible as well.

Individual Characteristics

← ability to | 8 of 10 < >

8.1 Concerns for software development

As already mentioned, traditional materials tend to follow a set scope and sequence that lay down the paths and principles of learning and this is the general route followed by most computer-based learning materials that are, in some cases, adaptations of existing textbooks. However, a strength – and a weakness – of some computer-based materials is their lack of a clearly determined scope and sequence. Instead, they allow individual learners to pursue links which they perceive as being both useful and interesting. This **ability to** choose a path of learning means that different learners are not all constrained to learn the same materials in the same way but may instead find new answers and solutions to questions and problems.

A now common example of this method of learning is a teacher-assigned task that asks learners to use resources on the WWW. The ever-growing WWW consists of billions of individual pages that learners can enter using search engines and links. But learners using the WWW who lack clear direction and proper research and critical thinking skills can often become muddled, distracted and lost in the enormous sea of information.

and personnel

3 of 3

Self (2000) have collected empirical studies of language use on the Web in a number of different countries, finding that typically English plays some role along with local languages in Web-based literacy experiences. Lam (2000) documents the development of ESL literacy on the Web through a case-study of a learner who uses English to develop a popular Web page and communicate with a transnational group of peers. These forward-looking studies begin to offer a glimpse of a complex future of language use and learning.

Practicality

Questions about practicality of CALL rely on evidence suggesting that hardware, software, and personnel resources prove to be sufficient to allow CALL to succeed. Assessing the adequacy of resources for all learners has become complex as resources extend beyond the language laboratory and as what is necessary seems to be a moving target. However, given the role of resources for the success of CALL, some formal mechanism needs to be in place to monitor adequacy, and an argument about CALL appropriateness should include a statement about sufficiency of resources.

task and the language used in other situations of interest outside the classroom. Esling (1991) suggested examining the language of CALL activities in view of Brown and Yule's (1983) classification of discourse used for activities such as giving directions, telling a story, or expressing an opinion. Although Esling's point of comparison was the class of tasks performed in L2 classrooms, the idea of comparison from CALL to other tasks is similar to the authenticity analysis.

Comparing CALL with non-CALL Activities

CALL research attempting such discourse analysis **has examined** learners' oral language as they worked on CALL programs (e.g., Abraham & Liou, 1991), and findings have been mixed. One study described the language of such activities as 'incoherent conversation where there is much clashing of participants and talking simultaneously' (Piper, 1986: 194). The researcher concluded that 'one obvious limitation of this range of language forms is the "here and now-ness" of the tasks, meaning that there is little use of any tense except the present simple' (1986: 197). In contrast, on the basis of a similar study, Mohan concluded that the conversation in which the computer was present was relatively 'context-embedded.' Through examination of the functional sequences in the texts documenting interaction among the learners, he also identified 'episodes of choice, decision-making or problem-solving' consisting of sequences of proposal, agreement, and supporting reasons ± sequences which he interpreted as use of cognitively demanding language. In other words, Mohan interpreted the linguistic experience as positive for L2 development, presumably because these were the types of functions that learners would use beyond the classroom.

The CALL studies examining the language of classroom CMC have also typically chosen classroom language learning tasks as a point of comparison (Warschauer, 1997a; Kern, 1995). However, Chun (1994) suggested implications from her investigation of CMC in a first-year

depend more on extrinsic rewards or ignore intrinsic and extrinsic rewards altogether. Associated with motivation in collaborative situations is the determining of roles for the participants.

A range of different roles is available to learners in a collaborative situation: for example, a leader, a teacher, a follower, a facilitator, a devil's advocate and so on. It is not always necessary for learners to articulate these roles openly and, in fact, the roles of each learner may change over the course of a few turns of conversation. However, when one learner takes a role that excludes the other from collaborative participation, problems may develop in motivation and participation.

Even for learners working on their own on a CALL program, if the program assumes certain roles through the design of its interface, opportunities for participation can be denied the learner.

8.7.2 Determining the working process

Many learners have difficulty in determining the working process. In an intensive study of 20 learners using a new software program (Beatty, 2001), many simply entered into the tasks without any discussion whatsoever. They failed to consider how they might go about examining the tasks, how they might find information to enable them to answer the questions/tasks and, finally, how they might best answer the questions/tasks.

To a certain extent, a failure to engage in critical thinking and, when confronted with partial knowledge, not to engage in scaffolded learning is related to the inability of the learners to determine a working process. The net effect is to reduce collaboration. On the other hand, those who spend time determining the working process, present themselves with more opportunities to progress intelligently through the materials as well as to reduce the social friction that might emerge from misunderstandings that might otherwise arise.

Of course, there are times in a collaborative situation when the task, resources and answers are all so obvious that they do not require any conscious elaboration or determination of the working

particular the use of questions and prompts, a high degree of learner centredness would be possible while, at the same time, guiding learners into good collaborative learning practices. If nothing else, these suggestions warrant further research.

8.2 Pedagogical Concerns for Classroom Practice

This section considers the role of the computer as a kind of virtual teacher, or at least taking the place of the teacher for some functions at some times as learners increasingly engage in autonomous learning. The **metaphor** of a computer program as a teacher has been criticized, but since that time assessments of the computer in the classroom have matured and most teachers see the computer as a complementary tool, not as an alternative. However, it is necessary to assess the role of computers and computer software within the current model of classroom practice. Different software programs have been variously promoted as a virtual teacher, a teacher's helper, a guide, an instrument, a teaching tool and a learning tool. However, software programs have a long way to go before they can be seen to offer comprehensive effective and efficient language teaching without human intervention.

There may be learning drawbacks through the use of limited **metaphors** of computer interaction, and that learners may develop false notions by virtue of the interactions they engage in with computers, because of the reinforcing message of these **metaphors**. In particular, they may get false ideas of

connection between the CALL task and tasks outside the classroom. Addressing the first question requires a comparison between the language that learners engage in during the CALL task and the language used in other situations of interest outside the classroom. Esling (1991) suggested examining the language of CALL activities in view of Brown and Yule's (1983) classification of discourse used for activities such as giving directions, telling a story, or expressing an opinion. Although Esling's point of comparison was the class of tasks performed in L2 classrooms, the idea of comparison from CALL to other tasks is similar to the authenticity analysis.

Comparing CALL with non-CALL Activities

CALL research attempting such discourse analysis has examined learners' oral language as they worked on CALL programs (e.g., Abraham & Liou, 1991), and findings have been mixed. One study described the language of such activities as 'incoherent conversation where there is much clashing of participants and talking simultaneously' (Piper, 1986: 194). The researcher concluded that 'one obvious limitation of this range of language forms is the "here and now-ness" of the tasks, meaning that there is little use of any tense except the present simple' (1986: 197). In contrast, on the basis of a similar study, Mohan concluded that the conversation in which the computer was present was relatively 'context-embedded.' Through examination of the functional sequences in the texts documenting interaction among the learners, he also identified 'episodes of choice, decision-making or problem-solving' consisting of sequences of proposal, agreement, and supporting reasons ± sequences which he interpreted as use of cognitively demanding language. In other words, Mohan interpreted the linguistic experience as positive for L2 development, presumably because these were the types of functions that learners would use beyond the classroom.

The CALL studies examining the language of classroom CMC have also typically chosen classroom language learning tasks as a point of comparison (Warschauer, 1997a; Kern, 1995). However, Chun (1994) suggested implications from her investigation of CMC in a first-year

Empirical evaluation of CALL; Evidence for CALL Qualities; Language Learning Potential; Focus on Form; Modified interaction; Modified output

Empirical Evaluation of CALL

Empirical evaluation offers a methodology for making systematic hypotheses **about the** benefits to be attained through CALL tasks. As hypotheses, they stand in need of support through empirical data, because as L2 research has shown, 'students are often doing something very different from what [language teachers] assume they are doing' (Hosenfeld, 1976: 123). In other words, it is necessary to identify the observable data that provide evidence of CALL qualities.

Evidence for CALL Qualities

The limitations of the study of learning outcomes have been well-rehearsed in the literature on educational technology (R. E. Clark, 1985; Papert, 1987) as well as in that on CALL (e.g., Doughty, 1987; 1992; Chapelle & Jamieson, 1989; 1991; Dunkel, 1991; Garrett, 1987). The arguments mirror those that have been put forward in other areas of L2 classroom research. Empirical research methods for evaluating L2 classroom tasks have to a large extent given up on evaluating language instruction solely through measurement of learning outcomes in favor of investigating classroom processes.

Despite the definitive move toward the study of learning processes over products, it would be difficult to argue that a research result showing language learning outcomes that can be attributed to particular features of instruction are irrelevant or uninteresting. In a sense, the study of learning outcomes is at the same time seductive and cause for suspicion. This tension can begin to be understood through examination of the qualities outlined above. What becomes apparent, is that some of the qualities (e.g., language learning potential) might best be studied by examining

used by a group

1 of 1

be constrained by some limited access to the computer equipment as the learners were scheduled carefully to proceed through the assigned steps of the composing process, using the computer equipment only as needed, but it is unknown whether this was by pedagogical design or practical necessity.

Storyboard

The storyboard activity Jones and Fortescue (1987) described was **used by a group** of students who sat together in front of a computer screen in a computer lab. 'The text is entirely obliterated, and the learners can see only the title (Superstition), a mass of blobs, a reference to various help features and an invitation to guess a word' (1987: 37). The activity is therefore a guessing game, which is set up as a storyboard containing a text on superstition. The learners work collaboratively through oral conversation to determine what, when, and how they will input words into the game. The conversation among the learners may or may not be conducted in the target language, and the learners are free to take their time producing the language used in the reconstruction.

The language of the task is likely to shift variously from the meaning of the text, the meanings associated with making guesses and arguing about gaming strategy to the forms of the language of the text. The task therefore offers some opportunity for attention to linguistic form, but the degree to which that opportunity is realized should vary depending on the learners and their game strategy. The difficulty level of the language in the storyboard activity described by Jones

view of the classroom teacher, knowing the model of instruction can help moderate their own and the learners' expectations of the software program's organization and tasks.

The model of learning featured in a particular CALL software package is seldom stated, and software packages sold as so-called learning games are often simply highly behaviourist tutorials. If CALL software packages are to be properly **evaluated** and matched with learning needs, they need to be classified by teachers. One way for teachers to do so is by collecting reviews of software from professional publications such as Computer-Assisted Language Learning.

Another, more personalized, way to classify materials is through the creation of in-house reviews, similar to book reviews, which outline key aspects of the program. For example, one might evaluate where a program fits into Chandler's locus of control and suggest how and why a learner might use a particular software program. In a school setting, these reviews might include the reviewer's name so that users take the personal preferences of the reviewer into consideration. In a class-room or self-access learning centre, these reviews could be posted on the board or a website or otherwise made easily available. In these reviews, the teacher should take the role of the editor, having learners engage in critical thinking about the learning materials they are using. This is a particularly important process to undertake when evaluating materials which claim to offer collaborative opportunities but which simply offer shallow cooperative activities in which learners do not need to negotiate meaning, the task or the process of finding answers.

8.4 Learning and working styles

8.5.2 Lack of Expertise

Those creating CALL software programs are often experts in computer programming, design or pedagogy, but are seldom experts in all three fields; while one aspect in a finished program may shine, others may be problematical. Authoring professional software is a labor-intensive enterprise employing the skills of many different people including materials writers, content editors, graphic designers, sound designers, musicians, voice actors, marketers, animators, videographers and so on. A single teacher or group of learners may be disappointed with their efforts when compared with professional products.

One solution in a school context is to assemble a team of experts (or at least people skilled in one or more areas), but even within academic institutions this is not always practical and requires both resolution and organizational skills. This problem is particularly severe in the case of individuals trying **to create a** small program to solve a local task. A second solution is liaison with commercial publishers, who might help edit and develop locally relevant software packages – as long as doing so does not shift the focus and defeat the purpose of developing learning materials for the local market.

Example 8.2 Online collaborative projects

Creating 'Call for Participation' projects

Unless you plan to do the project on your own, you'll need some partners. Before you ask people to join your project, you need to do some planning. First, create a 'Call for Participation' that provides potential participants with an overview of your project. Second, develop the materials that you and your participants will need for the project such as lesson plans and project guidelines.

Call for Participation

A 'Call for Participation' should have the following elements:

- Topic/Title:
- Content/Curriculum areas:

need to be fa

1 of 1

criteria and theory need to apply not only to software, but also to the task that the teacher plans and that the learner carries out.

As a way of addressing these needs, a perspective is explained through five principles of evaluation developed by analogy to principles for evaluation of language assessments as described in Chapter. Even though the purpose of language testing is different than that of instructional tasks, at a general level, perspectives on evaluation of assessment tasks are also applicable to CALL tasks. Table 3.2 summarizes these principles.

Table 1. Summary of principles for evaluating CALL

Principle	Implication
Evaluation of CALL is a situation-Specific argument.	CALL developers need to be familiar with criteria for evaluation which should be applied relative to a Particular context.

CALL should be evaluated through two perspectives: judgmental analysis of software and planned tasks, and empirical analysis of learners' performance.	Methodologies for both types of analyses are needed
Criteria for CALL task quality should come from theory and research on instructed SLA	CALL evaluators need to keep up with and make links to research on instructed SLA

Results from many _____environments show features of simplified registers such as omission of subject pronouns, articles as well as use of contractions and abbreviations.

Select the correct option:

- ☐ Non communicative
- ☐ Computer mediated communication (CMC)
- ☐ Traditional Class communication
- ☐ Face to Face communication

show fe

1 of 1

research methods; positive impact; practicality

Research Methods

The study of CMC outside the L2 classroom has been developed over the past decade by researchers hoping to characterize the registers of language use in e-mail, chat rooms, electronic bulletin boards, and discussion lists, for example (Ferrara, Brunner, & Whittemore, 1991; Murray, 1991; Self & Meyer, 1991). Results from many CMC environments show features of simplified or reduced registers such as omission of subject pronouns, articles, and the copula, as well as use of contractions and abbreviations. Research has identified a large number of the words 'you' and 'I' in the texts, and a large number of WH and yes/no questions. This research begins to reveal the character of CMC, or 'interactive written discourse,' as a point of comparison for some CALL tasks.

It is therefore useful to have a means of register analysis which frames a description of registers in a way that captures the aspects of language use of interest to L2 researchers. In particular, the features of interest are those associated with the input that is provided to the learner, the learner's output, and the interaction between the learner and interlocutor. Each of these aspects of the language can be analyzed in greater detail through five descriptive categories: pragmatic function, linguistic characteristics, quantity, non-linguistic moves and forms, and medium (Chapelle, 1999a). The questions one would use to conduct an analysis of L2 input, output, and interaction are in Table 3.8. The descriptions of language from the CALL task and from the language of interest outside the classroom provide the data needed to make a comparison of the two ± a comparison which speaks to the degree of authenticity of the CALL task relative to another identified context.

This methodology for systematic examination of CALL task authenticity demonstrates the complexity of the authenticity construct as well as the need for empirical research examining the extent to which the language engendered in CALL tasks is authentic relative to a particular register of interest. In other words, authenticity needs to be considered in a more-or-less fashion rather than as an all-or-nothing attribute of a task, and it needs to be considered relative to a

☐	Teacher fit

Chemist

support, surprise, control, and stakes $\pm$ need to be considered in an argument for language learning potential. This list of conditions will no doubt change as additional research sheds light on these and other factors. Moreover, the complete meaning of language learning potential will develop as theory and research in SLA develop, but past research and theory-based predictions suggest that Skehan's list warrants serious consideration for the time being.

Learner Fit

Whereas language learning **potential captures** the findings concerning general processes, learner fit takes into account the individual differences in linguistic ability level and non-linguistic characteristics.

Skehan suggests that the teacher choose tasks that will provide learners an opportunity to work with a range of target structures appropriate to their level. If the language of a CALL task is already known to the learner, the task presents no opportunity for development; language that is

beyond the learners' grasp relative to their ability, is not useful either. Learner characteristics such as willingness to communicate, age, and learning style also come into play in task choice.

Meaning Focus

The importance of meaning focus in language learning tasks may go without saying, but in order to underscore the dual goals of focus on form during completion of a meaning-focused task,

Question # 3 of 10 (Start time: 03:01:29 PM, 27 November 2023)

----- project was singular in attracting funding in excess of US\$ 70 million.

Select the correct option

☐	TEFL
☐	NASA
☒	CALL
☐	ALLP

project was

2 of 2

8.5 Evolving Technology

The cost of technology can be a barrier both to getting involved in CALL and maintaining the latest technology. Materials created only a few years ago on one version of an operating system may not function properly or at all on the latest versions. Other problems centre around developing new CALL programs, including a lack of funds, expertise and authoring programs.

8.5.1 Lack of Funds

The previously mentioned Athena Language-Learning Project (ALLP) **project was** singular in attracting funding in excess of US\$70 million. Few commercial organizations spend even a fraction of this amount on software development and non-commercial programs are written on far smaller budgets or, more commonly, on no budget at all. Instead, many teachers create software with their own time and resources. In such cases, authors may act conservatively as they are wary of not achieving a return on their investment of time and money.

However, since the ALLP was set up many of the costs of producing quality multimedia have been dramatically reduced. For example, computers have become exponentially more powerful while costs have continued to drop. Now authoring tools and related programs for the creation of graphics, animation and video, which were previously developed from scratch, are commercially available at reasonable prices. However, in an endless cycle, a parallel consumer (e.g. learner) demand for greater sophistication in learning materials usually follows each new capability of these authoring programs so underfunded developers may find it difficult to interest learners.
