(ENG 511) Final TERM FILE COMPILE BY AMEER in Easy concepts...

Q. Define language learning. (Imp)

Language learning is an active process that begins at birth and continues throughout life. Language learning means understanding and using a new language through studying, practicing, and getting help from teachers or books. Unlike how children naturally learn their first language, language learning usually needs effort, time, and proper teaching in a classroom or with a guide.

In simple it means learning language through deliberate efforts and practice.

Q. Define language shock. (imp)

Language shock is the feeling of confusion and discomfort a person has when they are in a place where a new language is spoken. It is often part of the silent period in second language acquisition, where learners initially struggle to process and produce the new language.

Q. What is meant by language awareness in learning a second language?

Language awareness means noticing and understanding how a language works. When learning a second language, it helps you pay attention to grammar, sentence structure, and cultural meanings. This awareness makes it easier to learn and use the language correctly.

In simple it means awareness about the language sentence, structure and meaning that help in learning a language.

Q. Explain habitual thought. (imp)

Habitual thought means the usual way people think about things in daily life. It includes how we notice, remember, and understand what happens around us. These thoughts are automatic and come from our regular habits, unlike special thinking that we learn for specific tasks or subjects.

Q. Define the interface between mass nouns and count nouns. (imp)

Things we can count one by one (count nouns) and things we cannot count directly (mass nouns). The distinction between mass nouns and count nouns affects cognition and language structure. In English, mass nouns cannot be pluralized directly but can be counted through expressions like "buckets of sand".

Q. Explain duality patterns in language. (Imp)

Duality of patterning refers to the linguistic principle that language operates at two levels:

- Phonemes (basic sound units) combine to form

Compiled by Ameer

❖ Morphemes (meaningful units of language)

Q. What is the interface between first and second language acquisition? (imp)

The interface between first and second language acquisition means how learning your first language affects how you learn a second language. Sometimes, your first language helps you understand the new one, but other times it can cause confusion or mistakes. This connection is called transfer or interference.

Q. List three ways of feeling associated with anxiety. (imp)

❖ Physical tension ❖ Mental distress ❖ Reduced cognitive performance

Q. What is the constructivist approach to motivation?

The constructivist approach to motivation emphasizes that learning is an active, constructive process where learners build their understanding through experiences and social interactions.

Q. List the key elements of culture. (imp)

❖ Language ❖ Traditions ❖ Beliefs ❖ Social norms ❖ Art and literature

Q. What are three inadequacies of the idea that "language is essential for thought"?

- Some thinking happens without language:
- People without language can still think:
- Feelings and ideas can exist before words

Q. Differentiate between sequential bilingualism and simultaneous bilingualism. (imp)

Simultaneous Bilingualism: - This happens when a child learns two languages at the same time from a very young age. This usually happens in families or communities where both languages are used every day.

Example: A child who hears both English and Urdu at home from birth will grow up learning both together.

Sequential Bilingualism: - This happens when a person learns one language first and• then learns a second language later. This is also called second-language learning and can happen at any age child or adult.

Example: A child who speaks only Urdu at home and then starts learning English at school.

Q. Name three sound-based languages.

❖ English ❖ French ❖ Spanish

Compiled by Ameer

Q. What is the difference between induction and explication? (imp)

- **Induction:** Learning by seeing examples and then figuring out the general rule.
  Example: If you see that cats, dogs, and cows all have four legs, you learn that most animals have four legs.
- **Explication:** Learning through clear and direct explanation from a teacher or guide.
  Example: A teacher tells you that "verbs are action words" — this is explication.

Q. Define content words vs. functional words. (imp)

❖ Content words: These are words that carry the main meaning in a sentence like nouns, verbs, adjectives.

❖ Functional words: These are words that help connect sentences and show grammar, but they don't carry much meaning on their own like prepositions, conjunctions.

Q. What is alexia? (imp)

Alexia is a neurological disorder causing the inability to read despite normal vision.

Q. What are the two main branches of constructivism?

❖ Cognitive constructivism (Piaget)

❖ Social constructivism (Vygotsky)

Q. What are the main factors in reading disorders? (imp)

❖ Phonological processing issues ❖ Visual processing difficulties ❖ Cognitive deficits

Q. Define whole-word recognition. (imp)

Whole-word recognition refers to the ability to recognize words as whole rather than decoding them letter by letter.

Q. What is meant by language politics? (imp)

Language politics means the decisions and actions taken by governments or institutions about which languages should be used, taught, or given importance. It includes promoting some languages, limiting others, or making rules about official languages in schools, media, or government.

Q. What is the term for the removal of a damaged part of the brain?

The term is lobectomy or lesion removal surgery.

Compiled by Ameer

Q. List four qualities associated with physical learners. (imp) characteristics of physical learner

❖ Preference for hands-on activities ❖ Strong coordination and movement skills ❖ Learning best through physical interaction ❖ Engaging in role-playing and experiments.

Q. Define dichotic listening tasks. (imp)

Dichotic listening tasks are tests where a person hears different sounds in each ear at the same time through headphones. These tasks help researchers understand which side of the brain is more active or stronger in processing sounds, especially language.

Q. What are the four dichotomous learning styles? (imp)

❖ Visual vs. Verbal ❖ Active vs. Reflective ❖ Sequential vs. Global ❖ Sensing vs. Intuitive

Q. What is taxonomy bias? (imp)

Taxonomy bias refers to the tendency to categorize objects and concepts based on hierarchical classifications rather than functional relationships.

Or

Taxonomy bias refers to the tendency to categorize objects and concepts based on hierarchical classifications rather than functional relationships.

Q. What are social strategies that affect second language acquisition?

❖ Interaction with native speakers ❖ Participating in group discussions ❖ Engaging in cultural immersion

Q. What is the difference between a pidgin and a creole? (imp)

Pidgin: A **pidgin** is a simple and mixed language that people create to talk to each other when they don't speak the same language. It has basic grammar and limited words. It is **not** anyone's first language.

 Example: Traders from different countries use a mix of languages to understand each other.

Creole: A **creole** is a **complete language** that comes from a pidgin. When children grow up learning that pidgin as their first language, it becomes a creole. It has full grammar and vocabulary like any natural language.

 Example: If a pidgin becomes the main language of a community and kids speak it from birth, it turns into a creole.

Compiled by Ameer

Q. Enlist three psychological disorders related to reading.

❖ Dyslexia ❖ Hyperlexia ❖ Reading comprehension disorder

Q. What are the symptoms and characteristics of conduction aphasia? (imp conduction aphasia)

Conduction aphasia is a type of language problem that happens after brain damage. People with this condition have the following signs:

Main symptoms:

1. **Good understanding**:
   The person can hear and understand what others say.
2. **Fluent speaking**:
   They can speak in full sentences with correct grammar and flow.
3. **Speech mistakes**
   Sometimes, they mix up sounds in words.
4. **Trouble repeating words or sentences**:
   They can't repeat exactly what someone says, even though they understand it and can say the same idea in different words.

People with conduction aphasia speak fluently and understand well, but they **struggle to repeat words exactly** and may make small mistakes in how words sound.

Q. What are the symptoms of learning disorders, specifically dyslexia? (imp)

Dyslexia is a learning difficulty that mainly affects reading and writing. It is not related to intelligence but makes it harder for a person to read, spell, and understand words.

Simple Symptoms:

1. Trouble with sounds in words:
2. Spelling problems:
3. Slow reading and poor fluency:
4. Weak understanding while reading (poor comprehension):
5. Difficulty recognizing words quickly (word decoding):
6. May also struggle with writing or math:

Q. What is the role of inhibition in language learning? (imp)

Definition:
Inhibition is the mental ability to block or ignore unnecessary or distracting information.

Explain:
In language learning inhibition helps learners focus on the correct words and grammar by blocking out confusing language rules. It is especially useful when learning a second language,

Compiled by Ameer

as it prevents interference from the first language. This allows the learner to better understand and use the new language accurately.

Q. Define interference in language learning and its effects on second language acquisition.

Interference occurs when features of a learner's first language negatively impact the learning of a second language. This can lead to errors in grammar, pronunciation, and vocabulary as learners apply their native language rules to the second language.

Q. What is the order of acquisition in the language acquisition process? (imp)

The **order of acquisition** is the natural sequence in which language learners pick up grammar rules and language features over time.

Explanation:
In the language learning process some grammar structures are learned earlier than others and this pattern is usually the same for most learners. For example, simple sentence forms are often learned before more complex ones. This order is influenced by how the brain develops and how easy or hard the language features are to understand and use.

Q. What are the characteristics of simultaneous learning in second language acquisition?

Simultaneous learning in second language acquisition means learning two languages at the same time from birth or very early childhood.

Characteristics:

- The child is exposed to two languages from birth or early childhood, often in a natural setting like home or school.
- Both languages grow together in the child's mind, supporting overall cognitive and language development.
- The child may switch between the two languages while speaking, depending on the situation or words they know best.

Compiled by Ameer

Q. Explain the critical period hypothesis and its two components. (imp)

The **Critical Period Hypothesis** suggests that there is a special time in early childhood when the brain is best able to learn a language. If language learning starts after this time it becomes much harder to achieve language fluency.

Components:

1. The **neurobiological component** means that the brain is more flexible in early years, which helps children learn language easily. As people get older the brain becomes less flexible, making it harder to learn new languages.

2. The **behavioral component** shows that language learners who start after this critical period often struggle with pronunciation and grammar. This means they may never sound like native speakers or fully grasp complex language rules if they begin learning too late.

Q. How does the theory of "language is essential for thought" explain cognition? (imp)

The theory **"language is essential for thought"** means that **we need language to think properly**. According to this idea our thoughts are shaped by the words and grammar we know. So, if we didn't have language, we wouldn't be able to think clearly or deeply.

But some people **disagree** with this. They say that even without language people like deaf children or even smart animals can still solve problems and understand things. This shows that language helps thinking but it might not be the only way we can think.

Q. What is the criticism of the Whorf hypothesis?

The **Whorf hypothesis** says that the language we speak shapes the way we think. But many people have **criticized** this idea for the following reasons:

1. **Too much focus on language**:
2. **Hard to prove**:
3. **Ignores personal and cultural differences**:

Q. Explain Noam Chomsky's concept of UG (Universal Grammar) and LAD (Language Acquisition Device). (imp)

Noam Chomsky's concept of **Universal Grammar (UG)** and the **Language Acquisition Device (LAD)** explains how humans are naturally able to learn language.

According to Chomsky, all humans are born with a set of grammatical rules in their minds known as **Universal Grammar**. This means that all languages share some basic structure and our brains are already prepared to understand these common rules.

The Language Acquisition Device (LAD) is a mental tool in the brain that helps children learn their native language quickly and naturally. When children hear people speaking around them the LAD helps them recognize patterns and apply the rules of the language without needing to be directly taught. This theory suggests that the ability to learn language is innate and universal in all human beings.

Universal Grammar (UG):

It is the idea that **all humans are born with a basic understanding of grammar** that is common to all languages.

Language Acquisition Device (LAD):

Compiled by Ameer

It is a **natural ability in the brain** that helps children **learn language quickly** just by hearing it around them.

Q. What is Zipf's law, and how does it apply to linguistic studies? (imp)

Zipf's law states that there is an inverse relationship between the frequency of a word's use and its length: commonly used words tend to be shorter. For example, common words like “I,” “you,” “the,” and “is” are very short but used very frequently.

This law is important in linguistic studies because it shows how languages become more efficient over time. By using shorter words more often, speakers can communicate faster and with less effort. This helps make communication smoother and easier for everyone.

Q. How does cognitive control influence language learning?

Cognitive control helps language learning by allowing a person to **focus, remember important information, and ignore distractions**. It plays a key role in learning grammar rules, understanding sentence structure, and avoiding confusion from the first language when learning a new one. For example, when someone is learning English but already speaks Urdu, cognitive control helps them **stop old language habits** from interfering with the new language. It also helps them **stay focused on what they’re learning**, especially when the language rules are difficult. In short, cognitive control makes it easier to **understand, use, and remember** a new language properly.

Q. What are the three classes of variables in language acquisition?

The three classes of variables are:

1. Linguistic variables: Properties of the language being learned.

2. Learner variables: Individual differences like age, motivation, and cognitive abilities.

3. Environmental variables: The quality and quantity of exposure to the target language.

Q. What are the psychological factors affecting language learning? (imp)

Psychological factors are mental and emotional elements that can affect how well a person learns a language it include:

❖ **Motivation:** When learners are motivated they try harder and stay committed which helps them learn faster and better.

Compiled by Ameer

❖ **Anxiety:** Feeling nervous or stressed can block learning and memory making it harder to speak or understand a new language.

❖ **Attitude:** If a learner has a positive attitude toward the language and its culture they are more open to learning and enjoy the process more.

❖ **Cognitive style:** This refers to a person's way of thinking and learning. Some people learn better through visuals others through listening or practice and this affects how they understand and use the language.

Q. Describe the cognitive role in second language acquisition.

The **cognitive role** in second language acquisition refers to how the mind helps in learning a new language. It includes important mental processes like memory, attention, and problem-solving. These processes help learners notice and organize new words and grammar, recognize patterns**,** and apply language rules correctly. Good cognitive skills also help learners remember what they learn**,** avoid confusion with their first language**, and** understand difficult parts of the new **language**. In short, cognition helps learners take in, understand, and use the second language more effectively.

Q. How do Vygotsky and Piaget differ in their views on cognition?

- **Piaget** believed that thinking comes first and language comes later. He said children go through **stages** of thinking develop**ment**, and after that, they start using language.

- **Vygotsky** believed the **opposite**: he said **language** comes first and helps children think better. He believed that talking with others helps children learn and develop their minds.

Q. What are explicit learning strategies, and how do they differ from implicit ones? (imp)

Explicit strategies are when you know you're learning something. For example when you study grammar rules or make flashcards. You are actively trying to learn step by step.

Implicit strategies are unconscious you learn just by **listening, reading, or practicing** without thinking too much about the rules.

Q. What are the qualities of visual, social, and interpersonal learners? (Ask any one of them imp)

- **Visual learners**: Learn best by seeing like pictures, diagrams, or videos.
- **Social learners**: Learn better by being in groups and talking with others.
- **Interpersonal learners**: Are good at working with people, understanding feelings and communicating well.

Compiled by Ameer

Q. What are three factors essential for language production and perception?(imp)

1. **Memory** – To remember words and grammar rules.
2. **Attention** – To focus on what you hear or read without getting distracted.
3. **Cognitive Processing** – To understand the meaning and make sense of what you hear or say.

Q. What is the role of the right hemisphere in language production and speech?(imp)

The right side of the brain helps us understand the **t**one of voice, emotions, and creative language like jokes or metaphors. It works with the left side to make communication more natural and expressive.

Q. Define lateralization and its implications for language processing. (imp)

Lateralization means that the two sides of the brain have different jobs.

- The **left side** usually handles grammar, sentence structure, and vocabulary.
- The **right side** helps with tone, emotion, and context.

When this brain setup happens early it helps language learning become faster and smoother. But if one side is damaged the brain can sometimes adapt (this is called **plasticity**).

Q. Explain the concept of plasticity in the brain related to language learning. (imp) define plasticity

Plasticity means the brain's ability to change, adapt, and form new connections. This is very important in language learning especially in children. When we learn a new language the brain builds new pathways to store and use the language. This ability is stronger when we are young but it becomes weaker with age making it harder to learn a new language as adults.

Q. What is the impact of cultural transmission on language learning? (imp)

Cultural transmission means that language is passed on through culture and social interaction. When we learn a language we don't just learn words and grammar we also learn the customs, values, and ways people use language in real life. This helps learners understand the language more deeply and use it correctly in social situations.

Q. Define pidgin and its role in sociolinguistics. (imp)

A **pidgin** is a **simple language** that forms when people from different language backgrounds need to communicate usually for **trade or work**. It has limited vocabulary and grammar. In sociolinguistics, pidgins show how new languages can form. When children grow up speaking a pidgin, it can become a creole, a full language with complex grammar.

Compiled By Ameer

Q. What are the two types of social structures, and how do they affect second language acquisition? (imp types of social structure)

1. **Sociolinguistic setting**: This means how important the second language is in society. If the language is valued or widely used learners are more motivated to learn it.

2. **Situational factors**: This refers to where and how the language is learned like in a **classroom** or in real social situations. Real-life use often helps learners learn faster and more naturally.

Q. Differentiate between integrative and instrumental motivation in language learning. (imp)

- **Integrative motivation**: When someone learns a language because they want to connect with the people and culture of that language.

- **Instrumental motivation**: When someone learns a language for practical reasons, like getting a job, passing exams, or studying abroad.

Q. What are three factors related to self-esteem and their effects on learning? (imp)

1. **Attribution**: This is about how learners explain their success or failure. If they believe effort helps them succeed, they stay motivated.
2. **Self-efficacy**: This means believing in your ability to do a language task .Higher self-efficacy means better learning.
3. **Willingness to communicate**: If a learner feels confident to speak, they practice more, which improves their language skills.

Compiled by Ameer

Q. What are isolated children, and how do they contribute to language acquisition research? (imp isolated children)

Definition:
Isolated children are those who grow up with little or no exposure to language due to extreme social neglect or isolation.

Explanation:
These cases help researchers understand how important early language exposure is. If a child

doesn’t hear or use language during the early years, it becomes very difficult for them to learn language later. This supports the idea of a critical period for language learning.

Q. What are the objections to the theory that "speech is essential for thought"? (imp)

Definition:
The theory claims that **speech** is necessary for thinking, but many researchers disagree with this idea.

Explanation:
Critics say that thinking can happen without speaking. For example, deaf children who don’t use spoken language are still able to think, reason, and solve problems. This shows that language helps express thoughts, but it is not always required for thinking itself.

Q. How does multilingualism affect cognitive and linguistic abilities?

Definition:
Multilingualism is the ability to use and understand more than one language and it has a positive impact on both thinking and language learning.

Explanation:
People who know multiple languages often have better memory, attention, and problem-solving skills.. Linguistically they understand how languages work and can learn new words and grammar more easily.

Q. What is linguistic creativity, and how is it studied?

Definition:
Linguistic creativity is the ability to form new and meaningful sentences while following the rules of grammar.

Explanation:
It shows how people can use language in flexible ways like telling a joke, writing poetry, or making new phrases. Researchers study it by asking people to do tasks like making up stories, changing sentence structures, or playing with words, and then checking if the results are creative and grammatically correct.

Q. What is attribution theory?(imp)

Definition:
Attribution theory focus on how people understand and explain the causes of their own success or failure in learning tasks.

Explanation:
According to Weiner people give four main reasons for their success and failure in achieving a personal goals:

Compiled by Ameer

1. **Ability** – “I’m smart” (Internal)
2. **Effort** – “I tried hard” (Internal)
3. **Task difficulty** – “The test was hard” (External)
4. **Luck** – “I was lucky” (External)

These beliefs affect motivation. If a student thinks success comes from effort, they will keep trying. But if they believe it’s just luck, they might give up.

Q. What is Piaget’s cognitive theory? (imp)

Definition:
Piaget’s cognitive development theory states that children learn and develop thinking through biological growth and interaction with their environment.

Explanation:
Piaget believed that intelligence is not fixed and that children go through different stages of thinking as they grow. Language comes after these stages as a result of thinking development. Children learn by exploring the world and adjusting their understanding when they find something new or confusing.

There Are Three Basic Components To Piaget's Cognitive Theory:

Schemas:

Adaptation processes

Stages of Cognitive Development:

Piaget Sensorimotor / Explain Sensorimotor Schema (imp)

Definition:
The sensorimotor stage is the first stage in Piaget’s theory of cognitive development, which lasts from birth to 2 years. During this stage, a child learns through senses and actions.

Explanation:
Children at this stage explore the world by sucking, grabbing, banging, or throwing things these are called sensorimotor schemata. One of the most important developments in this stage is object permanence, which means the child understands that things still exist even when they can’t see or hear them. This ability shows the beginning of mental representation and is closely linked to the start of language development because children can now think about things even if they're not present.

Q. What is Universal Grammar? (imp)

Compiled by Aneel

Definition:
Universal Grammar (UG) is the idea that all humans are born with a basic set of grammar rules shared by all languages. This idea was developed by **Noam Chomsky**.

Explanation:
Chomsky believed that children are naturally prepared to learn language. UG includes the rules and patterns that are common to all languages and children use it to understand the specific language they hear. This explains why children learn languages so quickly even without formal teaching.

Q. Explain an Innatist Theory by Noam Chomsky (imp)

Definition:
The Innatist Theory also called Nativist Theory says that humans are born with a natural ability to learn language.

Explanation:
Chomsky introduced the idea of a Language Acquisition Device (LAD) a built-in part of the brain that helps children automatically pick up language. This theory was a response to behaviorism which said language is learned through practice and repetition. Chomsky argued that language is too complex to learn just by imitation and must come from an inborn ability.

Q. Sapir-Whorf Hypothesis (imp) already explained

Definition:
The Sapir-Whorf Hypothesis, also known as linguistic relativity suggests that the language we speak shapes the way we think and see the world.

Explanation:s
According to Sapir and Whorf language influences thought. For example, if your language has many words for snow, you might notice and think about snow differently than someone whose language has only one word for it. The theory is controversial because some people believe that thought can exist without language but it still highlights how language and thinking are closely connected.

Compiled by Ameer

Q. What is meant by Language Mode? (imp)

Definition:
Language mode is the level of activation of a bilingual or multilingual person's languages at a given time.

Explanation:
A person who speaks more than one language can be in different modes:

- In a **monolingual mode**, only one language is active
- In a **bilingual mode**, more than one language is active, and the speaker may mix or switch languages.

The mode depends on the situation the people they are talking to and their intention. The idea comes from Grosjean who explained how multilingual manage their languages in different contexts.

Q. Can a Deaf Person Think Without Language?

Yes, deaf people can think without spoken language. They use visual languages like sign language or even non-verbal mental processes such as images or feelings. Studies show that deaf children play, solve problems and behave intelligently, just like hearing children.
This proves that language helps us express thoughts but it is not the only tool for thinking. Thinking can happen without spoken words.

Q. What is Taxonomic Bias? (imp)

Definition:
Taxonomic bias is a learning tendency where children assume a new word refers to similar objects not related objects.

Explanation:
For example, if a child learns that the word "dog" refers to a **collie**, they will think it also applies to a **poodle** (another dog) but not to a bone (which is related to a dog but not the same kind of object). This helps children learn categories more quickly.

Q. What is Whole Object Bias?

Definition:
Whole object bias is the assumption that a new word refers to the whole object not just a part of it.

Explanation:
When a child sees a truck and hears the word "truck," they will think the word means the entire truck not just the wheels or the color. This bias helps children learn words faster by narrowing down what a word likely refers to.

Q. Who are Auditory and Musical Learners?

Definition:
Auditory learners learn best by hearing. They understand information better through listening to speech, music or sounds.

Compiled by Ameer

Explanation:
These learners:

- Enjoy listening to explanations and stories
- May talk to themselves or sing to help remember things
- Have a good sense of tone, rhythm, and music

They often enjoy group work and may get distracted by noise. In class, using songs or spoken instructions helps them learn better.

Q. Define SLD (Specific Learning Disability) (imp)

Definition:
A Specific Learning Disability (SLD) is a condition that affects a person's ability to understand or use language whether spoken or written.

Explanation:
It can make it hard for someone to:

- Listen
- Think
- Speak
- Read
- Write
- Spell
- Do math

SLD doesn't mean the person is not smart. It just means they learn in a different way and may need special support.

Compiled by Ameer

Q. Do younger learners learn a second language faster than adults? If you agree, explain.

Answer: Yes, I agree younger learners generally learn a second language faster than adults. This is because children learn language naturally. Their brains process new languages more easily while adults use the thinking part of their brain more which slows them down. Children also have simpler communication needs and smaller vocabularies, which makes it easier for them to become fluent more quickly. In addition, children can easily copy sounds and accents while adults find it harder to adapt to new pronunciation.

Q. Why do children have better pronunciation than adults?

Children are better at pronunciation because their brains are more flexible and open to hearing and copying new sounds. At a young age, they can easily copy the sounds they hear around them which helps them speak with little or no accent. Adults, on the other hand, struggle to pronounce

words like native speakers because their brains are less adaptable to new sound patterns as they get older.

Q. Why children learn quickly and accurately (Important):

It is often believed that children learn second languages faster and more accurately than adults. This is because they learn in a natural way and their brains are highly active in recognizing sounds and patterns. Children use language in simple situations, which helps them learn more quickly. Although adults are capable of learning a language well the way they learn is more structured and thoughtful. The main difference is not who is better at learning, but how children and adults learn differently. With the right approach both can be successful language learners.

Q. Do children learn or acquire their first language?

Children acquire their first language which means they pick it up naturally without being taught. From a very young age they start to understand and use language just by hearing people talk around them. Many experts believe that young children are better at learning languages than adults. Some children can even acquire two or more languages at the same time without much difficulty.

However, some parents and teachers worry that if a child hears two languages, it might slow down their language development**.** But research shows that this is not a big problem. Children usually figure out the difference between the languages as they grow and being bilingual can actually help their brain develop better. In short, children do not learn their first language through lessons like in school they naturally acquire it through daily life and communication**.**

Compiled by Amber

Q. Define Aphasia (imp)

Aphasia is a condition where a person has trouble with speaking, understanding, reading, or writing language. It happens when the brain gets damaged, usually due to a stroke, especially in older people. Aphasia does not affect intelligence, but it makes it hard to communicate.

Q. What is Broca’s Aphasia? (Imp)

Broca’s Aphasia, also called expressive aphasia is a type of aphasia where a person has difficulty speaking clearly. They can still understand others but their own speech is broken and slow. People with Broca’s aphasia often say only the important words, like nouns and verbs, but leave out small grammar words such as "is," "the," or "and." This kind of speech is called telegraphic speech because it sounds like a telegram.

Q. Symptoms of Broca’s Aphasia: (imp)

People with Broca’s aphasia may:

- Speak in short and incomplete sentences
- Struggle with grammar

- Leave out small words (for example, saying “Cup, me” instead of “I want the cup”)
- Use more nouns than verbs
- Speak slowly and with great effort even though they know what they want to say

Q. What is Expressive Aphasia?

Expressive aphasia is another name for **Broca’s aphasia**. In this condition the person knows what they want to say but cannot say it properly. Their sentences are often made up of only main words like "dog," "run," or "school," and they leave out grammar words making their speech sound broken. For example, they may say “Smart… university… smart… good…” instead of a full sentence.

Q. What is a Syntactic Disorder? (imp)

A syntactic disorder means the person has difficulty using grammar and sentence structure correctly. This is common in language problems like **Broca’s aphasia**, where the person has trouble in using correct grammar. This kind of problem is often seen after a stroke that affects the left side of the brain especially the frontal lobe.

Q. Conduction Aphasia (imp)

Definition:
Conduction aphasia is a type of language disorder where a person can understand and speak fluently but has difficulty repeating words or phrases. It is caused by damage to the connection between Broca’s area and Wernicke’s area in the brain.

Q. Corpus Callosum (imp)

Definition:
The corpus callosum is a thick band of nerve fibers that connects the left and right hemispheres of the brain and allows them to communicate with each other.

Q. Which category deals with language disorders?

Definition:
Neurolinguistics is the branch of linguistics that studies how language functions in the brain especially when there is brain damage.

Explanation:
Neurolinguistics looks at how brain injuries (like strokes) affect language skills, such as speaking, understanding, reading, or writing. It explains disorders like aphasia, and helps us understand which parts of the brain control different language functions.

Q. Split Brain: (imp)

Compiled by Ameer

Definition:
Split brain is a condition where the connection between the two hemispheres of the brain (the corpus callosum) is cut or damaged preventing communication between the two sides.

Explanation:
Normally, the left and right hemispheres of the brain work together. But in some medical cases doctors cut the corpus callosum to stop seizures. After this surgery, each half of the brain works alone. This can cause unusual behaviors like the left hand doing something the person didn't intend because one side of the brain doesn't know what the other is doing.

Q. Difference between Surface Dyslexia and Phonological Dyslexia

Phonological Dyslexia:
A type of dyslexia where a person has difficulty sounding out unfamiliar words. They have trouble matching sounds with letters.

Surface Dyslexia:
A type of dyslexia where a person can sound out words but cannot recognize whole words by sight especially those that are irregularly spelled.

Q. Instrumental Motivation:

Definition:
Instrumental motivation refers to learning a language for practical goals such as getting a job, passing exams, or reading academic texts.

Explanation:
This type of motivation is goal-driven. The learner is interested in the benefits of knowing the language, like career advancement, translation, or travel.

Q. What is meant by motivation in SLA (Second Language Acquisition)?

Definition:
Motivation in SLA is an internal feeling that gives learners the energy, direction, and persistence to keep learning a second language.

Explanation
Motivation helps learners stay focused and works hard to learn a new language. It gives them a goal and pushes them to keep going even when learning is difficult. Without motivation, students may lose interest and find it hard to succeed in language learning.

Q. What are Metacognitive Strategies? (imp)

Definition:
Metacognitive strategies are techniques learners use to plan, monitor, and evaluate their own

Compiled by Ameer

learning. When students use metacognitive strategies, they think about how they are learning. They organize study time, notice mistakes, and try to fix them

Q. What is Cognition / Cognitive Process?

Definition:
Cognition is the mental process of gaining knowledge and understanding through thinking, experience, and learning. Cognitive processes include things like paying attention, remembering words, understanding meanings, and using language to talk or write. Our brain uses old knowledge to learn new things. Some of these processes happen automatically, like speaking fluently, while others need thinking and effort like writing a new sentence correctly.

What is Second Culture Acquisition and Social Distance?

Definition:
Second Culture Acquisition refers to the process of learning and adjusting to a new culture while learning a new language.
Social distance refers to how close or far a learner feels from the people and culture of the second language.

When someone learns a new language they also start to learn about the culture of the people who speak it. This includes their feelings, habits, ways of thinking, and behavior.
There are **4 stages** of culture learning:

1. Excitement Stage:
2. Culture Shock Stage:
3. Recovery Stage:
4. Adaptation:

Compiled by Ameer

Q. Differentiate between Language Acquisition and Language Learning (imp)

Language Acquisition is a natural process. It happens when a person (especially a child) learns a language without formal teaching just by hearing and using it in daily life.

Language Learning is a conscious process. It involves formal instruction, grammar rules, and practice, like what happens in a classroom.

Q. Write Two Factors That Affect Second Language Learning:

1. **Psychological Factors:** These include things like memory, intelligence, motor skills, and especially motivation and attitude. If a learner is motivated and has a positive attitude, they learn better.

2. **Social Factors:** These involve the learning environment such as whether the learner is in a classroom or a native-speaking country. Interaction with others also affects how well the language is learned.

Q. What is a Language Learning Strategy?

A language learning strategy is a method or technique that helps learners understand, remember, and use a new language better.

There are **two types** of strategy instruction:

- **Uninformed Instruction:** Students use strategies without knowing their names or purposes.
- **Direct and Integrated Instruction**: Students are taught about the strategies, why they are useful, and how to use them while learning the language.

Q. What is the Widely Used Instrument for Identifying SLA Strategies?

The most widely used tool is called:

Oxford's Strategy Inventory for Language Learning (SILL**)**

Q. What are Perceptual Learning Styles? (imp)

Definition:
Perceptual learning styles are the ways in which people prefer to learn through their senses.

Types (in easy words):

1. Auditory Learners – Learn best by listening.
2. Visual Learners – Learn best by seeing things like charts, pictures, or videos.
3. Tactile Learners – Learn through touch and hands-on activities.
4. Kinesthetic Learners – Learn through movement and physical activities.
5. Haptic Learners – Learn through a mix of touch and body movement (tactile + kinesthetic).

Q. Environmental learning style

It refers to how a learner's surroundings affect their ability to learn. This style can be divided into two main types. Physical learners focus on environmental factors such as temperature, lighting, sound, food, time, and classroom setting. On the other hand, sociological learners are influenced by social settings. They learn better when working in groups, pairs, or teams, and their motivation is often affected by the role and authority of the teacher.

Q. Linguistic determinism (imp)

Compiled by Ameer

Linguistic determinism is the idea that language and its structures limit and determine human knowledge as well as thought processes such as categorization, memory, and perception.

Or:

Linguistic determinism is the idea that the language we speak controls or limits how we think. This means that our thoughts, memories, and how we understand the world are shaped or even restricted by our language.

Q. linguistic relatively (imp)

Linguistic relativity is a softer version of linguistic determinism. It says that language influences how we think but it doesn't completely control it. This part of the Sapir-Whorf hypothesis suggests that speakers of different languages may perceive or interpret the world differently because of the structures and vocabulary of their languages.

Q. applied linguistic (imp)

Applied linguistics is a field that studies real-world problems related to language and tries to find practical solutions. This includes language teaching, learning difficulties, translation, and communication in media, speech therapy, and more. It combines knowledge from different areas like psychology, education, and communication to solve issues where language is a central factor.

Q. Explain SBI: (imp)

Strategy-Based Instruction (SBI) is a teaching method where students are taught **how to learn** a language more effectively. Instead of just teaching grammar and vocabulary, teachers also help students use specific strategies to remember, understand, and use the language. The idea is to make students more **independent** in their learning. Helping students understand learning strategies can improve motivation and success in learning a second language.

Q. Lexical decision task

A lexical decision task is a test where a person must quickly decide whether a group of letters is a real word or not**.** Research showed that people respond faster when the words are related and **of the same type**, like two concrete words (e.g., *apple–table*) rather than one concrete and one abstract word (e.g., *apple–freedom*). This suggests that our brain organizes concrete and abstract words differently**.**

Q. why chine's cannot express counterfactual reasoning:

Early studies suggested that Chinese speakers had difficulty with counterfactual thinking because of grammar differences in Chinese. However, later research showed that this was due to poor translations in the tests. When proper translations were used, Chinese speakers showed the same ability to think hypothetically as English speakers. So, the original claim was not supported.

Compiled by Ameer

Q. comment on natural situation in SLA

A natural situation in second language acquisition refers to learning a new language in a setting similar to how we learn our first language through real-life interactions. This can happen in places like the home, playground, workplace, or social gatherings, where the language is used naturally in conversation.

Compared to classroom learning, natural situations offer more authentic and meaningful communication**,** which helps in better understanding and remembering the language.

However, both natural situations and classroom settings have their own advantages and disadvantages. While natural situations improve fluency and comprehension, the classroom helps in structured learning of grammar and vocabulary. When combined, especially when learners are part of a language-speaking community, natural situations support and enhance classroom learning.

Q. How many languages spoken in a world currently

Over 6500 languages are spoken in the world.

Q. Does a single word or sentence gave a meaning to convey. Do u agree with this statement?

A word or sentence can convey meaning depending on the context and structure.

Q. Three levels of self-esteem (imp) define self- esteem

Self-esteem means how much you like, respect, and feel good about yourself. If you have high self-esteem**,** you believe you are valuable and capable. If you have low self-esteem, you may doubt yourself and feel less confident.

- **Inflated Self-Esteem**:

This is when a person sees themselves as better than others. They often look down on people and may disrespect or criticize them easily. It is not healthy because it prevents them from building good relationships and makes them overconfident.

- **High Self-Esteem**:

This is the most balanced and positive form of self-esteem. People with high self-esteem feel good about themselves, accept who they are, and trust their abilities. It helps them stay confident, face problems bravely and live a satisfied life. They are usually happy, motivated, and open to learning and growth.

- **Low Self-Esteem**:

This is when someone feels bad about themselves, lacks confidence, and often avoids challenges. They may not trust their own opinions or abilities and feel scared of failure.

Compiled by Ameer

Q. anxiety of SLA (imp)

Anxiety in second language acquisition refers to the nervousness, fear, or worry that learners may feel while trying to learn a new language. Research shows that this anxiety can negatively affect how well a person learns a second language. It can lower their confidence, make them hesitant to speak, and reduce their ability to remember or use new words and grammar. Both foreign language learners and those learning English as a second language often experience this anxiety, which can slow down their progress and make learning more stressful. Reducing anxiety through a supportive and encouraging learning environment can help students perform better and learn more effectively.

Q. Define Operating Principle (imp)

Definition:
Operating principles are general strategies that children use to process and learn language. According to researcher Dan Slobin, children naturally follow certain mental shortcuts or rules when learning language. These principles help explain how children across different languages learn grammar in similar patterns.

Q. Term Hemispherectomy (imp)

Definition:
A hemispherectomy is a surgical procedure where one hemisphere of the brain is removed. This operation is usually done to treat life-threatening conditions like severe epilepsy or brain tumors. Studies of patients who undergo this surgery have shown that removing the left hemisphere causes serious language problems, while removing the right hemisphere often does not. This supports the idea that language is mostly controlled by the left side of the brain.

Q. Contribution of Right Hemisphere (imp)

Definition:
The right hemisphere contributes to understanding the pragmatic aspects of language. While the left hemisphere handles grammar and vocabulary the right hemisphere helps understand tone, jokes, sarcasm, and indirect meaning. For example, if someone says something that is literally false but meant as a joke, a person with right hemisphere damage may not catch the joke. So, both sides of the brain work together during communication.

Q. Lateralization is not limited to humans or even to primates. Agree or Disagree?

Agree! Many animals show lateralization of brain functions. For example, certain birds use the **left side** of their brain for song production. Some birds even go through a “babbling” stage, similar to human babies learning to speak. This shows that lateralization is a general biological feature not just a human trait.

Compiled by Amber

Q. Which type of information is stored in left hemisphere?

• Analytic thought • Logical • Language • Reasoning • Science and Math • Written • Number skills • Right-hand control

Q. Define Codability (imp)

Definition:
Theory proposed by Brown refers to how easily a concept can be described using a word or phrase in a language. Some languages have a single word for certain objects or ideas while others do not. If a word exists the concept is easily codable. If not, people need to describe it using longer phrases. For example, English has the word **"snow"**, but if a language doesn't, speakers might say **"cold white stuff that falls from the sky."** So, codability affects how quickly and clearly we can express thoughts.

Q. Define Learning Strategies (imp)

Definition:
Learning strategies are techniques or methods that learners use to understand, learn, and remember new information. They include actions like taking notes, summarizing, repeating, asking questions, and organizing material. These strategies help students learn more effectively and become more independent learners. Teachers should introduce and encourage different strategies so that students can discover what works best for them.

Q. Define Learning Styles in Language

Definition:
Learning styles are the preferred ways individuals take in, process, and understand information when learning a language. They are influenced by a person's emotions, personality, and mental habits. Learning styles include visual, auditory, kinesthetic, etc. These styles help explain why different students learn differently even in the same classroom.

Q. Define Cultural Transmission (imp)

Definition:
Cultural transmission is the process through which cultural values, traditions, language and knowledge are passed from one generation to the next. Children learn language and behavior by interacting with family, school, and society. For example, they learn how to greet elders, what foods are common, or how to speak their native language. This process helps maintain a culture and is key in language learning especially in social settings.

Explain Pidgin (imp) already explained

Definition:
A pidgin is a simple mixed language that develops when people who speak different native

Compiled by Ameer

languages need to communicate often for trade or work. Pidgins have limited vocabulary and simplified grammar and usually borrow words from different languages

Q. Language Process

Definition:
Language processing is the mental activity involved in understanding and producing language. It includes how humans hear, understand, speak, read, and write language. It also involves using grammar, vocabulary, and meaning to form and interpret sentences. Language processing allows people to express thoughts and emotions and understand others. It involves both the brain and language systems working together.

Q. Parameters in Linguistics (imp)

Definition:
Parameters are part of Chomsky's Universal Grammar theory. They are language-specific rules that are switched "on" or "off" depending on the language being learned.

or

Parameters is a framework within generative linguistics in which the syntax of a natural language is described in accordance with general principles and specific parameters that for particular languages are either turned on or off. According to Chomsky children are born with the knowledge of the parameters and their possible settings.

Compiled by Ameer

Q. Evolution of Language

Definition:
Language evolution refers to the gradual development of language abilities in humans over thousands of years. Scientists believe that human language did not appear suddenly. It evolved through either:

- **Continuity theories**, which say language developed gradually from animal communication.
- **Discontinuity theories**, which say language, appeared suddenly due to a mutation in the human brain.

Some, like **Chomsky**, believe humans are born with a special language faculty. Others think language is a learned cultural skill. Overall, language evolution connects closely to brain development and social interaction in early humans.

Q. Bloom and Pinker proposition regarding animal communication. (Imp)

Pinker and Bloom argued that human language is qualitatively different from animal communication and likely evolved through natural selection. They believed language developed as a biological adaptation because it gave humans survival advantages. Unlike animals humans use language for complex and abstract communication.

Q. concept of language Bioprogram . (imp)

Language Bioprogram Hypothesis (by Bickerton) suggests that children have an innate grammar system that activates when proper language input is missing. This explains how Creole languages emerge with full grammatical structure despite limited input showing humans have an internal "backup" system for language.

Compiled by Ameer

Q. Extroversion

Extroversion refers to a personality trait where individuals are outgoing, social, and expressive. In second language learning extroverts may speak more and participate actively but this doesn't mean introverts are less capable; they may learn better through listening and reflection.

Q. Is Broca's aphasia and expressive aphasia same or not?

Yes, Broca's aphasia and expressive aphasia are the same condition. Both terms describe a type of aphasia where a person has difficulty producing speech but usually has good comprehension. It results from damage to Broca's area in the left hemisphere of the brain often due to a stroke.

Q. Wernicke's Aphasia (imp)

Wernicke's aphasia also called receptive aphasia occurs due to damage in Wernicke's area**,** located in the left temporal lobe near the auditory cortex**.** Individuals with this condition can produce fluent but nonsensical speech and have difficulty understanding spoken or written language**.** Key symptoms include impaired comprehension**,** poor word retrieval**,** fluent but jumbled speech (jargon)**,** and often lack of awareness of their language deficits.

Q. What is meant by order of acquisition in language acquisition process?

Order of acquisition refers to the natural sequence in which language learners acquire grammatical structures of a language. Regardless of the language children tend to learn certain features in a fixed order**.** This process happens automatically and unconsciously**.** In second language acquisition the order may vary due to interference from the first language or cognitive differences**.**

Q. Language determines shape or perception of nature explain

This concept suggests that language influences how we perceive and categorize the world around us. For example:

1. **Vocabulary reflects interest and need**: Children's fascination with dinosaurs leads them to learn and create terms related to them.
2. **Color and snow vocabulary**: While some languages have fewer color or snow terms, people can still distinguish them; however, detailed vocabulary (like the Inuits' snow terms) shows how language can shape attention to detail.
3. **Lack of word and lack of concept**: Even without a single word, like for "back of the hand", we still understand and express the idea with a phrase.
4. **Knowledge can override literal meanings**: Even if language expresses something a certain way, our beliefs and understanding might differ—language does not entirely control thought.

Compiled by Ameer

Q. What is self-esteem in SLL (Second Language Learning)? (imp define self esteem)

Self-esteem in SLL refers to how learners evaluate themselves and their belief in their ability to succeed in language tasks. High self-esteem is linked to better performance especially in speaking. It also affects risk-taking and anxiety levels. Teachers can boost learners' self-esteem through self-monitoring activities and confidence-building tasks.

Q. Process of lexical development in bilingual children

In bilingual children lexical development starts with translation from L1 to L2. Initially they access new L2 words by linking them to L1 meanings. Over time they begin to think and use L2 directly from concepts just like in their first language. This shift marks true bilingual proficiency.

Q. Explain Mental Lexicon (imp)

The mental lexicon is like a mental dictionary that stores information about word meanings, pronunciation, grammar, and usage. It helps speakers use words in real time. It is dynamic and grows with experience. Different theories explain how words are organized and accessed in the brain.

Q. Mirror Neurons (IMP)

Mirror neurons are brain cells that activate when we perform an action or see someone else perform the same action. Though not directly proven in humans brain imaging suggests similar systems exist. They are believed to help in understanding others' actions rather than imitating them directly.

Q. Autonomous (Forster's Model) (imp)

Forster's model views the mental lexicon as autonomous meaning it operates independently from meaning and grammar .Word recognition happens first and then meaning is assigned not the other way around.

Q. Object Term

Research shows that children form object categories while learning language. For example,

Korean-speaking children may learn object terms differently from English-speaking children showing that language influences how we mentally group objects.

Q. Dyslexia (imp)

Dyslexia is a learning disorder that makes reading, spelling, and decoding difficult. It happens due to differences in how the brain processes written language. Symptoms include delayed speech, poor spelling, and reading struggles.

Q. Deep Dyslexia (imp)

Deep dyslexia is **a** reading disorder where a person makes meaning-based mistakes while reading aloud. For example, they might read the word “dog” as “cat” **or** “car” as “bus.” These mistakes are called semantic errors because the person says a word that has a similar meaning but is not the same word.

Q. Language Disorder

Language disorder is when a person has difficulty understanding or using language. It can affect speaking, writing and comprehension. Common in children it may be associated with reading problems like dyslexia and leads to communication challenges.

Q. Factors of Communication Strategies

Key communication strategy factors include identifying your audience, crafting clear messages, using relevant information, recognizing communication opportunities, and collaborating with others. These help ensure effective purposeful communication across various contexts.

Q. What are Stereotypes? (imp)

Stereotypes are oversimplified ideas about a group of people. They happen when we think all people from one culture, gender, or race act the same. For example, saying "all Germans are serious" or "all Japanese are quiet" is a stereotype. These ideas are often not true for everyone in that group.

Q. Relation of Language and Thought

Some researchers believe that speech helps us think. When we learn to talk we also start to develop our thoughts. First we speak out loud then we begin to think silently in our heads. So thought is like silent speech.

Q. Difference between Language Acquisition and Language Learning (imp)

- **Language acquisition** is when a child learns to speak their first language naturally without formal teaching.
- **Language learning** is a conscious process, usually in school, where you learn grammar, vocabulary, and rules of a second language.

Q. Five Phonics Instruction Methods

Compiled by Ameer

1. **Analogy Phonics** – Using known word parts to read new words
2. **Analytic Phonics** – Looking at whole words and then breaking them into sounds.
3. **Embedded Phonics** – Teaching phonics while reading stories.
4. **Phonics Through Spelling** – Learning phonics by spelling words by sound.
5. **Synthetic Phonics** – Learning individual sounds and blending them to make words.

Q. Difference between Broca's and Wernicke's Aphasia (imp)

- **Broca's aphasia**: The person speaks with difficulty, uses short phrases, and leaves out small words. But they can understand others well.
- **Wernicke's aphasia**: The person talks fluently but their speech doesn't make sense. They also have a hard time understanding what others say.

Q. What is the difference between Piaget's and Vygotsky's cognitive development theories? (imp)

Piaget believed cognitive development happens individually through interaction with the environment in stages.

Vygotsky emphasized the role of social interaction and culture in shaping a child's thinking and development.

Q. What is the difference between continuity and discontinuity theories in language evolution?

Continuity theories suggest language evolved slowly from primate communication.
Discontinuity theories believe language appeared suddenly due to a unique genetic change or mutation.

Q. Why do we need a linguistic policy in our country?

A linguistic policy helps protect local languages, promote multilingual education, and support national unity. It ensures equal access to education and communication for all linguistic groups in the country.

Q. Birdsong and Language Learning

Birdsong studies show that some birds learn to sing like humans learn language through stages and imitation.
Birds also show left-hemisphere dominance in song learning similar to human brain lateralization in language.

Q. Define social cognition hypothesis. (Imp)

The social cognition hypothesis says language evolved to help humans connect in large social groups. It highlights that understanding others' thoughts led to using language for cooperation and bonding.

Compiled by Ameer

Q. Explain the three A's in learning strategies. (Imp)
Awareness: Knowing your learning preferences.
Adaptation: Adjusting strategies as needed.
Application: Using those strategies in real learning situations.

Q. Describe the process of first language acquisition. (imp)

1. **Babbling Stage (0–12 months):** Babies make random sounds.
2. **One-Word Stage (12–18 months):** Use single words for meaning.
3. **Two-Word Stage (18–24 months):** Combine words to form ideas.
4. **Telegraphic Speech (2+ years):** Speak in short sentences like "want juice".

End……

Wish you guy's all the very best for your final term…..

Compiled by Ameer
