Marine Coatings

H. Bleile, S.D. Rodgers, in
Encyclopedia of Materials: Science and Technology
, 2001

(a) Vinyl antifouling coatings

Vinyl antifouling coatings have been the principal antifouling coatings used since the late 1940s. These coatings consist of a binder of vinyl and wood rosin. Cuprous oxide is the antifouling agent that prevents the settlement and growth of fouling organisms. These coatings have the same general properties as other vinyl coatings. The strong red color of the cuprous oxide limits the color availability to red and black/brown (when tinted with black iron oxide). The red color is used for the underwater hull and the black color is often used for the waterline (boottop) area. These coatings are normally applied at 50–75 μm
