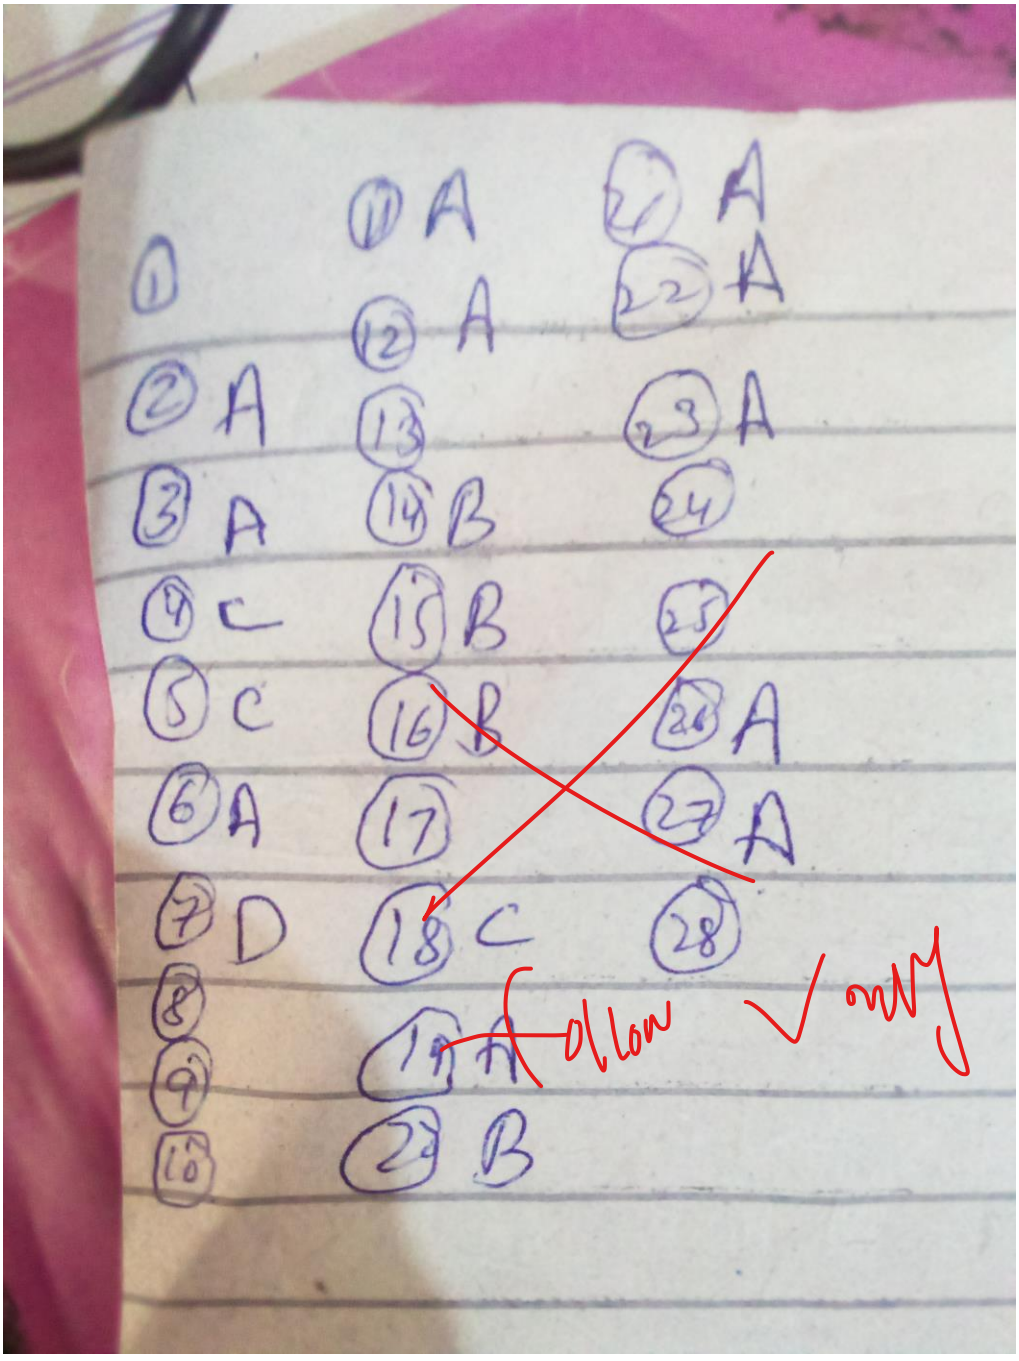
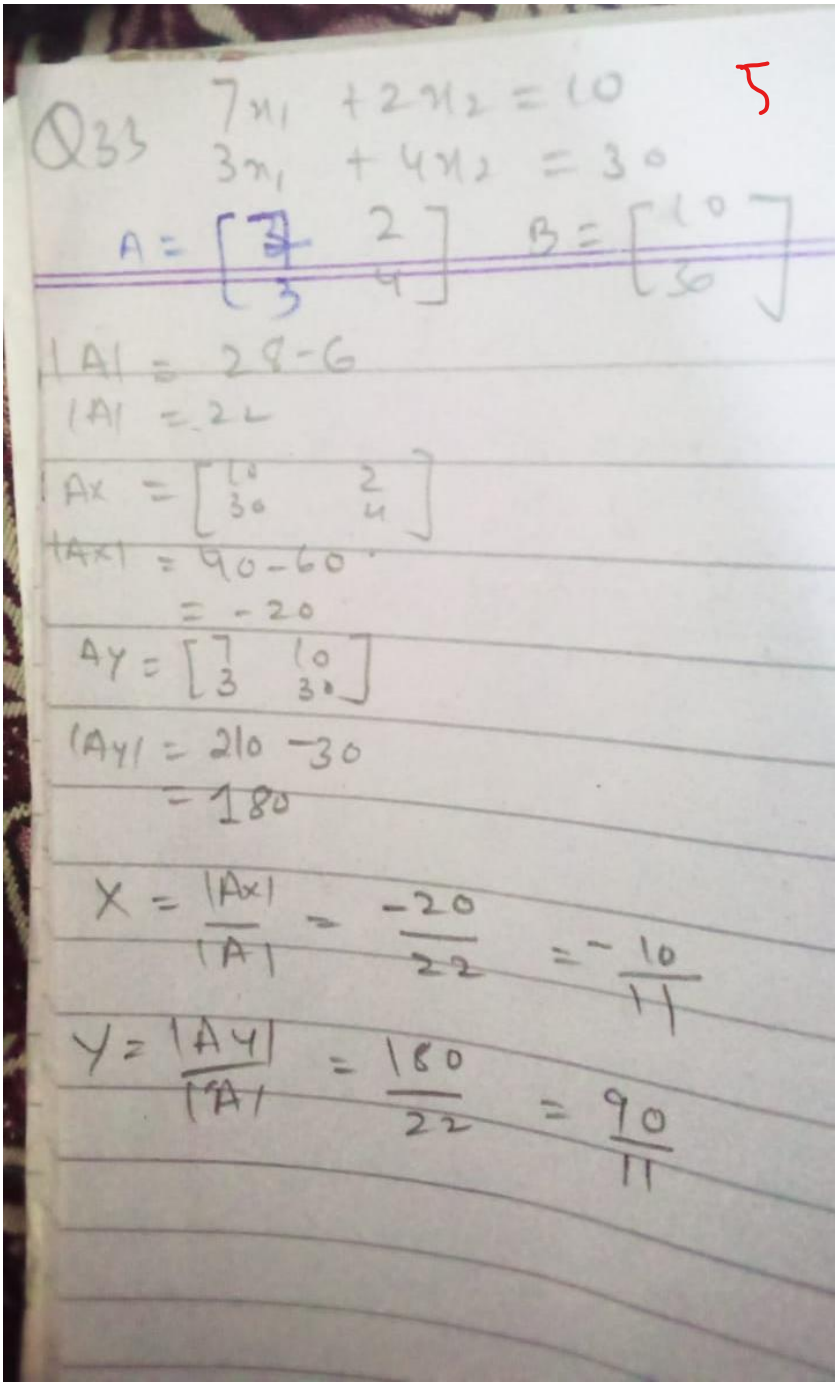
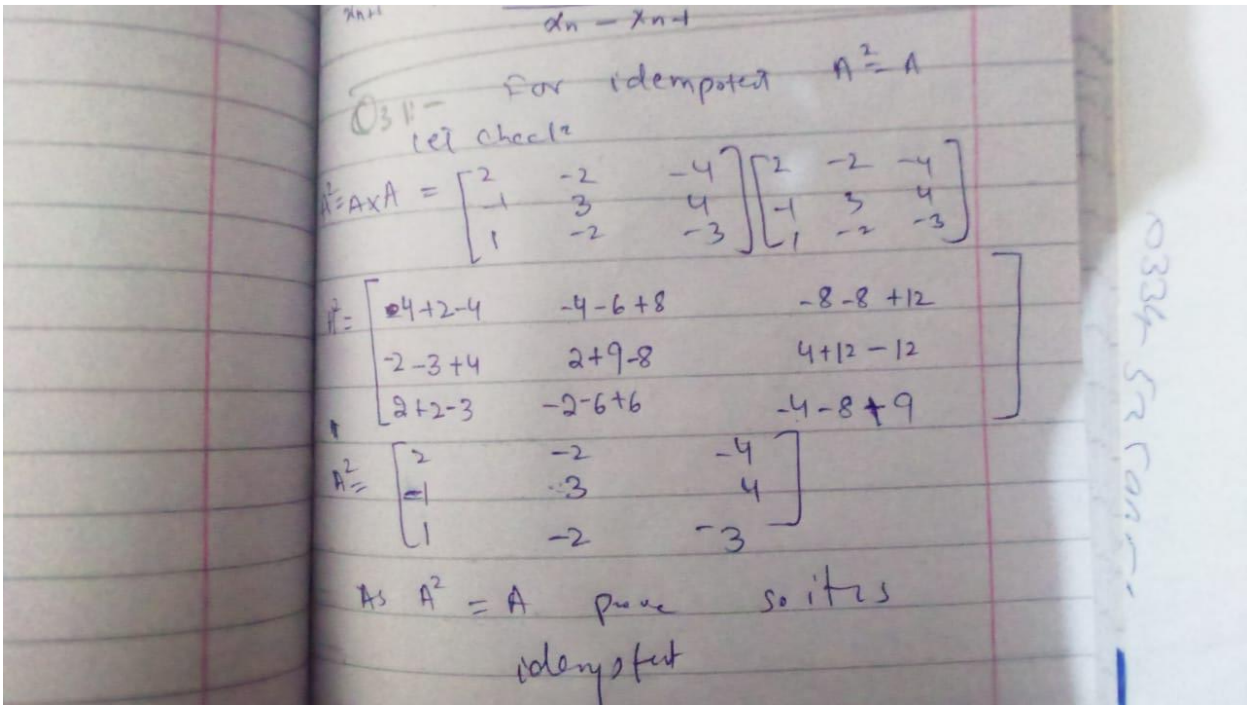
Answer





Q33 7x1 + 2x2 = 10
3x1 + 4x2 = 30
5
A = [7 2; 3 4] B = [10; 30]
|A| = 28-6
|A| = 22
Ax = [10 2; 30 4]
|Ax| = 90-60
= -20
Ay = [7 10; 3 30]
|Ay| = 210 -30
= 180
X = |Ax| / |A| = -20/22 = -10/11
Y = |Ay| / |A| = 180/22 = 90/11



Q28

To determine if line
L 1and L 2
intersect or not, we can examine their slopes. The slope of a line passing through two points (x 1,y 1)and (x 2,y 2) is given by:

(−2.5,0) and (0,5):

Slope of L 1
= 0−(−2.5)/5−0
=2

For L 2
with points (−0.5,0) and (0,1):

Slope of L 2

$= 0-(-0.5)/1-0$
$=2$

Both lines have the same slope, which means they are parallel. If two lines are parallel and distinct, they will never intersect. Therefore, in this case, L 1 and L 2
do not intersect.

Q29
standard basis vectors:

$v=-2i+3j$

Now, we can use linearity properties to find L(v). Since L is a linear transformation, we have:

$L(v)=L(-2i+3j)=-2L(i)+3L(j)$

Substitute the given values:

$L(v)=-2(1,2)+3(3,-2)$

Perform the scalar multiplication and addition:

$L(v)=(-2,-4)+(9,-6)$

Combine the corresponding components:

$L(v)=(7,-10)$

Therefore, $L(-2,3)=(7,-10)$, which means that the image of the vector $(-2,3)$ under the linear transformation L is $(7,-10)$.
