

PSY405 - Lesson 36

Skinner's Theory of Personality

1. Radical Behaviorism – Skinner's Core Idea

- **Definition:** Radical Behaviorism is Skinner's school of thought which says that **all behavior is learned** and can be explained **without talking about internal feelings or thoughts**.
- **Key idea:** Don't explain behavior by saying "I felt anxious, so I didn't go" – that's too vague. Instead, look at **what consequences followed past behavior** that made it more or less likely.
- **Example:**
 - You avoid a party because you "feel anxious."
 - Skinner would say: It's not the feeling that stopped you; it's **your past experiences with avoidance or discomfort**, the "aversive consequences," that shaped this behavior.
 - You run into a burning building to save someone.
 - It's not "heroism" – it's that similar behaviors in the past were reinforced (you might have been praised or rewarded for helping others), making you more likely to act this way.

Plain English: Skinner says behavior is like a math formula: past rewards and punishments shape what you do next. Feelings are **effects**, not causes.

2. Behaviorism Basics

- **Behaviorism:** A psychology approach focused on **observable behavior** – what people do, not what they think or feel.
- **Behavior:** Anything you can **see or measure** (overt behavior).
- **Key mechanism: Stimulus → Response (S-R)**
 - A **stimulus** is something that triggers a reaction.

- A **response** is how you act in reaction.
- **Types of conditioning:**
 - **Classical (respondent) conditioning:** Associating one stimulus with another (Pavlov).
 - **Operant (instrumental) conditioning:** Learning from consequences (Skinner).

Example:

- Classical: Bell → Dog salivates (Pavlov).
 - Operant: Ice cream after cleaning your room → you clean more often.
-

3. Biographical Sketch

- Born **1904**, Pennsylvania, son of a lawyer. Curious kid: built **gadgets, toys, rafts, slingshots, steam cannons** – basically a mini inventor.
- **Education:** Started in English (wanted to be a writer), then shifted to **Psychology at Harvard**.
- Worked with **E.G. Boring, Carroll Pratt, Henry Murray** – big names in early psychology.
- **Major contributions:**
 - **Skinner Box** – a controlled environment to study animal behavior.
 - **Teaching machines** – early tech to shape learning.
- **Books:**
 1. *Walden-II* – experimental society.
 2. *The Behavior of Organisms* – classic behavior study.
 3. *Science and Human Behavior* – applied behaviorism.
 4. *Verbal Behavior* – language learning through behavior.
 5. *Beyond Freedom and Dignity* – controversial ideas about control and society.
- **Death:** 1990, just after receiving lifetime contribution award.

4. Classical Conditioning

- **Originators:** Pavlov & Watson.
- **Definition:** Learning occurs when a neutral stimulus (bell) gets paired with something meaningful (food) to produce a response (salivation).

Key Terms:

- **Unconditioned Stimulus (UCS):** Something that naturally causes a response (food).
- **Unconditioned Response (UCR):** Natural response to UCS (salivation).
- **Conditioned Stimulus (CS):** Neutral thing that gets associated with UCS (bell).
- **Conditioned Response (CR):** Learned response to CS (salivating at bell).

Steps (Example with Pavlov's Dogs):

1. Meat powder (UCS) → Salivation (UCR) – natural.
 2. Bell (CS) + Meat (UCS) → Salivation (UCR).
 3. Bell alone (CS) → Salivation (CR).
- **Second-order conditioning:** You can chain learning.
 - Pair a **green light** with the bell → eventually, the dog salivates to green light too.
 - **Extinction:** If the bell keeps ringing without food → salivation decreases.

Plain English: The dog "learns" that the bell predicts food. Remove food → behavior fades. Humans learn tons of S-R associations without realizing (likes/dislikes, fears, preferences).

5. Operant Conditioning

- **Origin:** Thorndike (Law of Effect), then Skinner.
- **Definition:** Learning happens based on the **consequences of voluntary actions**.

Key Terms:

- **Operant:** A behavior that **acts on the environment** (painting, crossing street).
- **Reinforcement:** Increases likelihood of behavior.
 - **Positive:** Adds something good (ice cream after cleaning).
 - **Negative:** Removes something bad (stop nagging when you do homework).
- **Punishment:** Decreases likelihood of behavior.
 - **Positive:** Adds something unpleasant (shock).
 - **Negative:** Removes something good (no TV).

Thorndike's Law of Effect:

- Rewarded behavior → repeated.
- Punished behavior → avoided.

Shaping / Successive Approximations:

- Teach complex behaviors step by step using reinforcement.

Example:

- Want to train a dog to roll over. First reward **sitting**, then **lying down**, then **rolling over**. Step by step.

Plain English: Operant conditioning is like life's reward system. Do something good → you get reinforced. Do something bad → punished → you stop. Works for kids, pets, employees.

6. Applications

- Education: Teaching machines, reinforcement systems.
 - Therapy: Behavior modification techniques.
 - Parenting: Rewarding good behavior, discouraging bad behavior.
 - Society: Laws, rewards, and punishments guide behavior.
-

7. Summary / Key Takeaways

- **Behaviorism:** Focus on what we can see, not what we feel.
- **Classical conditioning:** Passive, associating stimuli.
- **Operant conditioning:** Active, learning from consequences.
- **Reinforcement and punishment:** Shape behavior in predictable ways.
- **Skinner:** Made psychology experimental, precise, measurable, and practical.

Quick Examples for Memory Hooks

Term	Meaning	Example
UCS	Naturally triggers response	Food → salivation
UCR	Natural response	Salivate to food
CS	Neutral stimulus paired with UCS	Bell
CR	Learned response	Salivate to bell
Operant	Voluntary action affecting environment	Clean room, paint picture
Reinforcement	Increases behavior	Ice cream reward
Punishment	Decreases behavior	No TV for misbehavior
Shaping	Step-by-step reinforcement	Train dog to roll over

Q1: What is Radical Behaviorism according to Skinner?

Answer:

Radical Behaviorism is Skinner's approach in psychology that focuses entirely on observable behavior. It rejects explanations based on inner feelings, thoughts, or emotions, and instead emphasizes that behavior is shaped by its consequences (rewards or punishments). In other words, people act the way they do because of the learning history and outcomes of their past behaviors, not because of what they "feel" inside.

Explanation:

Skinner argued that talking about feelings like anxiety or fear doesn't explain why people act in certain ways. For example, saying "I avoided the party because I felt anxious" is not enough. Skinner would look at the past experiences and consequences that led to that avoidance. Radical Behaviorism focuses on **what**

can be measured and **how behavior changes over time due to reinforcements or punishments.**

Example:

If a child gets praise for sharing toys, they are more likely to share again. It's not because they "feel generous," but because the praise is a reinforcement that increases sharing behavior.

Tips:

- Think of behavior as a **mathematical function**: past rewards/punishments → current behavior.
 - Ignore "inner feelings" when analyzing behavior; focus on **observable actions** and **their consequences**.
-

Q2: What is the main difference between classical conditioning and operant conditioning?

Answer:

Classical conditioning is learning through association between two stimuli, usually **passive**, while operant conditioning is learning through the consequences of voluntary behavior, usually **active**.

Explanation:

- **Classical conditioning (Pavlov)**: A neutral stimulus becomes associated with a naturally occurring stimulus to produce a response. The learner doesn't actively do anything to get reinforced; the association happens automatically.
- **Operant conditioning (Skinner)**: The learner performs actions voluntarily, and these actions are strengthened or weakened based on the consequences (reinforcement or punishment).

Example:

- Classical: A dog salivates (response) when it hears a bell (conditioned stimulus) because it predicts food (unconditioned stimulus).
- Operant: A student studies hard (behavior) and receives good grades (positive reinforcement), increasing the likelihood of studying in the future.

Tips:

- **Classical = passive + association.**
 - **Operant = active + consequences.**
 - Think Pavlov = reflexes; Skinner = voluntary actions.
-

Q3: What are the core concepts of classical conditioning?

Answer:

The core concepts are:

1. **Unconditioned Stimulus (UCS):** Naturally triggers a response (e.g., food).
2. **Unconditioned Response (UCR):** Natural reaction to UCS (e.g., salivation).
3. **Conditioned Stimulus (CS):** Previously neutral stimulus that, after pairing with UCS, triggers a response (e.g., bell).
4. **Conditioned Response (CR):** Learned response to CS (e.g., salivation to bell).
5. **Extinction:** Gradual disappearance of CR when CS is repeatedly presented without UCS.
6. **Second-order conditioning:** Using an already conditioned stimulus to condition a new stimulus.

Explanation:

Classical conditioning is all about **learning by association**. The UCS naturally causes a response. By pairing a neutral stimulus (like a bell) with the UCS repeatedly, the neutral stimulus becomes conditioned to produce the same response. Extinction happens when the connection is broken, and second-order conditioning allows chaining multiple learned associations.

Example:

- Step 1: Food (UCS) → Salivation (UCR)
- Step 2: Bell (CS) + Food (UCS) → Salivation (UCR)
- Step 3: Bell alone (CS) → Salivation (CR)

- Step 4: Pair bell (CS) with green light → green light eventually produces salivation (second-order).

Tips:

- Visualize it as a chain: **UCS → UCR → CS → CR.**
 - Remember: Classical conditioning is about **what predicts what.**
-

Q4: What is operant conditioning and how does it work?

Answer:

Operant conditioning is a type of learning where behavior is influenced by its consequences. Voluntary actions (called **operants**) are either reinforced to increase their frequency or punished to decrease it. Reinforcement strengthens behavior, while punishment weakens behavior.

Explanation:

Skinner observed that people and animals act on their environment and that the **results of those actions** determine whether they will repeat them. Reinforcement can be **positive** (adding something good) or **negative** (removing something unpleasant). Punishment can also be positive or negative, depending on whether something bad is added or something good is removed.

Example:

- Positive reinforcement: A child does homework → gets candy → more homework done in future.
- Negative reinforcement: A car beeps until you buckle seatbelt → you buckle → beeping stops → you buckle next time.
- Positive punishment: Touch hot stove → get burned → less likely to touch again.
- Negative punishment: Teen breaks curfew → loses phone privileges → less likely to break curfew.

Tips:

- Reinforcement = repeat behavior. Punishment = stop behavior.
- Think "operant" = **action that affects environment.**

Q5: What is the Law of Effect?

Answer:

The Law of Effect, proposed by Thorndike, states that behaviors followed by satisfying consequences are likely to be repeated, while behaviors followed by unsatisfying consequences are less likely to be repeated.

Explanation:

This principle is the foundation of operant conditioning. It highlights the **connection between actions and their consequences**. Animals and humans naturally learn from feedback: if it feels good, they repeat it; if it feels bad, they avoid it.

Example:

- A cat in a puzzle box learns to pull a lever to get food → lever-pulling behavior increases (satisfying).
- If the lever caused discomfort instead → behavior decreases (unsatisfying).

Tips:

- Think: **"Reward → repeat, punishment → stop."**
- This is the backbone of all behavior modification techniques.

Q6: How do reinforcement and punishment differ?

Answer:

- **Reinforcement:** Any consequence that **increases the likelihood** of a behavior. Can be **positive** (adding something good) or **negative** (removing something bad).
- **Punishment:** Any consequence that **decreases the likelihood** of a behavior. Can also be positive (adding something unpleasant) or negative (removing something pleasant).

Explanation:

Reinforcement strengthens actions; punishment weakens them. Positive and negative refer to **adding or removing a stimulus**, not "good" or "bad."

Example:

- Positive reinforcement: Extra allowance for finishing chores.
- Negative reinforcement: Stop nagging when homework is done.
- Positive punishment: Extra chores for misbehavior.
- Negative punishment: No TV for bad grades.

Tips:

- Focus on **behavior outcome**, not morality.
 - Positive = add, Negative = remove; reinforcement = increase, punishment = decrease.
-

Q7: What are the main applications of Skinner's theory?**Answer:**

Skinner's theory is applied in **education, therapy, parenting, workplace, and social systems**. It is used to:

- Shape learning through reinforcement.
- Modify undesirable behaviors.
- Increase productivity and compliance through rewards and punishments.
- Develop teaching machines and programmed instruction.

Explanation:

Skinner's work shows that behavior is predictable and manageable with proper consequences. Teachers, parents, and employers use these principles all the time, often unconsciously, to guide behavior.

Example:

- Schools: Reward systems for good grades.
- Therapy: Token economies for children with behavioral issues.
- Workplace: Bonuses for meeting targets.

Tips:

- Think “behavior design”: You can **engineer behavior** systematically.
 - Reinforcements are most effective when **immediate and consistent**.
-

Q1: Explain Skinner’s Radical Behaviorism and its main principles.

Answer:

Radical Behaviorism is the psychological theory developed by B.F. Skinner, which focuses entirely on **observable behavior** and the **environmental factors** that shape it. It rejects explanations based on internal states like thoughts, emotions, or feelings. Behavior is viewed as **learned** through interaction with the environment, primarily via **reinforcements and punishments**.

Main Principles:

1. **Observable Behavior is Central:** Only behavior that can be measured should be studied.
2. **Behavior is Learned:** All actions are shaped by past experiences and consequences.
3. **Environment Shapes Behavior:** Behavior is controlled by external stimuli and responses, not internal feelings.
4. **Consequences Determine Frequency:**
 - Positive reinforcement → increases behavior
 - Negative reinforcement → increases behavior by removing something unpleasant
 - Punishment → decreases behavior

Example:

- A child cries in a store to get candy. If the parent gives candy (positive reinforcement), the crying behavior increases.

Principle	Meaning	Example
Observable Behavior	Study what can be measured	Tracking how many times a child raises hand in class
Learned Behavior	Shaped by experiences	Learning to ride a bike after repeated practice
Environmental Control	Stimuli and consequences guide behavior	A cat presses a lever for food
Consequences	Reinforcements/punishments shape future actions	Rewards increase behavior, punishment decreases behavior

Explanation (Plain English):

Skinner says: don't blame feelings for why people do things. Your behaviors are like **predictions based on past outcomes**. If a behavior has been rewarded, you do it again; if punished, you avoid it. For example, you go to work not because you "love responsibility," but because past work earned you money (reinforcement) or avoiding negative outcomes (like getting fired).

Tip: Always ask, "**What consequence shaped this behavior?**" when analyzing actions.

Q2: Describe Skinner's Biography and contributions to Psychology.

Answer:

Biographical Overview:

- **Born:** 1904, small-town Pennsylvania, USA
- **Early Life:** Inventive child, built toys, rafts, and mini machines
- **Education:**
 - Studied English at Hamilton College, initially wanted to be a writer
 - Shifted to **Psychology at Harvard**, influenced by E.G. Boring, Carroll Pratt, and Henry Murray
- **PhD:** Received in 1931, then worked as a postdoc at Harvard

- **Academic Career:**

- University of Minnesota (1936–1945)
- Significant contributions to experimental psychology

Major Contributions:

1. **Skinner Box:** Controlled environment to study animal learning
2. **Teaching Machines:** Early technology for educational reinforcement
3. **Books:**
 - *Walden-II* (1948) – novel about experimental society
 - *The Behavior of Organisms* (1938) – foundation of operant conditioning
 - *Science and Human Behavior* (1953) – applied behavioral analysis
 - *Verbal Behavior* (1957) – language as learned behavior
 - *Beyond Freedom and Dignity* (1971) – controversial on control and society

Honors:

- Distinguished Scientific Award (APA)
- Membership in National Academy of Sciences
- President's Medal of Science

Explanation (Plain English):

Skinner wasn't just a psychologist—he was an **inventor of experimental tools** to study behavior. He used technology and controlled experiments to **prove learning principles scientifically**. Even his novels explored psychological ideas, showing his interest in applying science to society.

Tip: Remember Skinner = **experimenter + inventor + theorist**. Think of him as the "engineer of behavior."

Q3: Explain Classical Conditioning and its process.

Answer:

Definition:

Classical conditioning is a type of learning in which a neutral stimulus becomes associated with a meaningful stimulus, eventually producing a conditioned response.

Key Terms:

- **Unconditioned Stimulus (UCS):** Naturally triggers a response (e.g., food)
- **Unconditioned Response (UCR):** Automatic reaction to UCS (e.g., salivation)
- **Conditioned Stimulus (CS):** Neutral stimulus that becomes associated with UCS (e.g., bell)
- **Conditioned Response (CR):** Learned response to CS (e.g., salivation to bell)
- **Extinction:** Gradual weakening of CR when CS is presented without UCS
- **Second-order conditioning:** Using an already conditioned stimulus to condition a new stimulus

Process Example (Pavlov's Dogs):

1. Food (UCS) → Salivation (UCR)
2. Bell (CS) + Food (UCS) → Salivation (UCR)
3. Bell alone (CS) → Salivation (CR)
4. Pair bell with green light → green light eventually causes salivation (second-order)

Applications:

- **Phobias:** Fear of dogs can be conditioned through negative experiences
- **Advertising:** Pairing product (CS) with positive imagery → positive emotional response

Explanation (Plain English):

Classical conditioning is **learning by association**. If a neutral thing consistently predicts something important, your brain learns to respond. It's passive learning—you don't choose to learn; your body reacts automatically.

Tips:

- Think UCS → UCR first, then add CS → CR.
 - Extinction occurs when the association stops being meaningful.
 - Use second-order conditioning to see how **learning can chain together**.
-

Q4: Explain Operant Conditioning, including reinforcement and punishment.

Answer:

Definition:

Operant conditioning is learning in which the **consequences of voluntary behavior** influence its likelihood of recurring.

Key Concepts:

1. **Operant:** Voluntary behavior that acts on the environment
2. **Reinforcement:** Consequence that increases behavior
 - Positive Reinforcement: Adding something pleasant
 - Negative Reinforcement: Removing something unpleasant
3. **Punishment:** Consequence that decreases behavior
 - Positive Punishment: Adding something unpleasant
 - Negative Punishment: Removing something pleasant

Law of Effect (Thorndike):

- Satisfying outcomes → behavior repeated
- Unsatisfying outcomes → behavior avoided

Examples:

Type	Example	Effect
Positive Reinforcement	Candy for homework	Increases homework behavior

Type	Example	Effect
Negative Reinforcement	Stop beeping when seatbelt buckled	Increases seatbelt use
Positive Punishment	Extra chores for misbehavior	Decreases misbehavior
Negative Punishment	No TV for bad grades	Decreases rule-breaking

Shaping / Successive Approximations:

- Teach complex behaviors step-by-step by reinforcing small improvements
- Example: Train a dog to roll → first reward sitting, then lying, then rolling

Explanation (Plain English):

Operant conditioning is **active learning**: you do something, and the environment reacts. If the reaction is good, you repeat it; if it's bad, you stop. This is why parents, teachers, and managers reward or punish behavior.

Tip:

- Always ask: **What happens after this behavior?** That will tell you if it's being reinforced or punished.
- Reinforcement = frequency goes up, Punishment = frequency goes down.

Q5: Compare and contrast Classical and Operant Conditioning.

Answer:

Feature	Classical Conditioning	Operant Conditioning
Learning Type	Passive	Active
Behavior	Reflexive (automatic)	Voluntary
Focus	Association of stimuli	Consequences of behavior
Key Figures	Pavlov, Watson	Skinner, Thorndike
Example	Bell → Salivation	Study → Good grades

Explanation:

- Classical is about **associating one thing with another** (predictive).
- Operant is about **learning through consequences** (results).
- Classical = automatic responses; Operant = voluntary actions.

Example:

- Classical: A child cries when hearing the dentist drill because it predicts pain.
 - Operant: A child studies to get rewards or avoid punishment.
-

Q6: Discuss applications of Skinner's Theory in real life.

Answer:

1. Education:

- Reward systems, teaching machines, stepwise learning

2. Parenting:

- Reinforce good behavior, use mild punishment to discourage bad habits

3. Workplace:

- Bonuses, recognition, promotions to increase productivity

4. Therapy:

- Token economies, behavior modification for children or adults

5. Society:

- Laws, regulations, and social norms act as reinforcement or punishment

Example:

- A school gives stickers for completing homework → students complete homework more regularly.
 - A company gives yearly bonuses for meeting sales targets → employees work harder.
-

Explanation (Plain English):

Skinner's theory is everywhere: **your world is full of reinforcements and punishments**, whether you notice it or not. He gave us tools to **predict and shape behavior systematically**.

Tip:

- To apply Skinner: Identify the behavior → choose reinforcement/punishment → observe changes.
- Consistency and immediacy make reinforcement most effective.

Cheat Sheet

1. Key Terms & Definitions

Term	Definition (Plain English)	Example	Memory Hook / Mnemonic
Radical Behaviorism	Focuses on observable behavior , not feelings; behavior shaped by consequences	Child studies → gets candy → studies more	"Behavior is radical if you can see it "
Stimulus (S)	Anything that triggers a response	Bell, light, fire alarm	S = "Signal"
Response (R)	Reaction to a stimulus	Salivation, running away	R = "Reaction"
Unconditioned Stimulus (UCS)	Naturally causes a response	Food → dog salivates	UCS = "Unlearned trigger"
Unconditioned Response (UCR)	Automatic reaction to UCS	Dog salivates to food	UCR = "Unlearned response"
Conditioned Stimulus (CS)	Neutral stimulus paired with UCS to trigger a response	Bell → dog salivates	CS = "Created stimulus"
Conditioned Response (CR)	Learned response to CS	Salivation to bell	CR = "Conditioned reaction"

Term	Definition (Plain English)	Example	Memory Hook / Mnemonic
Extinction	When a learned response fades if reinforcement stops	Bell rings, no food → dog stops salivating	Extinction = "Exit the response"
Second-Order Conditioning	Pairing a new stimulus with a conditioned one	Bell + green light → dog salivates at green light	"Chain learning"
Operant	Voluntary behavior that affects the environment	Studying, pressing a lever	Operant = "Opens environment"
Reinforcement	Consequence that increases behavior	Candy for homework	Reinforce = Repeat behavior
Punishment	Consequence that decreases behavior	Extra chores for misbehavior	Punish = Prevent behavior
Positive Reinforcement	Adds something good to increase behavior	Praise, candy	"+ something nice"
Negative Reinforcement	Removes something bad to increase behavior	Stop nagging when homework done	"– something annoying"
Positive Punishment	Adds something unpleasant to decrease behavior	Extra chores	"+ something bad"
Negative Punishment	Removes something pleasant to decrease behavior	No TV for breaking rules	"– something nice"
Shaping / Successive Approximations	Teaching complex behavior step-by-step	Dog roll → reward sitting → lying → roll	"Stepwise training"
Law of Effect	Behaviors with satisfying outcomes repeat; unsatisfying ones stop	Cat in puzzle box	"Reward → Repeat; Punish → Stop"

2. Classical vs Operant Conditioning

Feature	Classical Conditioning	Operant Conditioning
Learning Type	Passive	Active

Feature	Classical Conditioning	Operant Conditioning
Behavior	Reflexive / Automatic	Voluntary
Key Concept	S → R (Stimulus-Response)	Behavior → Consequence
Key Figures	Pavlov, Watson	Skinner, Thorndike
Example	Bell → Dog salivates	Study → Good grades
Key Terms	UCS, UCR, CS, CR	Reinforcement, Punishment, Operant

Memory Tip:

- **Classical** = Pavlov's reflexes
- **Operant** = Skinner's actions & consequences

3. Types of Reinforcement & Punishment

Type	Adds / Removes	Effect on Behavior	Example
Positive Reinforcement	Adds something good	Increases	Candy for homework
Negative Reinforcement	Removes something bad	Increases	Stop nagging when chores done
Positive Punishment	Adds something bad	Decreases	Extra chores for misbehavior
Negative Punishment	Removes something good	Decreases	No TV for breaking rules

Tip: Think +/- = add/remove, and reinforce = increase, punish = decrease.

4. Steps in Classical Conditioning (Pavlov's Dog)

Step	Description	Example
1	UCS → UCR	Food → Salivation
2	CS + UCS → UCR	Bell + Food → Salivation
3	CS alone → CR	Bell → Salivation
4	Second-order	Bell + Green Light → Salivation at Green Light

Step	Description	Example
5	Extinction	Bell → No Food → Salivation fades

Memory Hook: "UCS first, then CS, then CR" → think "Unlearned becomes Learned."

5. Applications

- **Education:** Teaching machines, reinforcement systems
- **Parenting:** Reward good behavior, discourage bad behavior
- **Therapy:** Token economies, behavior modification
- **Workplace:** Bonuses, promotions, praise
- **Society:** Laws, rules, social norms shape behavior

Tip: Whenever you want to **change behavior**, ask: *What reinforcement or punishment can I use?*

6. Quick Mnemonics / Memory Tricks

1. Classical vs Operant:

- **Classical** = **C**onditioned reflex (passive)
- **Operant** = **O**ptions (voluntary action)

2. Positive / Negative Reinforcement / Punishment:

- **"+ = add, - = remove"**
- **"Reinforcement = Repeat, Punishment = Prevent"**

3. UCS → UCR → CS → CR:

- **"Unconditional causes reaction → Conditioned causes response"**

4. Shaping: "Step by step, reward each move."
