Solved By Hina Shahzadi

1. -----Set is a container which wholly includes or wholly exclude any given element.

Classical BSCS.

Fuzzy

Universal logical

2. Hypothesis space is used to avoid ----- search over the entire concept space.mcq

Exhaustively BSCS.

Conflict

Selected

Linear

3. ID stands for

Interactive display

Interactive dichotomizer BSCS.

Information display

Information dichotomizer

4. Deductive learning works on-----facts and knowledge.

Solved By Hina Shahzadi

Fuzzy
Boolean
Existing BSCS.
New

5. In unsupervised search a an
----- represent some specific
underlying patterns in the data.

cluster BSCS.

6. Which of the following is correct
command in CLIPS to see the list is
facts?

CLIPS >show facts
View facts
List facts

CLIPS>(Facts) BSCS.

7. The first step of FIND -S is to
initialize h to the hypothesis in ---

H BSCS.

8. While designing an expert system
getting knowledge from the expert is
called -----

knowledge elicitation BSCS.

Solved By Hina

Shahzadi

9. Which modifies the performance element so that it makes better decision?

Changing element

Learning element BSCS.

performance element

Observing element

10. Which of the following is the component of learning system.

WWW

Error

Goal

Speech recognition BSCS.

11. The multilayer perceptrons are the most basic artificial neural

NetWork BSCS.

12. Soft computing is naturally applied in ----- learning applications.

machine BSCS.

Solved By Hina

Shahzadi

13. In backward chaining terminology the term hypothesis to prove is referred -----

Goal BSCS.

14. In CLIPS ----- command is used to delete a fact.mcq

Modify

Retract BSCS.

Assert

Single

15. Fuzzy sets unlike ----- sets do not restrict themselves to something lying wholly in either set A or in set not A or in

classical BSCS.

16. ----- logic lets us define more realistically the true functions that define real world scenario.

fuzzy BSCS.

17. Usually a -----graph is chosen to represent a fuzzy set.

Triangular BSCS.

Solved By Hina

Shahzadi

Circular
Conical
Square

18. Outputs of learning are determined by the ----- **Application** BSCS.

19. The tractable problems are further divided into structured and ----- problem.

Intractable
Complex BSCS.
Simple
Difficult

17. A single layer perceptron can perform pattern classification on problem.

False BSCS.

18. is one of the founding languages developed particularly for planning.mcq

STRIPS BSCS.

Solved By Hina Shahzadi

TRIPS

RIPST

SPIRITS

20. Naturally there is no supervision of classification in ----- algorithms for their learning or clustering.

cluster BSCS.

21. Learning can be described normally as a relatively permanent change that occurs in:

behavior BSCS.

21. The entropy is----- when the collection contains equal number of positive and negative examples (impurity).

0

1 BSCS.

0,1

1,2

Solved By Hina

Shahzadi

22. A drawback of FIND -S is that it assumes the consistency within the ----- data.

Training BSCS.

23. An expert system may ----- the expert or assist the expert.mcq

Cure

Ignore

Overload

Replace BSCS.

24. Forward chaining on the other ----- is like an exhaustive search

hand BSCS.

Question:

1. Name the three components of action predicates used in planning systems

Solution:

It has three components namely, the predicate itself, the pre-condition, and post-condition predicates.

Solved By Hina

Shahzadi

2. Illustrate the role of a knowledge engineer?

Solution:

A knowledge engineer is 'a person who designs, builds and tests an Expert System' (Durkin). A knowledge engineer plays a key role in identifying, acquiring and encoding knowledge.

3. How can you elaborate the term similarity measurement in context of ANN?

Solution:

In the context of Artificial Neural Networks (ANN), similarity measurement refers to the process of determining how similar two or more input patterns, vectors, or data points are to each other. This is crucial in various ANN applications, such as:

Solved By Hina

Shahzadi

1. Pattern recognition: Measuring similarity helps the network identify patterns and classify new inputs accordingly.
2. Clustering: Similarity measurement groups similar data points into clusters, enabling unsupervised learning.
3. Nearest Neighbor algorithms: Similarity measurement finds the closest matches to a given input, useful in recommendation systems and image retrieval.
4. What are the knowledge acquisition techniques that are used in development of expert system?

Solution:

nowledge acquisition techniques used in the development of expert systems include:

1. Interviews: Expert interviews to gather knowledge and experiences.

Solved By Hina

Shahzadi

2. Questionnaires: Structured questionnaires to collect information from experts.

3. Observation: Observing experts' problem-solving behaviors.

4. Protocol analysis: Analyzing experts' thoughts and decisions during problem-solving.

5. Case studies: Analyzing specific cases and experts' solutions.

6. Knowledge elicitation techniques: Techniques like laddering, repertory grids, and sorting to extract knowledge.

7. Documentation analysis: Analyzing existing documents, reports, and manuals.

8. Expert workshops: Collaborative workshops with experts to gather knowledge.

9. Machine learning: Using machine learning algorithms to acquire knowledge from data.

Solved By Hina

Shahzadi

10. Knowledge engineering: A systematic approach to acquiring, modeling, and implementing knowledge.
