CURRENT FINAL PAPERS OF

SUBJECTIVE ALL QUESTIONS ARE INCLUDED

EFFORT BY HASINA ALI

LONG QUESTIONS 5 MARKS

1-Types of case studies: (5)

☐ **In single instrumental case study,**

The researcher focuses on an issue or concern, and then selects one bounded case to illustrate this issue.

☐ **In collective/multiple case study,**

The one issue or concern is again selected, but the inquirer selects multiple case studies to illustrate the issue.

☐ **In intrinsic case study,**

Focus is on the case itself because the case presents an unusual or unique situation.

2-Challenges of ground theory? (5)

A grounded theory study challenges researchers for the following reasons:

- 1-** The investigator needs to set aside, as much as possible, theoretical ideas or notions so that the analytic, substantive theory can emerge.
- 2-** The researcher faces the difficulty of determining when categories are saturated or when the theory is sufficiently detailed.
- 3-** The researcher needs to recognize that the primary outcome of this study is a theory with specific components: a central phenomenon, causal conditions, strategies, conditions and context, and consequences.

3-Difference b/w Qualitative research & Quantitative research with example (5)

Qualitative research

- ☐ To gain an in depth understanding and explanation of some particular social phenomenon.
- ☐ The data collection is done by interviewing; however, an understanding of the social phenomenon and personal lived experiences of individuals might be gained via non-intrusive qualitative approaches in which the researcher might use texts, journals, written narratives or observations.
- ☐ Qualitative research questions begin with "How?" and/or "Why?" questions, but can begin with a "What?" question as well.

Examples:

- ☐ Experiments
- ☐ Surveys
- ☐ Content Analysis
- ☐ Using Existing Statistics

Quantitative research

- ☐ Quantitative research, on the other hand, explores descriptive analysis of characteristics through variables or answers questions about the relationships among variables.
- ☐ Quantitative research studies generally end with a summation of the verification process, which is a confirmation or disconfirmation of the hypotheses tested via deductive reasoning.
- ☐ Conclusively, the aim of qualitative research is discovery, while the aim of quantitative research is verification.

Examples:

- ☐ Field Research
- ☐ Case Study
- ☐ Focus Group Discussion

4-Participant/Non-Participant Observation in Participant studies? (5)

Observation studies can be participant or non-participant.

Participant Observation:

In participant observation the researcher directly observes and participates in small scale social settings in the present time. Such a study is also referred to as **field research**, ethnography, or anthropological study

Here the researchers:

1. Study people in their natural settings, or in situ.
2. Study people by directly interacting with them.

Perspective,

Gain an understanding of the social world and make theoretical statements about members. The people could be a group who interact with each other on regular basis in a field setting: a street corner, a tea Shop, a club, a nomad group, a village, etc.

Non-participant studies

1. Non-participant studies are such where the research tries to observe the behavior of people without interacting with them.
2. It could be observing the behavior of shoppers in a departmental store through a mirror or on a closed circuit TV. Somebody might be counting the number of vehicles crossing a particular traffic light.

5-Explain Discriminant Validity (5)

Also called divergent validity, discriminant validity is the opposite of convergent validity.

It means that the indicators of one construct hang together or converge, but also diverge or are negatively associated with opposing constructs.

It says that if two constructs A and B are very different, then measures of A and B should not be associated.

For example, we have 10 items that measure political conservatism.

People answer all 10 in similar ways.

But we have also put 5 questions in the same questionnaire that measure political liberalism.

Our measure of conservatism has discriminant validity if the 10 conservatism items hang together and are negatively associated with 5 liberalism ones.

6-Enlist five qualitative research methods are discussed by John W. Creswell in his book (5)

Five qualitative research methods are discussed by John W. Creswell in his book. Following are the five qualitative research methods:

1. Narrative Research.
2. Phenomenology.
3. Grounded Theory.
4. Ethnography.
5. Case Study

7-Explain external validity? (5)

1. Even if the researcher eliminates all concerns for internal validity, external validity remains a potential problem.
2. External validity is the ability to generalize experimental findings to real life situations.
3. Without external validity, the findings are of little use for both basic and applied research
4. i.e we shall not be able to develop any theories that could be applicable to similar other situations.
5. Threats to external validity: Reactivity

8-Differentiate b/w Semi-structured and unstructured interviewing? (5)

Unstructured Interviewing:

- Unstructured interviewing applies minimum control over the informant and the responses.
- Unstructured interviewing is formal interviewing.
- There is no disguise that the occasion is just a friendly chat.
- Hence, there is always a question to answer, or a topic to discuss.
- However, the informants have the liberty to choose their own scope, depth, emphases, length and pace of the response.
- At times, the informant may even choose to deviate from the original question or topic.

Semi-structured Interviewing:

Semi-structured interviewing is interviewing with an interview guide.

Semi-structured interviewing follows all the principles of unstructured interviewing, except that the informants are not expected to move too far beyond the scoped.

9-Challenges of phenomenology? (5)

1. Phenomenology requires at least some understanding of the broader philosophical assumptions, and these should be identified by the researcher.

2. The participants in the study need to be carefully chosen to be individuals who have all experienced the phenomenon in question, so that the researcher, in the end, can forge a common understanding.
3. Bracketing personal experiences may be difficult for the researcher to implement.
4. An interpretive approach to phenomenology would signal this as impossibility for the researcher to become separated from the text.
5. Thus, the researcher needs to decide how and in what way his or her personal understandings will be introduced into the study.

10-Explain the four types of ground theory?(5)

Types of grounded theory studies:

- The two popular approaches to grounded theory are the systematic procedures of Strauss and Corbin (1990, 1998) and the constructivist approach of Charmaz (2005, 2006).
- In the more systematic, the investigator seeks to systematically develop a theory that explains process, action, or interaction on a topic.
- Charmaz's approach is known as the constructivist grounded theory method as it adheres to a constructivist philosophical approach, wherein both the researcher and participants mutually co-construct meaning during data collection and analysis.

11-Survey interview and field interview?(5)

Survey Interview

1. It has clear beginning and end.
2. The same standard questions are asked of all respondents in the same sequence.
3. The interviewer appears neutral at all times.
4. The interviewer asks questions, and the respondent answers.
5. It is almost always with one respondent alone.
6. It has a professional tone and businesslike focus, diversions are ignored.
7. Closed-ended questions are common, with rare probes.
8. The interviewer alone controls the pace and direction of interview.
9. The social context in which the interview occurs is ignored and assumed to make little difference.
10. The interviewer attempts to mold the communication pattern into a standard framework.

Field Interview

1. The beginning and end are not clear. The interview can be picked up later.
2. The questions and the order in which they are asked are tailored to specific people and situations.
3. The interviewer shows interest in responses, encourages elaboration.
4. It is like a friendly conversational exchange but with more interviewer questions.

5. It can occur in group setting or with others in area, but varies.
6. It is interspersed with jokes, aside, stories, diversions, and anecdotes, which are recorded.
7. Open-ended questions are common, and probes are frequent.
8. The interviewer and member jointly control the pace and direction of the interview.
9. The social context of the interview is noted and seen as important for interpreting the meaning of responses.
10. The interviewer adjusts to the member's norms and language usages.

12-Narrative research?

- ☐ "Narrative is understood as a spoken or written text giving an account of an event/action or series of events/actions, chronologically connected".
- ☐ The procedures for implementing this research consist of focusing on studying one or two individuals, gathering data through the collection of their stories, reporting individual experiences, and chronologically ordering (or using life course stages) the meaning of those experiences.

13-Four types of narrative research?

- ☐ 1. A biographical study is a form of narrative study in which the researcher writes and records the experiences of another person's life.
- ☐ 2. Autobiography is written and recorded by the individuals who are the subject of the study.
- ☐ 3. A life history portrays an individual's entire life, while a personal experience story is a narrative study of an individual's personal experience found in single or multiple episodes, private situations, or communal folklore.
- ☐ 4. An oral history consists of gathering personal reflections of events and their causes and effects from one individual or several individuals

14-Limitations of focus group discussion?

- ☐ The moderator may influence the participants (bias).
- ☐ FGDs have limited value in exploring complex beliefs of individuals.
- ☐ FGDs can paint a picture of what is socially acceptable in a community rather than what is actually occurring or believed. (real and ideal problems)

15-Challenges in case study?

Despite the fact that the case study may be considered empirical yet it lack rigor in its approach.

Therefore it has limitations with respect to the reliability of the findings. Also one could question whether the case is representative of some population

16-Explain validity of secondary data?

- ☐ Existing statistics and secondary data are not trouble free. Researchers must be

concerned about validity and reliability .

☐ A common error is the fallacy of misplaced concreteness. Someone gives a false impression of accuracy by quoting statistics in greater detail than warranted by how the statistics were collected.

17-What points should keep in mind while working in table?

Give each table a number.

Give each table a title.

Label the row and column variables, and give name to each of the variable categories.

Include the totals of the columns and rows. These are called as marginal.

Each number or place that corresponds to the intersection of category for each variable is cell of a table.

Missing information to be given under the table

18-Explain FGD (Focus group discussion) and its purpose?

☐ A focus group discussion is a group discussion of 6-12 persons

☐ Guided by a facilitator,

☐ Participants talk freely and spontaneously about a certain issue.

The purpose of FGD:

☐ To obtain in-depth information on concepts, perceptions, and ideas of the group.

☐ More than an question-answer interaction.

☐ Group members discuss the topic among themselves.

19-Ethnographic and its procedure?

☐ Ethnography is a qualitative design in which the researcher describes and interprets the shared and learned patterns of values, behaviors, beliefs, and language of a culture-sharing group (Harris, 1968).

☐ An ethnography focuses on an entire cultural group which may be small, but typically it is large, involving many people who interact over time

☐ 'ethnography involves extended observations of the group, most often through participant observation

Procedures for conducting an Ethnography:

☐ Determine if ethnography is the most appropriate design to use to study the research problem.

☐ Identify and locate a culture-sharing group to study

☐ Select cultural themes or issues to study about the group

☐ To study cultural concepts, determine which type of ethnography to use.

☐ Gather information where the group works and lives.

☐ Forge a working set of rules or patterns as the final product of this analysis

20-Types of ethnography?

□ There are many forms of ethnography, such as a confessional ethnography, life history, autoethnography, feminist ethnography, ethnographic novels, and the visual ethnography found in photography and video, and electronic media. Two popular forms are:

□ The realist ethnography is a traditional approach used by cultural anthropologists. It reflects

a particular stance taken by the researcher toward the individuals being studied

□ The critical ethnography involves the authors advocate for the emancipation of groups marginalized in society

21-Explain three types of control?

Three types of controls

□ Manipulation: control over stimulus/treatment.

□ Holding conditions constant i.e. control over the environment (the confounding factors).

□ Control over the composition of groups – balancing. Find out the way that individual differences do not confound the X variable under investigation.

Randomization is the answer

22-Qualitative research?

□ To gain an in depth understanding and explanation of some particular social phenomenon.

□ The data collection is done by interviewing; however, an understanding of the social

phenomenon and personal lived experiences of individuals might be gained via non-intrusive qualitative approaches in which the researcher might use texts, journals, written narratives or observations.

□ Qualitative research questions begin with "How?" and/or "Why?" questions, but can begin with a "What?" question as well

23-Phenomenological study?

□ A phenomenological study describes the meaning for several individuals of their lived experiences of a concept or a phenomenon.

□ The basic purpose of phenomenology is to reduce individual experiences with a phenomenon to a description of the universal essence.

24-Grounded theory

Grounded Theory is an inductive methodology. It is a systematic methodology in the social sciences involving the construction of theory through the analysis of data. to move beyond description and to generate or discover a theory, an abstract analytical schema of a process.

It is the systematic generation of theory from systematic research. It is a set of rigorous research procedures leading to the emergence of conceptual categories.

Thus, grounded theory is a qualitative research design in which the inquirer generates a general explanation (a theory) of a process, action, or interaction shaped by the views of a large number of participants (Strauss & Corbin, 1998).

25-What is narrative study and phenomenology?

Narrative Research

“Narrative is understood as a spoken or written text giving an account of an event/action or series of events/actions, chronologically connected”.

The procedures for implementing this research consist of focusing on studying one or two individuals, gathering data through the collection of their stories, reporting individual experiences, and chronologically ordering (or using life course stages) the meaning of those experiences.

Phenomenology

A phenomenological study describes the meaning for several individuals of their lived experiences of a concept or a phenomenon.

The basic purpose of phenomenology is to reduce individual experiences with a phenomenon to a description of the universal essence.

26-Linear positive and linear negative?

A linear relationship looks like larger percentage in diagonal cells

If percentages direction is high at first and then decreases down to table so that relation is negative its mean if one variable is decrease other is increases.

If percentages direction is low at first and then increases along with table that type of relation is called linear positive and the relation of variables is if one increases other is also increases.

27-Linear relationship?

If no relationship:

- ☐ Percentages look approximately equal across row or columns.
- ☐ A linear relationship looks like larger percentage in diagonal cells.
- ☐ **Larger percentages in the diagonal cells**

If there is curvilinear relationship, the largest percentages form a pattern across cells e.g. the largest cells might be the upper right, the bottom middle, and the upper left.

It is easier to see relationship in a moderate sized table (9 cells) where most cells have some cases (at least 5 cases)

28-A simple way to see strong relationship is to circle the largest percentage in applicable row or column and see if a line appears

Differentiate between realistic and critical ethnography?

- The realist ethnography is a traditional approach used by cultural anthropologists. It reflects a particular stance taken by the researcher toward the individuals being studied
- The critical ethnography involves the authors advocate for the emancipation of groups marginalized in society

29-Difference between scale and index?

- Indexes and scales often used interchangeably.
- Scale is a measure to capture the intensity, direction, level, or potency of a variable. Arranges responses on a continuum. A scale can use single indicator or multiple indicators. Ordinal level.
- Index is a measure in which researcher adds or combines several distinct indicators of a construct into a single score. Composite score

30-Theoretical Sampling?

Field research sampling differs from survey sampling, although sometime both use snowball sampling.

A field researcher samples by taking a smaller, selective set of observations from all possible observations.

It is called theoretical sampling because it is guided by the researcher's developing theory.

Field researchers sample times, situations, types of events, locations, types of people, or context of interest

31-Measures in research method?

- Measurement is a process of ascertaining the extent or quantity of the concept, idea, or construct
- Follow some measurement procedure.
Come up with empirical data that represent the concept.
- Use some existing yardstick, standard or develop your own

32-What is question in mind of researcher while evaluating quality of evidence pertaining historical comparative research?

Major questions:

- How did major societal change take place?
- What fundamental features are common to most societies?
- Why did current social arrangement take a certain form in some societies but not in others?

Revolution in society and not in another. Feelings about the value of children. Changes.

- H-C research strengthens conceptualization and theory building

33-Report parts?

The makeup of the report – the report parts:

- ☐ Prefatory parts.
- ☐ Main body.
- ☐ Appended parts.

34-Difference between bibliography and reference?

A bibliography is the listing of the works that are relevant to the topic of research interest arranged in alphabetical order of the last names of authors.

A reference list is a subset of the bibliography, which includes details of all the citations used in the literature survey and elsewhere in the report, arranged again, in the alphabetical order of the last names of authors.

35-Criterion-Related Validity?

- ☐ Uses some standard or criterion to indicate a construct accurately.
- ☐ Compare the measure with another accepted measure of the same construct.
- ☐ Does the measure differentiate individuals on the criterion it is expected to predict?
- ☐ Two subtypes (a) concurrent validity, (b) predictive validity

36-Validity in experiment?

- ☐ Validity refers to confidence in cause and effect relationship.
- ☐ Internal validity is high in Laboratory experiments.
- ☐ External validity (generalizability) is not sure.

37-Assumption?

Assumption is that:

- Knowledge accumulates.
- We learn from and build on what others have done.

38-Define Proposition?

- ☐ A statement concerned with the logical relationships among concepts.
- ☐ Logic (argument) abstracted from observed reality.
- ☐ Theory is the highest level of abstraction.
- ☐ Theory is a network of propositions.

39-What is Theory?

- ☐ A coherent set of general propositions used as principles of explanation of the apparent relationships of certain observed phenomena.
- ☐ Key element in this definition is proposition.

40-What is Body of report?

- ☐ Introduction:
 - Background
 - Objectives
- ☐ Methodology.

☐ Results → can be divided into different areas.

☐ Limitations.

☐ Conclusions and recommendations

☐ References.

☐ Acknowledgements.

Pretest and post-test reliability?

☐ Frequently a researcher measures the Y more than once during an experiment.

☐ Pretest is the measurement of Y prior to treatment.

☐ Posttest is the measurement of Y after the treatment introduced into the experimental situation

41-Steps in experiment?

- Begin with an hypothesis.
- Decide on an Exp design to test H.
- Decide how to introduce X.
- Develop a measure of Y.
- Set up an experiment and do pilot testing.
- Locate appropriate subjects.
- Randomly assign subjects to groups and give instructions.
- Gather data for the pretest of Y.
- Introduce the X to experimental group only and monitor all groups.
- Gather data for posttest of Y.
- Debrief the subjects by informing them of the true purpose of experiment.
- Examine data, make comparisons between groups. Test Hypothesis

42-Benefits of scientific method?

Research methods are scientific methods and very human knowledge is not science
Science is a method

A procedure to produce knowledge i.e. discovering uniformities/ principle's, laws in this universe.

Process of "sensory experiences

- Observation
- Repetition
- Reobservation.
- By repeating the observation researchers want to be definite/positive.

This approach is called positivism

Results are organized, systematized, and made part of the body of knowledge.

43-Challenges in implementing case study?

The case study researcher must decide which bounded system to study the researcher must consider whether to study a single case or multiple cases

Selecting the case requires that the researcher establish a rationale for his or her purposeful sampling strategy for selection of case and for gathering information about the case.

44-Relationship of variables?

- ☐ Relationship among variables. Logical.
- ☐ A statement concerned with the theoretical relationship among variables is a proposition.
- ☐ If the relationship refers to an observable reality, then the proposition may be testable → call it a hypothesis.

45-Electronic and non-interactive media?

Modern communication – use of digital technology – Electronic interactive media

- ☐ Use of digital technology to reach people.
- ☐ Respondents are actively involved. Internet – new electronic interactive media

Non-Interactive Media

- ☐ Traditional questionnaire received by mail
- ☐ Self administered questionnaires
- ☐ Questionnaires delivered through other means – Fax machine, uploading on internet, printing in the newspaper.
