BT301 CURRENT MCQS FOR (FINAL TERM)

1. Probe is fragment of DNA/RNA which is labelled with P32.
2. Sequences that were used beyond 400bp contain an average error. 32%.
3. Happy mapping is an technique in Vitro.
4. How many types of ribonucleotides 4.
5. The minor groove of the DNA helix. 3.4A
6. The nucleotide in DNA molecules are joined by Phosphorus diestor bond.
7. Human have genome size 3MB.
8. The loss of plasmid Segregative instability.
9. PBR322 contain resistance against Ampicillin or Tetracycline.
10. Lady claudia suffering from trachaal disease was named as Claudia 7 racbia.
11. In 1876 Kuline discovered enzyme Trypsin.
12. YACs in which larger fragment of DNA can be inserted.
13. Degradation of protein was prevented by somatostatin and B-Glactosidase.
14. Mutagensis change in genetic information of an organism.
15. PCR used for two amplify of target sequences.
16. RT-PCR is by means of Reverse transcriptase.
17. Real time pCR / a PCR use to measure DNA, cDNA, RNA.
18. Which is the type of PCR reaction fragment of DNA randomly antified RAPD.
19. Genomic can study the genome All set of gene present in an organisms.
20. DNA, profiling technique to identify individual character of their DNA.
21. PCR-molecular polentology refer to Analysis of ancient human animal and plant enemies.
22. Clone by clone a map of chromosomal gene is made before DNA is split into fragment.
23. Micro array are used to study the expression of many genes.
24. Phage display allows the expression of exogenesis on surface of many genes.
25. Phage display determine enzyme specified to generate target specific antibodies.
26. PCR-Site directed mutageneous single bases mismatched between amplification primer and template become incorporate into template sequences as a result of amplification.
27. M13 filamentous bacteriophage, single sited DNA without killing host.
28. Bacteria plasmid range of E.coli 1-200 dalta.
29. Which one is naturally occurring plasmid Col Ei, Ps101.
30. Plasmid which were not constructed in vitro soil purpose of charging.
31. DNA sequencing determine the order of nucleotide with in DNA molecule.
32. A method of DNA sequencing which make use of chemical reagent to bring about base specific cleavage of DNA Maxam method.
33. Which is not used in separation method of DNA, RNA or protein HCL.
34. In chromosomes of specific gene determine the location and distance between the genes in chromosomes is called Genome mapping.
35. Disadvantage of using Psc101 In cloning. It has low molecular weight.
36. Defination of Cosmid vector: Plasmids have been constructed which contain afragment of ʎ DNA including '*cos*' site

VU BIO ANIMALS

37. Which vectoe has long life span_____
    a)Yacs b)Bacs c)PaCS yh options thy D wala option nh yad
38. A great advantange of hybridization for library screening is that Versatile.
39. Define :Chromosomal walking: Walking along the chromosome is a term used to describe an approach which allows the isolation of gene sequences whose function is quite unknown but whose genetic location is known Chromosomal walking.
40. Define: Immunochemical screening: Immunochemical screening involves the use of antibodies that specifically recognize antigenic determinants on the polypeptides synthesized by a target clone
41. A term that use characteristics of DNA in cloning_____
42. In somatostatin,degradation was prevented by using which protein B glatosidase.
43. Mobile DNA moves with genome.
44. Screening by using clone by clone procedure definition?
45. Which distance in genome mapping are calculable in terms of units called map.
46. Which one of this is bacterion?
47. Lemda ZAP is present in_____.
48. Define ALPHA HELUX:
49. Define DNA profile:
50. Define Red biotechnology:
51. Define Autoradiography: A technique using X-ray film to visualize fragment of molecules.
52. Define Cdna: cDNA is prepared by reverse-transcribing cellular RNA
53. Define RAPD: RAPD-Random amplification of polymorphic DNA is a type of PCR reaction but the segments of DNA that are amplified are random.
54. Define Phage display: Phage display is the technology that allows expressionof exogenous polypeptides on the surface of phage particles.
