Bt406

Lecture # 1-2

Objective

By Arfa Amjad

MCQS

1. Social research can be used to raise children, reduce crime, improve public health, sell products, improve workers' efficiency, or just understand one's life.
2. Research is simply the process of finding solutions to a problem after through study and analysis of the situational factors.
3. Problems may refer to some undesirable situation or these may refer to simply a curiosity of the researcher that may be agitating his or her mind.
4. In a recent BA/BS examination of the Punjab University 67 percent of the students failed.
5. Conducting such research offers th pleasure of solving a puzzle.
6. Research provides the needed information that guides the planners to make informed decisions to successfully deal with the problems.
7. The researchers try to make use of their finding for generating theories and models that could be used for understanding human behavior.
8. The decision- making process associated with the development and implementation of a strategy involves four interrelated stages.
9. Study by a professional might help locating the magnitude of the issue as well as its solutions.
10. Financial investment may not be "paying off" as anticipated.
11. Science is a method, a procedure to produce knowledge.
12. Observation here implies that scientists use "sensory experiences" for the study of the phenomena.
13. Scientist use their five senses, which are possessed by every normal human being.

14. By repeating the observation, the researchers want to be definite and positive about their findings. Those who want to be definite and positive are often referred to as positivists..
15. Scientific method is concerned with the realities that are observable through "sensory experiences."
16. Facts and figures are to be provided with language and thereby inferences drawn.

2

Course code Bt406 Topic No 3

Classification of research

1 Research comes in many **shapes** and **sizes**

2 **Good researches u**nderstand the advantages and disadvantages

3 For classification of research we should look from **4 dimensions**

4 Purpose of research organized into **3** groups

5 The exploring of a new topic to learn about it is called **exploratory research**

6 The researchers **goal i**s to formulate more **precise** question

7 **Exploratory r**esearch the first stage in sequence of studies

8 **Initial research** conducted to clarify the nature of problem

9 **Exploratory research i**s a useful preliminary step that helps to ensure more rigorous for future study

10 Source for exploratory research are **experien e surveys ,pilot studies and secondary data analysis**

11 Economical and quick source of background information is **secondary data analysis**

12 **Pilot study** implies that some aspect of research is done on **small scale**

13 Descriptive research represents the picture of specific detail

14 **Lobour force surveys ,population census and educational census** are examples o descriptive research

15 A great deal of social research is **descr ptiv e**

16 Explanatory research looks for **causes a.. reasons**

17 Basic researchers generates new **ideas ..ciples and other theories**

18 **Applied reaserchers** can also build new knowledge

19 Basic and applied researcher applie**s scientific method** to answer question

20 Scientific community is th**e primary consume**r of basic research

21 Types of applied research are **action research ,impact assessment research and evaluation research**

22By the angle of time research could be divided into **2 types** cross sectional and longitudinal research

23 Data may be **quantitative and qualitative**

25 Quantitavtie techniques are **experiments ,surveys and context analysis**

26 Qualitative techniques are **field research ,case study and focus group discussion**

27 **Cross sectional** research observe at one point in time

28 **Longitudinal research** observe features more than one time

29**Panel study i**s the most powerful type of longitudinal research

30 **Cohort analysis is** similar to panel study

BT406 topic#4

- The purpose of **science** concerns with the **expansion of knowledge, discovery of truth** and **to make prediction**.
- **Theory** building is the means by which basic researchers hope to achieve the purpose of science.
- A systematic and general attempt to explain something is the purpose of **theory**.
- **Theory** is a coherent set of general propositions.
- **Preposition** is a statement concerned with the logical relationship among concepts.
- **Logic (argument)** abstracted from observed reality.
- **Theory** is the highest level of abstraction.
- Theory is a network of **preposition**
- **Concept** is a generalized idea about a class of objects, attributes, occurrences, or processes.
- **Research** produces **facts**.
- **Theory** as orientation provides **framework.**
- Theory as **conceptualization** and **classification** provides **concepts.**
- Theory in summarizing role is **empirical generalization**.
- Theory predicts facts is **extrapolation**.
- **Facts** initiate **theory**.
- Facts lead to the **rejection and reformulation** of theory.
- Theory and research are **interrelated**.
- Facts clarify theory and new facts **redefine** theory.

Bt406

Lecture # 5

Objective

By saima

MCQS

1. The goal of ethics in research is to ensure that no one is harmed or suffers adverse consequences from research activities.
2. Codes and regulations guide researchers and sponsors.
3. Review boards and peer groups help researchers examine their research proposals for ethical dilemmas.
4. Ethical research requires personal integrity from the researcher, the project manager, and the research sponsor.
5. Unethical activities • Violating nondisclosure agreements.• Breaking respondent confidentiality.• Misrepresenting results.• Deceiving people.• Invoicing irregularities.• Avoiding legal liability.
6. Societal norms are codes of behavior adopted by a group.
7. Research ethics require personal integrity of the researcher.
8. three parties are involved the researcher, the sponsoring client (user), and the respondent (subject).
9. Consciously or unconsciously, each party expects certain rights and feels certain obligations towards the other parties.
10. When ethics are discussed in research design, we often think first about protecting the rights of the participant, respondent, or subject.
11. The respondent has many rights to be safeguarded.
12. The researcher should follow three guidelines;1. Explain study benefits.2. Explain respondent rights and protections 3. Obtain informed consent
13. Inducements to participate, financial or otherwise, should not be disproportionate to the task or presented in a fashion that results in coercion.

BT 406 lecture 6

1. Ethics are noms or standards of behavior that guide moral choices about over behavior and our relationships with other.

2. The goal of ETHICS in research is to ensure that no one is harmed or suffers adverse consequences from research activities.

3. Unethical activities are pervasive and include violating non-disclosure agreements breaking respondent confidently misrepresenting results; deceiving people avoid legal liability and more.

4. Deception occurs when the respondent are fold only part of truth or when the truth is fully compromised.

5. Deception should not be used in an attempt to improve response rates.

6. The respondent must have given their informed consent before participating in the research.

7. Securing informed in the consent from respondent in the matter of fully disclosing the procedure of the proposed survey.

8. Debriefing usually includes a description of the hypothesis being tested and the purpose as the study.

9. All individual have right to privacy and researchers must respect that right.

10. The privacy guarantee is important not only to retain validity of the research but also protect respondent.

11. A right to privacy means one has right to refuse to answer any question in an interview.

12. Honest cooperation is main obligation of the respondent or the subject.

13. Companies have the right to dissociate sponsorship of a research project. This type of confidentially is called sponsorship non-disclosure.

14. Many corporation, professional, associations and universities have code of ethics.

15. Natural science conc[illegible] re often expressed in Symbolic form.

Advertisement

16. Social science concepts are expressed as words.

17. Height is a characteristic of physical object the distance from top to bottom.

18. Dictionary definition is also called conceptual or theoretical or normal definition.

19. Conceptual definition is a definition in abstract theoretical term. It refers to other idea or construct.

20. Conceptual definition is linked to theoretical frame worries and valve position.

21. Concepts vary in their level of abstraction.

22. Abstract concept refers to idea that has a diffuse, indirect expression.

23. The concepts stand for phenomenon not the phenomenon itself hence it may be called abstraction of empirical reality.

24. The organization of concepts in sequence from the most concrete and individual to the most general indicates the degree of abstraction.

25. Social science concept from a specialize language or jargon.

26. Specialist use Jargon as a short hand way to communication with one other.

27. Vague meaning attach to a concept create problem if measurement.

28. An operational definition gives meaning to concept by specifying the activities or operation necessary to measure it.

29. Operation definition is also called a working definition stated in term of specific testing or measurement criteria.

1) General area of study_____.

Organization

2) Problem currently existing in an organization _____.

Sexual harassment

3) It is a part of exploratory_____.

Preliminary

4) It is a productivity _____.

Decline

5) Demand for daycare _____.

Facilities

6) Derive the hypothesis from the_____.

Theoretical hypothesis

7) How many method of resarch design_____.

6

8) It has a _____analysis.

Secondary data

9) The most Common method of generating.

Primary data

10) Questionnaires an _____tool.

Essential

11) It has a _____ types of experiments.

2

12) In-depth analysis of a _____.

Unit

13) Discussion of an issues by _____to _____person assisted by a moderator.

6,12

14) Supplementary the _____information.

Qualitative

15) Variety of way_____.

Field and lab

1. Topic NO: 8

10

2. Broad area of interest include family, population, (labor union) and marketing.
3. (Narrowing topic) try to get background information from different sources
4. Publish articles are excellent sources of ideas for(research question).
5. Examine the literature challenge the(previous findings)
6. Explore unexpected findings discovers in previous research specify the (intervening)process
7. share ideas with (knowledgeable) people.
8. Focus onto specific(historical) period
9. Considers which(subgroups) are involved expected expected differences
10. From research question to hypothesis (tentative) answer to question identification of
11. (Variables).
12. (present problem) statement in clear and precise manner.
13. Problem could be an existing business problem identify by (manager).
14. Management delimmas to be translated into (research question).
15. Sponsored researches consist of (5) steps.
16. Documents that present a plan for project to reviews for(evaluation)

11. (Variables).

12.(present problem) statement in clear and precise manner.

13.Problem could be an existing business problem identify by (manager).

14.Management delimmas to be translated into (research question).

15.Sponsored researches consist of (5) steps.

16.Documents that present a plan for project to reviews for(evaluation)

17.Convince the review about(capabilities) of researcher.

18.Introduction of research proposal sections includes background, (objectives) and significance.

19.Research design consist of data collection technique,population,sample,tools,fieldwork,data processing and analysis.

LESSON 9 (Grand Quiz) **BT406** **By Ayesha Aish**

REVIEW OF LITERATURE

1. A literature review is based on the assumption that knowledge accumulates and that we learn from and build on what others have done.
2. Scientific research is a collective effort of many researchers who share their results with one another and who pursue knowledge as a community.
3. Today's studies build on those of yesterday. Researchers read studies to compare, replicate, or criticize them for weaknesses.
4. Reviews vary in scope and depth. Different kinds of reviews are stronger at fulfilling different goals of review.
5. To demonstrate a familiarity with a body of knowledge and establish credibility.
6. A good review increases a reader's confidence in the researcher's professional competence, ability, and background.
7. A review outlines the direction, ability, and background of research on a question and shows the development of knowledge.
8. A good review places a research project in a context and demonstrates its relevance by making connections to a body of knowledge.
9. To integrate and summarize what is known in an area.
10. A review pulls together and synthesizes different results.
11. A good review points out areas where prior studies agree, where they disagree, and where major questions remain.
12. It collects what is known to a point in time and indicates the direction for future research. No reinventing the wheel. No wastage of effort.
13. To learn from others and stimulate new ideas.
14. A review tells what others have found so that a researcher can benefit from the efforts of others.
15. A good review identifies blind alleys and suggests hypotheses for replication.
16. It divulges procedures, techniques, and research designs worth copying so that a researcher can better focus hypotheses and gain new insights.

By Ayesha Aish

17. Important variables that are likely to influence the problem situation are not left out of the study. Helps in developing theoretical framework.

Types of Reviews

18. There are six types of review.
19. Self-study reviews increase the reader's confidence.
20. A review that only demonstrates familiarity with an area is rarely published but it often is part of an educational program.
21. In addition to giving others confidence in a reviewer's command of field, it has the side benefit of building the reviewer's self-confidence.
22. Context reviews place a specific project in the big picture.
23. One of the goals of review is creating a link to a developing body of knowledge. This is a background or context review.
24. Goals of review introduces the rest of a research and establishes the significance and relevance of a research question.
25. It tells the reader how a project fits into the big picture and its implications for a field of knowledge.
26. The review can summarize how the current research continues a developing line of thought, or it can point to a question or unresolved conflict in prior research to be addressed.
27. Historical review traces the development of an issue over time.
28. Researchers conduct historical review only on the most important ideas in a field.
29. Theoretical reviews compare how different theories address an issue.
30. In addition to examining the consistency of predictions with findings, a theoretical review may compare theories for the soundness of their assumptions, logical consistency, and scope of explanation.
31. Researchers also use it to integrate two theories or extend a theory to new issues. It sometimes forms a hybrid – the historical theoretical review.
32. Integrative review summarizes what is known at a point in time. It presents the current state of knowledge and pulls together disparate research reports in a fast-growing area of knowledge.

By Ayesha Aish

33. Methodological reviews point out how methodology varies by study. In it researcher evaluates the methodological strength of past studies.

34. It describes conflicting results and shows how different research designs, samples, measures, and so on account for different results.

35. **Research Literature can be find from (All of the given below)**

• Computer: on line systems.

• Scholarly journals.

• Books – containing reports of original research, or collection of research articles. READERS or Book of Readings.

• Dissertations.

• Government documents.

• Policy reports and presented papers.

• Bibliographic indexes.

By Ayesha Aish

Lesson No;-10

1;-Locating research report depends on the type of report or outlet of research being searched.

2;-Using multiple search strategies in order to counteract the limitations of single searched method.

3;-Many social and behavioral research is published in scholarly journals.

4;-Many academic fields for the scholarly literature keep abstracts or indexes.

5;-In computer based searches we can use six to eight keywords.

15

6;-Skepticism is the norm of science.

7;-Author should communicate a review's purpose to the reader by its organization.

8;-Communication is more effective when it tailored to a specific audience.

"BT406 - Research methodology and Skill enhancement"

16

Leacture # 11 :-

1. A concept is an idea expressed as a [Symbol or in word]
2. Natural Science concepts are often expressed in [Symbolic form]
3. Social Science concepts are expressed in [Words form].
4. Word height refers to an [Abstract] idea.
5. People can express the abstract idea to one and other using the [Symbol].
6. Abstraction of reality are [Concepts]
7. Abstract Concept refferas to the idea that have a [diffuse, indirect expressions]
8. The organization of concept in sequence from most [Concrete] to the most [general].
9. The Scientific researcher operates at two levels of concepts [Emperical and Variable]
10. Social Science concept from a Specilized language or [Jargon].
11. Dictionary defination are also called [Conceptual, theoratical and nominal].

BT: - 406 Lecture: - 12

1. A variable is defined as anything that varies or changes in value.
2. Variable generally is anything that may assume different numerical or categorical valves.
3. If the value of variable can be divided into fraction then we call it a continuous variable.
4. Continuous variable can take infinite number of value.
5. Any variable that has a limited number of distinct valves and which cannot be divided into fraction is a discontinuous variable.
6. Discontinuous variable also called a categorical variable or classificatory variable.
7. Some variable have only two values these variable referred to as dichotomous.
8. The cause variable or the one that identifies forces or conditions that act on something else is the independent variable.
9. The variable that is effect or is the result or outcome of another variable is the dependent variable.
10. Dependent variable is also referred to as criterion variable.
11. In statistical analysis a variable is identified by the symbol (X) for Independent variable.
12. In statistical analysis a variable is identify by symbol (Y) for dependent variable.
13. A Moderating variable is one that has strong contingent effect on the independent variable dependent variable relationship.
14. In this relationship interest and inclination is moderating variable which moderate the strength of association between X and Y variables.
15. Intervening variable comes between independent and dependent variable.
16. In order to identify the true relationship between independent and dependent variable the effect of extraneous variable may have to be controlled.
17. Confounding factors is another name used for extraneous variables.

Advertisement

14. In this relationship interest and inclination is moderating variable which moderate the strength of association between X and Y variables.

15. Intervening variable comes between independent and dependent variable.
16. In order to identify the true relationship between independent and dependent variable the effect of extraneous variable may have to be controlled.
17. Confounding factors is another name used for extraneous variables.
18. A statement containing a variable is called a proposition.

19. The proposition with two variables is known as bivariate proposition.
20. The preposition having three or more variable are called multivariable preposition.

19

Lecture # 13

Objective

By Shazine Noor

MCQS

1. A theoretical framework is conceptual model of how one theorizes or makes logical sense of the relationships
2. Factors which may also be called as variables may have been identified through such processes as interviews with informants, observations, and literature survey.
3. The interrelationships among the variables that are considered to be integral to the dynamics of the situation being investigated.
4. Developing such a conceptual framework helps us to postulate or hypothesize and test certain relationships.
5. Testable hypotheses can be developed to examine whether theory formulated is valid or not.
6. The hypothesized relationships can thereafter be tested through appropriate statistical analysis.
7. The entire research rests on the basis of the theoretical framework.
8. If the testable hypotheses not necessarily generated, developing a good theoretical framework is central to examining the problem under investigation.
9. There is a relationship between the literature survey and the theoretical framework.
10. The former provides a solid foundation for developing the latter.
11. Literature survey helps in the identification of the relevant variables, as determined by the previous researches.
12. In addition to other logical connections that can be conceptualized forms the basis for the theoretical mode.

13. The theory underlying these relations, and describes the nature and direction of the relationships.
14. A theoretical framework:
    - Elaborates the relationship among the variables.
    - Explains the logic underlying these relationships.
    - Describes the nature, and direction of the relationships.

15. Theories are supposed to be generic
16. Theories may have to be replaced with arguments, logic explicated, and the framework may be readily available.
17. For developing a rigorous logical argumentation for the interrelationships among different variables.
18. The researcher uses a ready-made theoretical framework or explicates an entirely new one.
19. These features may be called as components of a theoretical framework.
20. The whole discussion can be portrayed in a schematic diagram.
21. There are six basic features that should be incorporated in any theoretical framework.
22. Factors are the empirical realities which can be named at some abstract level called concepts.
23. The concepts taking more than one value are the variables.
24. The researcher makes an inventory of relevant variables.
25. There should be an indication in the discussion as to whether the relationship should be positive or negative.
26. The discussions should state how two or more variables are related to one another.
27. Stipulation of logical relationship between any two variables means the formulation of a proposition.
28. Call a collection of propositions as an inventory of propositions.
29. Each proposition is backed up by strong theoretical argumentation.
30. Arrange these propositions in a sequential order: one proposition generates the next proposition.
31. Sequentially arranged set of propositions which are interlinked and interlocked with each other.

BT.406 M.C.Q.S

Lesson:-14 21 Sabaar Zahara

1. Descriptive hypothesis Contain only one variable.
2. Descriptive hypothesis are also called universal hypothesis.
3. Relational hypothesis Contain only two variable.
4. Cause means to help make happen.
5. The higher the motivation the higher the Efficiency.
6. There is no relation ship between the Variable or not the relation ship between the zero.
7. The null hypothesis is denoted as "Ho"
8. Alternative hypothesis is denoted as Desefect.

Alternative hypothesis is Indicated by the numbere 1.

9. Research hypothesis is associat with their Level of hypoth ises.

10. Hypothesis should be clearly defined.

11. The nature of relationship is not specified in non-directional.

12. The direction of Relationship between two variable is Positive.

13. Hypothesis should be related to a body of a theory.

Lecture no 15

23

BT 406 **Hafiza Fariha Shah**

1: A proposition that can be verified to determine its reality is a____ **(hypothesis).**

2: Hypothesis is a_____ of a proposition. **(verifiable counterpart)**

3: Descriptive hypothesis also called as _____ **(univariate hypothesis)**

4: Researchers usually use _____rather than descriptive hypothesis. **(research questions)**

5: Relational Hypothesis describe a relationship between_____ **(two variables)**

6: Level of job commitment of the officers is positively associated with_____ **(their level of efficiency)**

7: Cause means to_____ **("help make happen.")**

8: Hi motivation causes_____ **(hi efficiency).**

9: Hi motivation _____hi efficiency. **(influences)**

10:_____is used for testing the hypothesis formulated by the researcher. **(Null Hypothesis)**

11: Symbolically null hypothesis is denoted as ____ **("H0").**

12: Rejection of the null hypothesis leads to the acceptance of the---- **(alternative hypothesis.)**

13: If there is a relationship between the variables under study, called____ **(Alternative Hypothesis)**

14: the alternative hypothesis is symbolically denoted as____ **("H1").**

Lecture no 15

15: _____ There is a relationship between the level of job commitment of the officers and their level of efficiency. **(H1)**

16: _____ is the actual hypothesis formulated by the researcher which may also suggest the nature of relationship i.e. the direction of relationship. **(Research hypothesis)**

17:_____ suggests which form of research design is likely to be the most appropriate. **(hypothesis)**

18: Hypothesis must be _____ **(conceptually clear).**

19: The variables contained in the hypothesis should be_____ **(empirical realities).**

20: The global use of the word _____may not tell much. **('urbanization')**

21: Hypothesis should be related to a_____ **(body of theory).**

22: For _____the researcher shall depend on the existing body of knowledge. **(the development of a framework)**

❖ Lecture 18 by Tehreem

1.Experiments are judged by two measures.

2.The first, internal validity indicates whether the independent variable was the sole cause the change in the dependent variable. It implies the researcher's ability to eliminate alternative explanations of the dependent variable.

3. The second measure, external validity, indicates the extent to which the results of the experiment are applicable in the real world.

4.**Internal validity** is high in the laboratory experiment, reason being the control over all the confounding factors. External validity (generalizability) is not sure because of the effect of variety of factors.

5. **Field experiments** have more external validity but less internal validity because it is closer to the real situations.

6. In choosing or **evaluating experimental research design,** researchers must determine whether they have **internal and external validity**

7.. There are **eight** major types of extraneous variables that may jeopardize internal validity: History effect, maturation effect, testing effect, instrumentation effect, selection bias effect, statistical regression, mortality, and mechanical loss.

8.Maturation Effect: **C**ause and effect relationship can also be contaminated by the effects of the passage of time – another uncontrollable variable. Such contamination is called maturation effect.

9.The maturation effects are a function of the processes – **biological and psychological – operating within the subjects as a result of the passage of ti**me. Examples of maturation processes could include *growing older, getting tired, feeling hungry, and getting bored.*

10.Testing Effects: Frequently, to test the effects of treatment, subjects are given what is called a *pretest* (say, a short questionnaire eliciting their feelings and attitudes). That is, a measure of the dependent variable is taken (pretest), then the treatment given.

11.the very fact that the subjects were exposed to the pretest might influence their responses on the posttest, which will adversely impact on internal validity. It is also called sensitization through previous testing.

12. Instrumentation Effects: Instrumentation effects are yet another source of threat to internal validity.

A change in the wording of questions (may be done to avoid testing effects), change in interviewers, or change in other procedures to measure the dependent variable can cause instrumentation effect. Performance of the subjects measured by the units of output in the pretest, but when measuring the output in posttest the researcher measures it by the number of units rejected,.

13.selection Bias Effect: Selection bias is the threat that subjects will not form equivalent

Lec# 18

1: Experiments are judged by____ measures. **(two)**

2: _____indicates whether the independent variable was the sole cause of the change in the dependent variable. **(internal validity)**

3: _____, indicates the extent to which the results of the experiment are applicable in the real world. **(external validity)**

4: Field experiments have more external validity but less internal validity because _____ **(it is closer to the real situations).**

5: There are _____major types of extraneous variables that may jeopardize internal validity. **(eight)**

6: Advertisement of a particular product (mineral water) and its sale is affected by_____. **(an event in the society)**

7: The researcher does not have control on such happenings which have an impact on the _____relationship. **(X and Y)**

8: Cause and effect relationship can also be contaminated by the effects of the passage of time – another uncontrollable variable. Such contamination is called_____ **(maturation effect).**

9: An R & D director intends that an increase in the efficiency of workers would result within_____ . **(three months)**

10: The difference between the _____scores is then attributed to the treatment. **(posttest and the pretest)**

11: The subjects were exposed to the pretest might influence their responses on the posttest, which will adversely impact on internal validity. It is also called____ **(sensitization through previous testing).**

12: A change in the wording of questions (may be done to avoid testing effects), change in interviewers, or change in other procedures to measure the dependent variable can cause____ . **(instrumentation effect)**

13: ____is the threat that subjects will not form equivalent groups. **(Selection bias)**

14: Selection Bias Effect occurs when subjects in one experimental group have a characteristic that affects_____ **(the dependent variable).**

15: ____is a problem of extreme values or a tendency for random error to move group results towards the average. **(Statistical Regression)**

16: The phenomenon of low scorers tending to score closer to the mean is known as_____ "**(regressing toward the mean)**."

17: _____arises when some subjects do not continue throughout the experiment. **(Mortality, or attrition)**

18: Mortality means_____. **(death)**

19: A problem may be experienced due to equipment failure is ____ . **(Mechanical Loss)**

20: _____is designed to control experimenter expectancy. **(The double-blind experiment)**

21:_____, a specific kind of reactivity to the experimental situation is a good example in this respect. **(The Hawthorn Effect)**

22: Productivity rose after each____ **(modification).**

23: Demand characteristic is another type of _____ **(reactivity).**

24: In order to protect the rights of participating subjects the research institutions have usually set up_____ **(Ethics Committees).**

lecture → 19

1) A ___ is a subset or some part of a larger whole (Sample)

2) A complete group of entities sharing some common set of characteristics is (population)

3) ___ are a scarce commodity (professional fieldworkers)

4) The characteristics of the blood can be determined on the basis of ___ (Sample)

5) Samples may be more accurate than (Census).

6) When the elements of population are (highly homogenous) samples are highly representative of the population.

8) In a Census study of large population there is a greater likelihood of non-sampling ____ (errors)

32

9) Many research projects, especially those in quality control ____ (testing)

9) In ____ testing the life of bulbs. If we were burn every bulb produced, there would be none left to sell. (destructive sampling)

10) ____ there are numbers of technical terms used in books on research and Statistics which need explanation (Sampling terminology)

11) An element is that unit about which information is collected and which provides the basis of (analysis)

12) A population is the theoratically specified aggregation of study element It is translating of abstract concept into (workable concept)

13) _____ population is the complete group of specific population elements relevant to the research project. (Target)

14) Target population may also called _____ (Survey population)

15)

16

17)

18)

15) A sampling unit is that _____ considered for selection in some stage of sampling
(element or set of elements)

16) Sampling may be done _____ stages
(Single or multiple)

17) Sampling Units may be _____
(employed)

primary

18) The terms 1 sampling units Secondary sampling units and final sampling units would be used to designated the _____ stages
(Successive)

19) An observation unit or unit of _____
(data collection)

20) A _____ is the summary description of a given variable in a population.
(parameter)

21) Sample statistics are used to make estimates of the _____ (population parameters)

22)

❖ Lecture 20 by Tehreem

36

1. **Major alternatives of sampling are probability and non non zwro probability**
2. **Every element has a known non zero probablity of selection**
3. Projecgra sampling.ting data beyond sampling is statistically inappropriate
4. Convenience sampling is a non probability sampling also called haphazard or accidental or grab sampling
5. Person on t.v. interviewed by people is personal judgement
6. Perpusive sampling is also called judgmental or expert opinion sample. Selection depends on the selector
7. The sampling that ensures certain characteristic of population sample will be represented is Qouta sampling
8. Qouta sampling can be said as a proportionate statified sampling
9. It ensures the inclusion subset when it is under represented
10. Snowball sampling also called chain referral, chain, reputational sampling . It is used where it is difficult for respondents to identify.
11. **Sequential sampling** is similar to purposive sampling
12. In sequential sampling, continuation of evaluation of data, it stops when new data is coming
13. **Theoretical sampling researchers selects cases on his own insight . Used in observational studies.**

Bt406

wish

- **Researcher must identify**---- sampling element.
- Probability sampling can determine the relationship between_____ sample & population.
- Develop an accurate sampling frame in_____ simple random sampling.
- Short cut for simple random sampling _____systematic random sampling.
- selection of elements within the selected clusters._____ random.
- _____ within cluster but_____ between cluster,-------(heterogeneity, homogeneity)
- ___-___ sampling usualy multistage------(cluster sampling)
- When we want to examine the matter in more detail._____(double sampling)
- In double sampling_____ of the primary sample---(sub sample)
- Read it
- Appropriate sample design depend upon criteria like ___Degree of accuracy, Resources, Advance knowledge of population, National vs. local project. Geographic proximity of population, Need for statistical analysis. Projecting beyond the sample or the sample only.

❖ I am highly thankful to my precious team for their Hard work.

❖ I will suggest all of my readers that prepare your handout thoroughly and deeply read them carefully

❖ Wish you best luck for Grand quiz. Remmber us in your precious prayers
