CS 101 updated Final Terms

Subjective

1. What is Cyber Crime?

Crimes committed with the use of computers or relating to computers, especially through the Internet. Universally, Cyber Crime is understood as "an unlawful act where in the computer is either a tool or a target or both". Cyber Crimes are different from conventional crimes as in cyber crimes; the crime is committed in an electronic medium and here mens rea is not a requirement but is rather a general rule under the penal provisions of the Information Technology Act. The element of mens rea in Internet crimes is that the offender must have been aware at the time of causing the computer to perform the function that the access thus intended to be secured was unauthorized.

2. What is the use of Ms Access?

MS Access is a Data Base Management System (DBMS) by Microsoft.A DBMS is a software package by which you can develop a database. You can insert, delete and update data into that database. You can develop reports and forms too.

3. Differentiate between 3-D and 2-D?

2D Graphics means showing graphics in two axis. Most of the graphics you see are 2D Graphics. 3D Graphics means showing Graphics in 3 axis.

4. What is Robotics?

Automatic machines that perform various tasks that were previously done by humans. Example: –Pilot-less combat airplanes –Land-mine hunters –Autonomous vacuum-cleaners.

5. What are MVS & VMS?

MVS is an operating system for mainframe computers. Both VMS and MVS are multi-user operating systems.

6. What is the use of SDLC?

System Development Life Cycle (SDLC) is the overall process of developing information systems through a multi step process from investigation of initial requirements through analysis, design, implementation and maintenance.

7. What are bitmap graphics and vector graphics and difference between them?

In Vector Graphics A shape maintains its identity i.e. it doesn't mix in other shapes. Shapes of Vector Graphics are independent of Resolution. Size of Vector Graphics files is very small. In bitmap Graphics A shape does not

VU Medical Zone effort by Amaan Khan

maintain its identity i.e. it is mixed in other shapes. Shapes of Vector Graphics are not independent of Resolution i.e. they lose quality on different resolution. Size of Vector Graphics files is not much small.

8. What is the difference between "Compiler" and "Interpreter"? (V.IMP)

A compiler is a special program that processes statements written in a particular programming language (source code) and turns them into machine language or "code" that a computer's processor uses. Compiler converts the source code into object code only once. It doesn't need every time this conversion while execution. Interpreter does the same thing but it converts the code line by line each time while executing the program.

9. What is difference between Design and Architecture?

The software architecture of a program or computing system is the structure or structures of the system, which comprise software components, the externally visible properties of those components, and the relationships among them. By "externally visible" properties, we are referring to those assumptions other components can make of a component, such as its provided services, performance characteristics, fault handling, shared resource usage, and so on. The intent of this definition is that a software architecture must abstract away some information from the system (otherwise there is no point looking at the architecture, we are simply viewing the entire system) and yet provide enough information to be a basis for analysis, decision making, and hence risk reduction. First, architecture defines components. The architecture embodies information about how the components interact with each other. This means that architecture specifically omits content information about components that does not pertain to their interaction.

10. What is the difference between the application & system softwares? (V.IMP)

System software is program that generally performs the background tasks in a computer. These programs, many times, talk directly to the Hardware e.g. Operating system software, Device drivers while Application software are programs that generally interact with the user to perform work that is useful to the user. These programs generally talk to the hardware through the assistance of system software e.g., scientific, business application.

11. What is the different between HYPERLINK and HYPER MEDIA?

Essentially, hypermedia is the modern extension of hypertext, the hyperlinked, text–based documents of the original Internet. Hypermedia attempts to offer a working and learning environment that parallels human thinking—that is, one in which the user can make associations between topics, rather than move sequentially from one to the next, as in an alphabetic list. An image or portion of text on a Web page that is linked to another Web page, either on the same site or in another Web site is called Hyperlink. via email means through email.

12. What is difference b/w JavaScript, JScript and HTML ?

JavaScript is a platform-independent, event-driven, interpreted programming language developed by Netscape Communications Corp. and Sun Microsystems. JavaScript is useful for adding interactivity to the World Wide Web because scripts can be embedded in HTML files (i.e., web pages) simply by enclosing code in a tag pair. All modern browsers can interpret JavaScript -- albeit with some irritating caveats. (More about them below).In practice, JavaScript is a fairly universal extension to HTML that can enhance the user experience through event handling and client-side execution, while extending a web developer's control over the client's browser. JScript is

VU Medical Zone effort by Amaan Khan

approx. same except it is from Microsoft Corporation. HTML stands for the HyperText Markup Language. HTML is the major language of the Internet's World Wide Web. Web sites and web pages are written in HTML. With HTML and the world wide web, you have the ability to bring together text, pictures, sounds, and links... all in one place! HTML files are plain text files, so they can be composed and edited on any type of computer... Windows, Mac, UNIX, whatever.

13. What is a word processor?

A program used to create, format, modify, save for later use and print documents. The key advantage of word processor is its ability to make changes easily, such as correcting spelling, changing margins, or adding, deleting, and relocating entire blocks of text. Once created, the document can be printed quickly and accurately and saved for later modifications.

14. What is firewall?

A firewall is a security-conscious piece of hardware or soft-ware that sits between the Internet and your network with a single-minded task: preventing them from getting to us. The firewall acts as a security guard between the Internet and your local area network (LAN).

15. Please explain the Turning Machine in a bit detail. How did it play part in evolution of computer?

It was introduced by Alan Turing in 1936, Turing machines are one of the key abstractions used in modern computability theory, and the study of what computers can and cannot do. A Turing machine is a particularly simple kind of computer, one whose operations are limited to reading and writing symbols on a tape, or moving along the tape to the left or right. The tape is marked off into squares, each of which can be filled with at most one symbol. At any given point in its operation, the Turing machine can only read or write on one of these squares, the square located directly below its "read/write" head.

16. What is word processing and desktop top publishing?

The art and science of converting written information into a form that looks pleasing when printed is called Word Processing. A combination of word processing and graphic design is called Desktop Publishing. Used to develop elegant documents –Examples: •Adobe PageMaker •Quark Press •Corel Ventura •MS Publisher

17. What is the difference between "Object based Language" and "Object Oriented Language"?

Object oriented language supports inheritance, polymorphism etc, while object based don't. Object based languages use objects having their attributes / properties which can be modified according to our requirements.

18. What is a Webpage?

A web page is nothing more than a file, a HTML file to be exact. It's called HTML because web page documents have the file extension .html or .htm.

19. Why JavaScript variables are dynamically typed?

VU Medical Zone effort by Amaan Khan

EFFORT BY AMAAN KHAN

Dynamically typed variables can hold any type of data and it could contain data of different type midway of program. It is simple to develop for short programs. As your question is concerned, I would like to say that each programming language has its own features depending on the requirements of the tasks for which that particular language is developed.

20. What are the classifications of Cyber Crime?

Tampering with computer source documents: Hacking: Publishing of information, which is obscene in electronic form accessing protected system Breach of confidentiality and privacy.
