Virtual University Overseas Examination System V2.1 (x86)

Computer Networks (Practical) (CS610P)

Question: 27 (Marks: 5)

Following table contains different IP addresses. You are required to mention the class of each given IP address.

IP Address	Class Of IP Address
10.5.30.4	
241.0.0.1	
192.168.32.15	
138.4.4.87	
237.1.0.9	

Q27

- 10.5.30.4: Class A
- 241.0.0.1: Class E
- 192.168.32.15: Class C
- 138.4.4.87: Class B
- 237.1.0.9: Class D

Virtual University Overseas Examination System V2.1 (x86)

Computer Networks (Practical) (CS610P)

Question: 28 (Marks: 5)

Consider the IP address 195.2.0.5/29 and provide the following information:

- Total number of subnets
- Total number of useable hosts

Q28

The IP address 195.2.0.5/29 belongs to a subnet with a prefix length of 29 bits. Let's break this down:

Calculating Total Number of Subnets

The '29' prefix length means that the subnet mask has 29 bits set to 1. In IPv4, there are 32 bits total. Thus, the subnet mask is:

11111111.11111111.11111111.11111000

The remaining bits are for host addresses.

$32 - 29 = 3$ bits for hosts.

Calculating Total Number of Hosts per Subnet

With 3 bits available for host addresses:

Answer:

$2^3 = 8$ total addresses

However, two addresses are reserved in each subnet: one for the network address and one for the broadcast address. So, the number of usable host addresses is:

$8 - 2 = 6$ usable addresses
