

ENG509

MIDTERM PRAPERATION FILE 2024

IMPORTANT SHORT AND LONG QUESTION

LINGUIST STUDY ZONE

- foundational beliefs about linguistics that languages **differ from** one another.
- **Clipping** is the creation of a new word by truncation of an existing one.
- 'fish (sg)' and 'fish (pl)', we cannot posit a zero plural.
- **Greek**: morph- means 'shape, form' • **Morphology** is the study of form or forms.
- The **smallest** linguistic pieces with a grammatical function.'
- **Stem**: 'A stem is a base unit to which another morphological piece is attached,
- **Morphology** is a distinct component of languages or grammars.
- **Albert Einstein** said that a physicist must be both a realist and a nominalist
- morphemes are **segmental**
- A morpheme may have zero as one of its allomorphs provided it has a **non-zero allomorph**.
- single word can have **multiple** uses and interpretations.
- Words like noun, verb, adjective, and adverb refer to what linguists call **lexical category**
- smallest unit of language that can **stand alone**.
- Affixes: units incapable of **standing alone**
- Words tend to be important units **phonologically** as well as **syntactically** • Linguists distinguish phonological **words**, **grammatical** words and **lexemes**.
- **phonological** word has a main stress.
- phonologically dependent on adjacent words, are called **clitics**.
- clitics pattern like distinct words, but they cannot stand alone phonologically. **Proclitics**
- clitics pattern like distinct words, but they cannot stand alone **phonologically**.

- **lexeme** is a theoretical construct that corresponds roughly to one of the common senses of the term word.
- **morphemes** in a word, we generally end up with something **ungrammatical**.
- **Words** differ from larger unit.
- **Inflection** involves the formation of grammatical forms – past, present, future; singular, plural.
- **Regular verb** lexemes in English have a lexical stem.
- **Derivation** involves the creation of one lexeme.
- Morphology is the arrangement of these morphemes into a **particular** order or **structure**.
- Greek **lexikós** ‘pertaining to words’ and often designates a book containing a list of words in a language along with their **definition**.
- **Meaning** of a complex word is the sum of the meaning .
- interactions and the grammar that describes them are often called **morphophonology** or **morphophonemics**.
- Readers to have the rudimentary knowledge of **linguistics**
- three terms that are **onset**, **nucleus**, and **coda**.
- **three allomorphs** of the plural suffix depend on phonological context. The last two, as in **oxen** and **sheep**, are **lexical**.
- Three allomorphs is **predictable**.
- Prosodic morphology deals with the interaction of **morphology** and **prosodic structure**.
- **Prosodic structure** is particularly concerned with the timing units of languages.
- **Phonotactics** is a branch of phonology that deals with restrictions in a language on the permissible combinations of phonemes.
- Semitic languages, roots consist of three consonants: **CCC**
- **morphologists** is to use the symbol ‘+’ to mark the juncture between a stem and a primary affix .
- **Hock** gives the example of English plurals.
- four-part analogy that the plural of cow is cows, replacing the earlier form **kine**.
- One secret language is **Pig Latin**.
- Verlan [vɛɾlɑ̃], based on **French**.
- **Ferdinand de Saussure** one of the first modern linguists.
- **sign, signifier, and signified**, are still standard in linguistic.
- Motivation is related to the logical notion of composition or **compositionality**.
- A sign is motivated to the extent that by inspection you can get clues as to what it means.
- **Doghhouse** Its meaning is derivable from its two components.
- **Words** like this that are used but not stored are called nonce forms or hapax legomena.
- Derivational processes is not limited to **compounding, zero-derivation**, and **affixation**.
- Dependent on **orthography** rather than pronunciation.
- **FBI** differs from the other acronyms in in being pronounced letter by letter.
- **Clipping**: creation of a new word by truncation of an existing one.
- **Backformation**: the creation of a word by removing what appears to be an affix.
- There were **four** rows of seats.
- countable nouns in English have two word forms: a **singular** and a **plural**.

- you the two forms are **identical**.
- **Parasynthesis** constitutes a problem for morphological structures.
- **Suppletion** is said to take place when the syntax requires a form of a lexeme that is not morphologically predictable.
- **Bulgarian** imperfect and aorist paradigms, the second person singular and third person singular forms are **identical**.
- **England** was ruled for a long period after 1066 by a monarch and a nobility whose native language was a variety of French.
- **French** is one of the so-called Romance languages.
- **Universal Grammar** is the theory developed by Noam Chomsky that states that all languages are identical at some level of analysis.
- **morphological knowledge** is a battle ground for different theories about the nature of linguistic rules.
- **Germanic languages** borrowed many words from French, of culture, science, and diplomacy
- borrowing had its impact on the morphology of **Germanic languages**.
- **Complex words**, once they are coined, may be subject to reanalysis and reduction.
- word grammar is derived from **Greek**, which means "art of letters", from **γράμμα (gramma)**, "letter", itself from **γράφειν (graphein)**, "to draw, to write".

Q. Define morphology ?

Johann Wolfgang von Goethe (1749-1832)

Greek: morph- means 'shape, form',

Morphology is the study of form or forms

Q. In linguistics define "morphology ?

The mental system involved in word formation

Or

The branch of linguistics that deals with words, their internal structure, and how they are formed.

Q. Make noun phrases with

Determiner+noun: the village, a house, our friends

The village: "The" is a determiner that specifies a particular village. "Village" is the noun.
A house: "A" is a determiner that refers to any house, not a specific one. "House" is the noun.
Our friends: "Our" is a determiner that indicates the friends belong to "us." "Friends" is the noun.

Qualifier+ noun: some people, a lot of money

Examples:
Some people: "Some" is a qualifier that indicates an unspecified amount of people. "People" is the noun.
A lot of money: "A lot of" is a qualifier that indicates a large amount. "Money" is the noun.

Q. Separate borrowing word: gourmet, renaissance, ketchup, pizza, essence, **pen**, 5 marks

- **Gourmet**
- **Renaissance**

Gourmet (French)
Renaissance (French)
Ketchup (Chinese)
Pizza (Italian)
Essence (Latin)

The word "pen" is not included in the list of borrowed words as it has been fully integrated and altered in English over time.

- Ketchup
- Pizza
- Essence

Q. Write verbs ie. Repaint derived from paint (3 marks)

Painting Paints Painted

Repaint: To paint something again.

Painting: The present participle of "paint," used to describe the ongoing action of applying paint.

Painted: The past tense of "paint," used to describe an action that has already been completed.

Q. separate in to morphemes (5)

1-Re---hash	Repaint: Re- + paint Painting: paint + -ing Paints: paint + -s Painted: paint + -ed	Painting paint (root) -ing (suffix indicating the present participle)	
2-in—sane			Painted paint (root) -ed (suffix indicating the past tense)
3-im—polite			
4-jump—ed	Repaint Re- (prefix meaning "again") paint (root)	Paints paint (root) -s (suffix indicating the third person singular present tense)	
5-attach—ed			

Q. Write any 5 prefixes which convey the meaning of negation

Impolite, unhappy, incomplete, illiterate, impatient

Dis-: This prefix means "apart," "away," or "not."

Example: Disagree (not agree)

Non-: This prefix means "not" or "without."

Example: Nonexistent (not existent)

Q. According to Fabregas & Scalise (2012)?

Morphology is the part of linguistics that studies grammatical properties of words and how words relate to each other in a language.

Q. The chief task of morphology:

- A. Deep The chief task of morphology is to understand how words are formed and how they change to convey different meanings. It's about looking at the parts of words (like roots, prefixes, and suffixes) to see how they fit together and create different forms and meanings. So, in your options:
- b. deepen Deep: It's a simple word without any changes. It's like the base form.
Deepen: This is the verb form of "deep." It's like adding something to make it stronger or more intense.
- C. dog Dog: It's a singular noun, just one dog.
Dogs: This is the plural form of "dog." It means more than one dog.
- b. dogs

Q. Define Morpheme ?

Morphologists investigate words:

A morpheme is the smallest meaningful unit of language. It's like a Lego block of meaning within a word. Morphologists, who study language, look closely at words to understand:

- Their internal structure How they are put together from smaller parts (like roots, prefixes, and suffixes).
How these parts combine to create different meanings.
- How they are formed. They also explore how words change form to express different ideas, like tense or pluralization.
Essentially, they dissect words to uncover their internal structure and how they are built.

Q. five names of inflection categories

- (1) number (singular, plural) Plural: It shows when there's more than one of something. For example, adding "-s" to "cat" makes it "cats."
 - (2) gender (masculine, feminine, neuter)
 - (3) case.(nominative, accusative, genitive, dative) Past Tense: It tells us when something happened in the past. For example, adding "-ed" to "walk" makes it "walked."
 - (4) tense (present, past, future) Comparative: It helps us compare things. For example, adding "-er" to "tall" makes it "taller" when comparing two things.
 - (5) voice (active, passive) Possessive: It shows ownership or belonging. For example, adding "'s" to "John" makes it "John's" to show something belongs to John.
- Progressive: It indicates ongoing actions. For example, adding "-ing" to "run" makes it "running" to show the action is happening now.

Q. Differentiate between dictionary and mental lexicon. (5Marks)

Lexical knowledge of a native speaker does not have the format of a dictionary. First, the number of lexical entries in a good dictionary is much higher than that in our individual mental list of words. There are many words that most speakers do not know. The passive vocabulary, the number of words that you understand. The active vocabulary, the set of words one uses in language production is much smaller. A dictionary is conservative by nature, and hence it will contain words from the past that nobody uses any more. Mental lexicon will always be ahead of the dictionary, and contains a substantial number of words that are not listed in dictionaries. New words (neologisms) are coined continuously, and dictionaries always lag behind. A second difference between a dictionary and the mental lexicon is that words in the mental lexicon bear a number of relationships to each other. Words with similar meanings or similar phonological forms appear to be related in the mental lexicon, as can be concluded from speech errors. Someone talking about the sympathy of a musical conductor used the word symphony instead of sympathy. In a dictionary, semantic relations between words are usually not expressed directly. The mental lexicon as a multidimensional web of words, with all kinds of connections between those words: semantic similarities, phonological similarities, and morphological relationships. In a dictionary, words have one type of relationship only, that of alphabetical ordering. This ordering is based on the degree of orthographical similarity between words. A third difference between a dictionary and a mental lexicon is that the latter also stores information about the frequency with which you come across a word. Linguists may compute the frequency of words on the basis of large corpora of actual language use.

Q. Define the term right headed compound

All these compounds have a verb as the rightmost element, and also that, with most of them, the activity denoted by the compound as whole is a variety of the activity denoted by that rightmost element. Let us call these compounds right-headed, the rightmost element being the head. Most English compounds are right-headed, but not all. As with verbs, it is the type with the preposition over as its first element that seems most productive, in that new adjectives of this type, with the meaning 'too X', are readily acceptable: for example, overindignant, oversmooth.

Example:

1. **Noun–adjective (NA):** sky-high, coal-black, oil-rich
2. **Adjective–adjective (AA):** grey-green, squeaky-clean, red-hot
3. **Preposition–adjective (PA):** under full, overactive

Headedness Compound:

"Headedness" refers to the structural property of a compound where one element is more important or dominant than the other. It emphasizes the asymmetrical relationship between the elements, where one acts as the head and the other as a modifier or specifier.

Q. Headed and headless compounds with examples

In English grammar, a compound noun (or nominal compound) is a construction made up of two or more nouns that function as a single noun. With somewhat arbitrary spelling rules, compound nouns can be written as separate words like tomato juice, as words linked by hyphens like sister-in-law or as one word like schoolteacher. A compound noun whose form no longer clearly reveals its origin, such as bonfire or marshall, is sometimes called an amalgamated compound; many place names (or toponyms) are amalgamated compounds — for example, Norwich is the combination of "north" and "village" while Sussex is a combination of "south" and "Saxons." One interesting aspect of most compounds nouns is

Headed Compound: In a headed compound, one element serves as the central or primary component, known as the "head," while the other element provides additional information or specification. For instance, in "blackbird," "bird" is the primary focus, and "black" specifies the type of bird.

that one of the origin words is syntactically dominant. This word, called the headword, grounds the word as a noun, such as the word “chair” in the compound noun “easychair.”

Q. Any 5 names of parts of speech of English language

1. NOUN
2. VERB
3. PARTICIPLE
4. ARTICLE
5. PRONOUN

Q. Define term **Grammaticalization**. (imp)

‘The process by which a frequently used sequence of words or morphemes become automated as a single processing unit’ (Bybee 2003: 603). [G]rammaticalization is that subset of linguistic changes through which lexical item in certain uses becomes a grammatical item, or through which a grammatical item becomes more grammatical’ (Hopper and Closs Traugott 1993: 2). An example of the change from lexical to grammatical item is the development of verbs into auxiliaries. In English the verb to have not only functions as a main verb, with the meaning “to possess”, but also as an auxiliary in perfect tense forms. The verb can has lost its status as lexical verb completely, and functions as a modal auxiliary only. In these examples grammaticalization does not create morphology. This does happen if a (lexical or grammatical) morpheme becomes an affix.

Q. **Innateness** Hypothesis (IMP)

We are born with set of rules about language in our brains. Children are equipped with an innateness template or blueprint for language and this blue print aids the child in the task of constructing a grammar for their language. This is known as Innateness Hypothesis.

Q. **Suppletion**

In morphology, suppletion is the use of two or more phonetically distinct roots for different forms of the same word, such as the adjective bad and its suppletive comparative form worse. Examples and Observations “Bad – worse is a case of suppletion. Worse is clearly semantically related to bad in exactly the same way as, for example, larger is related to large, but there is no morphological relationship between the two words, i.e. there is no phonetic similarity between them.” (J.R. Hurford et al., Semantics: A Coursebook, 2nd ed. Cambridge University Press, 2007)

Q. Name the categories for which nouns are inflected.

The four basic categories are listed below:

Persons: baker, dancer, gambler, driver

Animals: pointer, retriever, warbler, trotter

Material objects: blotter, eraser, fertilizer, shutter

Immaterial objects: reminder, clincher, thriller, eyeopener

Q. Under line noun phrase (3) i-People like to have money

ii-I am tired iii-It

is getting late

Q. write words by clipping them

i-Advertisement Ad

ii-Examination Exam

iii-Gasolene gas

Q. Write three plural like ox..oxen,

1. Maid= maiden,
2. Fox= foxen,
3. Child= children

Q. Write two words where come (z) voice

- BOYS
- TOYS

Q. Correct labels for the snake swallowed it, on the road (V. IMP)

- The snake: Noun phrase,
- Swallowed: Verb,
- Object, On the road
- Adverb of place

Q. Place the correct labels in follow a new car followed

- A new car:
- noun phrase
- followed: verb

Q. Write three foundational beliefs on linguistics

First, we believe that languages differ from one another.

Second, that language, which we can write with a small l, is different from Language; with a capital L. Individual langs have features that are not characteristic of Language in general. Linguists need to pay equal attention to both small-l language and capital-L Language

'The smallest linguistic pieces with a grammatical function.

Morphemes are the smallest meaningful units in a language. Free morphemes can stand alone as words (Examples: "cat," "book," "run." and "House", while bound morphemes must attach to other morphemes to convey meaning or perform a grammatical function (Prefixes like "un-" in "unhappy." Suffixes like "-ed" in "played." and suffix "-ing" in "running"). These tiny pieces are the building blocks of words, helping to create the complex structures we use in language.

Root Compound: Both parts of the compound are root words, not derived from other forms like verbs.

Unpredictable Meaning: The exact meaning of the compound is not always directly derived from the individual meanings of the words involved.

Sunflower:

Sun (root) + Flower (root)

A "sunflower" is a type of flower that often follows the direction of the sun. The name doesn't immediately tell you this flower's unique characteristic.

Q. Example of root compounding

Call a NN compound like hairnet or mosquito net, in which the right-hand noun is not derived from a verb and whose interpretation is therefore not precisely predictable on a purely linguistic basis, a primary or root compound.

Q. Point out agent and predicate compliment in sentence John smokes cigarete

1. John (agent)
2. Smokes (predicate)
3. Cigarette (predicate)

non-seperatabily we can't put phrasal material in a sentence where in phrase we put extra material whenever we want. e.g a shirt to a white shirt this correct in english but non;seperatabily is broken by the insertion of segment or phrase material

Q. Explain Two basic approaches?

- Analysis
- Syntheetic

integrity we cannot apply syntactic principles on pieces of words. We can't break compound words like school bus to school - bus for integrity/non separability of compound words

Q. Define lexemes.

A **lexeme** is the smallest or minimal unit of lexicon in a language that bears some "lexeme has a morphological form, semantic content (or meaning) and a syntact Lexeme is basically an abstract notion used in linguistic morphology, the concrete n which is a word. One lexeme can take up more than one inflection to form a set of known as inflected variants. **For example**, the lexeme PLAY can take up many form playing, plays, and played.

Q. Morphemes with examples:

- Play-ed,
- Son-s.
- Wait-ing

Prosodic Morphology

Prosodic morphology deals with the interaction of morphology and prosodic structure. Prosodic structure is particularly concerned with the timing units of languages, for example, the word and syllable, and vowel length.

Primary and secondary affixes.

primary affixes are like the big changes we make to a word, while secondary affixes are like the extra details we add on afterward. They work together to give words their specific meanings and functions.

a. Mendel	→	Mendelian	Primary
b. Mongol	→	Mongolian	
c. c. Parkinson	→	Parkinsonian	
d. d. Shakespeare	→	Shakespearian	
e. grammar	→	grammarian	
f. Mendel	→	Mendelism	Secondary
g. Mongol	→	Mongolism	
h. Parkinson	→	Parkinsonism	
i. national	→	nationalism	

Q. Characteristic of primary affixes

1. Primary affixes cause a stress shift, while secondary affixes do not.
2. The primary affix will occur closer to the stem than the secondary affix.

Q. Define **lexemes**.

A lexeme is the smallest or minimal unit of lexicon in a language that bears some “meaning”. A lexeme has a morphological form, semantic content (or meaning) and a syntactic category. Lexeme is basically an abstract notion used in linguistic morphology, the concrete realisation of which is a word. One lexeme can take up more than one inflection to form a set of many words known as inflected variants. For example, the lexeme PLAY can take up many forms like play, playing, plays, and played.

Q. **Morphemes with examples:**

Play-ed, son-s, wait-ing

Q. Characteristic of primary affixes

1. Primary affixes cause a stress shift, while secondary affixes do not.
2. The primary affix will occur closer to the stem than the secondary affix.

Q. **Descriptive grammar**

A fully explicit grammar that exhaustively describes the grammatical constructions of a language is called a **descriptive grammar**

Q. Three limitations or constraints morphological process are:

1. **Phonological constraint**
2. **Morphological constraint**
3. **Semantic constraints**

Q. Morphological process constraints

these constraints are like rules or limitations that guide how words can be created or modified using morphological processes, ensuring that they follow the patterns and structures of the language.

1. **Productivity** can also be limited by **morphological constraints**.
2. A morphological process may **require the base to have a certain structure**, to belong to a certain morphologically or syntactically defined class, such as a gender, or to end in a particular affix.
3. **Verbs**.

Q. Verify compound structure Dry clean & steam clean

1. STEAM CLEAN : noun–verb (NV)
2. DRY CLEAN: adjective–verb (AV) **Q. Context free-inflection.**

Context-free inflection when there is a simple directional mapping between a morphosyntactic feature and a particular phonological string.

- As /-in/, refers to context-free inflection:
- All present participles in English bear the same suffix.

Q. Descriptive grammatical

A fully explicit grammar that exhaustively describes the grammatical construction Language is called a **descriptive grammar**

Q. Three limitations or constraints morphological process are:

1. **Phonological constraint**
2. **Morphological constraint**
3. **Semantic constraints**

Q. why children over extend the words tree/plants

Overextend tree by using it to refer to potted plants, trees, and even balsam fir wreaths. Such under- and overextensions are generally short-lived, which indicates that children revise lexical entries as they are exposed to more and more tokens of a word.

Q. what plural markers should we expect the English speakers will add in the following novel words

1. Argaz Argazzes Argaz: Since it ends in a consonant sound, the plural marker typically added is "-es." So, the plural form would likely be "Argazzes."
2. Smick: Smicks Smick: Words ending in a consonant sound often take the plural marker "-s." Therefore, the plural form would likely be "Smicks."
3. Brox: Broxes Brox: Similarly, words ending in a consonant sound often take the plural marker "-es." So, the plural form would likely be "Broxes."

Q. Name five auxiliary verbs?

The five most common auxiliary verbs are:

1. Can
2. Could
3. Shall
4. Would
5. Should.

Q. What are the three types of constraints of phonology?

Phonetics is divided into three types according to the

- (1) **production** (articulatory),
- (2) **transmission** (acoustic) and
- (3) **perception** (auditive) of sounds.

Q. Five examples of One-word noun noun phrase ?

- HOUSE House Plant: This phrase describes a type of plant that is typically kept indoors in a house.
- BOARD Board Game: This phrase refers to a game that is played on a flat surface like a board.
- Snow Snow Leopard: This phrase describes a type of leopard that lives in snowy regions.
- Chocolate Chocolate Cake: This phrase refers to a type of cake made with chocolate as the main ingredient.
- Book Book Club: This phrase describes a group of people who gather to discuss books.

Q: write three question words.

- Who
- What
- Which
- How

Q. Difference between **Direct and Indirect objects**?

The direct object is the receiver of the action mentioned in the sentence.... The indirect object identifies the person/thing for whom/what the action of the verb is performed. The indirect object is usually a person or thing. "John kicked the ball to his friend." In this revised sentence, "his friend" becomes the indirect object because they are benefiting from John's action of kicking the ball. So, "his friend" is the recipient of the action, and "the ball" remains the direct object.

Q. 3 lexical categories in the ?

The main lexical/substantive categories found in English

- Noun,
- Verb, • Adjective.
- Adverb
- Preposition

Q. Examples of adjective Phrase ?

- Very soft
- German
- Young

Q. Define **determiner** and name 4 types ?

A determiner is a word or affix that belongs to a class of noun modifiers that expresses the reference, including quantity, of a noun.

Determiner (D) traditionally said to include the definite article the and the demonstrative determiners This/that/these/those.

- Quantifiers
- Articles
- Demonstratives
- Possessives

Q write auxilliary verbs any 5 ?

BE, DO, HAVE, SHALL WOULD, COULD, CAN, SHOULD, OUGHT, MAY, MIGHT, MUST, WILL

Q. Noun **derived** from nouns

English has derivational processes that yield nouns with meanings such as 'small X', 'female X', 'inhabitant of X', 'state of being an X' and 'devotee of or expert on X'.

Here are some examples all of them must count as lexical items	unpredictable meanings
5) 'small X': -let, -ette, -ie	e.g. droplet, booklet, cigarette, doggie
(6) 'female X': -ess, -ine	e.g. waitress, princess, heroine
(7) 'inhabitant of X': -er, -(i)an	e.g. Londoner, New Yorker, Texan, Glaswegian

Q. **preposition** write with examples any 3

The preposition may be preceded by an element which specifies it. For example:

- (l) Right on the spot (adverb phrase)
- (ii) slap in the middle (adverb phrase)
- (m) straight through the wall (adverb phrase)

Q. defines the term **exocentricity** in the content of morphology.

Exocentric construction cannot be substituted for any of its element and thus has no head. For Example: Is not an expansion of with a or paper. Not an expansion of any of its parts. An exocentric construction cannot be substituted for any of its element and thus has no head.

Q. Explain linguistic junk

Rudes (1980) and Lass (1990) have both raised the question of what to do with “linguistic leftovers” or “linguistic junk” (Lass’s term). In both cases, it has to do with morphemes that lose their semantic content or morphosyntactic function as a result of language change and are left as content less, functionless strings of phonemes floating around in the system. They show that languages are in general intolerant of useless elements, and speakers reanalyze them as having a new role. Lass call this process lingic exaptation, extending a term of evolutionary biology to the study of lang change.

Q. Define Polosemey (3)

The most fundamental aspect of a word’s meaning is that it refers to some entity or relation (realor imaginary) in the world. We can refer to this entity or relation as the word’s semantic type. Formal approaches to grammar have provided us with terminology that allows us to make evenmore fine-tuned distinctions between words. The word reptile refers to all individuals in theworld that are reptiles. Verbs like respect or love refer to relationships between individuals. **Q. Three types of polysemy There are many types of polysemy.**

- (1) **Mass/count distinction** a. I love watermelon. (mass) b. I sold three watermelons. (count) (2) **Figure–ground reversal** a. Hugh broke the window. B. The kids climbed through the window.
- (3) **Container– contained** alternation a. A hot glass put under cold water will shatter. B. Franny downed the glass in two seconds flat

Q. Define mental lexcm(3 marks)

The mental lexicon is defined as a mental dictionary that contains information regarding a word’s meaning, pronunciation, syntactic characteristics, and so on. The mental lexicon is a construct used in linguistics and psycholinguistics to refer to individual speakers’ lexical, or word, representations.

Q. active vocabulary and Passive vocabulary

The number of words that you understand. The **active vocabulary**, the set of words one uses in lang production is much smaller. A dictionary is conservative by nature, and hence it will contain words from the past that nobody uses any more. Mental lexicon will always be ahead of the dictionary, and contains a substantial number of words that are not listed in dictionaries. New words (neologisms) are coined continuously, and dictionaries always lag behind.

Q. Difference between Syntax and Morphology

Syntax is the study of the formation of sentences and morphology is the study of the formation of words. The final aim of both these fields is to study how meaning is produced in language. The main diff bw morphology & syntax is that morphology studies how words r formed whereas syntax studies how sentences are formed. In this article, we’ll look at these fields in more detail.

Q. Write 2 common features of syntax in all langs? (if find anything else related to this please do share)

Syncretism is common cross-linguistically, and it raises a number of questions relevant to morphological theory. In the Bulgarian imperfect and aorist paradigms, the second person singular and third person singular forms are identical. (The aorist is a past tense.) Q. Explain the concept of **Regular inflection in nouns**:

It is a morphological process in which the forms of nouns are changed following the grammatical rules. Plurals of nouns can be formed by following various grammatical rules for making plurals.

Q. Irregular inflectional plural form

There are many instances in which the way a word is inflected doesn't seem to follow any rules or conventions at all—this is known as irregular inflection. For example, the past simple tense of the verb go is went (rather than goed, as regular inflection would suggest), and its past participle is gone. Irregular inflection affects nouns, adjectives, adverbs, and (most commonly) verbs child>children, tooth> teeth, man> men

Q. Explain zero derivation

Zero derivation, is a kind of word formation involving the creation of a word (of a new word class) from an existing word (of a different word class) without any change in form, which is to say, derivation using only zero. Zero-derivation changes the lexical category of a word without changing its phonological shape. A word formed by zero-derivation or any other productive derivational process becomes lexicalized: The English verbs: chair, leaf, ship, table, and weather.

Q. Define language And sign. Define Signifier and Signified

Signifier: Any material thing that signifies, e.g., words on a page, a facial expression, an image.

Signified: The concept that a signifier refers to Together, the signifier and the signified make up a meaning.

Sign: The smallest unit of meaning. Anything that can be used to communicate .

Q. Explain the concept of bracketing paradox briefly. (imp)

A crucial property of a structure is that both the formal and the semantic properties of the word need to be represented in the structure. For this reason, the situations where the semantic and the formal properties of an object do not coincide are problematic for the idea that words have internal structure. These situations are known as BRACKETING PARADOXES (Williams 1981, Beard 1991). There are three kinds of bracketing paradox

1. **One kind of bracketing paradox** is the situation in which the formal properties of one of the units requires it to combine with a particular base, but the meaning of the word suggests that it combines with a unit smaller than the base. **Take the word international.**

The formal properties of the word require the prefix inter- to combine with the adjective national, as the word *international does not exist in English

2. Another kind of paradox comes when a unit combines with a word but semantically modifies not only the word, but a bigger structure in which the word is included. Consider the expression

Page 14 of 16 A crucial property of a structure is that both the formal and the semantic properties of the word need to be represented in the structure. For this reason, the situations where the semantic and the formal properties of an object do not coincide are problematic for the idea that words have internal structure. These situations are known as BRACKETING PARADOXES

Vulgar Latinist. This does not refer to Latinist who happens to be Vulgar, but to someone who studies Vulgar Latin

3. Last kind of paradox take into account **phonological factors**. In the case **unhappy**, there is a paradox in the sense that the meaning of the adjective (more unhappy) require the suffix –er to combine with the trisyllabic adjective unhappy. It is known that generally trisyllabic adjective take the adverb more in the comparative. Avoiding this phonological infraction implies proposing that –er combines with happy and then un- is combines with happier. This gives the wrong semantics as it mean; not more happy’ which the speaker does not interpret. There is no analysis for bracketing in the general case which cover the three paradoxes

Q. Explain the **direct and indirect route with reference to morphological processing of a compound word.**

The insight that complex words are often stored as such in the lexicon raises the question of how they are processed. There are two ways in which a complex word can be processed, the direct route, and the indirect route. When perception of complex words is involved, the direct route means that we do not first parse the complex word, but go directly to its representation in the lexicon, in order to access its meaning. The indirect route means that a complex word is parsed into constituent morphemes, and that its meaning is computed after we have gained access to its constituent morphemes and their meanings. There are data that might be interpreted as showing that language users try to parse words into morphological sub constituents.

Q. Principle of morphological analysis

Morphological Analysis (MA) can also be referred to as ‘problem solving’. It is visually recorded in a morphological overview, often called a ‘Morphological Chart’. The method was developed in the 1960s by **Fritz Zwicky, an astronomer from Switzerland.**

Principle 1 Principle 1: Forms with the same meaning and the same sound shape in all their occurrences are instances of the same morpheme. Step one in morphological analysis is to look for elements that have the same form and the same meaning. This is the basic type-token problem.

- Forms with the same meaning and the same sound shape in all their occurrences are instances of the same morpheme.

Principle 2 Principle 2: Forms with the same meaning but different sound shapes may be instances of the same morpheme if their distributions do not overlap. When two or more instances of a given morpheme occur with different shapes, we call them allomorph.

- Forms with the same meaning but different sound shapes may be instances of the same morpheme if their distributions do not overlap.
- Seat-/s/

Principle 3 : Principle 3: Not all morphemes are segmental. Normally, when we think of morphemes, we think of forms that can be pronounced in some sense, e.g., chicken, the, un-, -ize. But some morphemes can't be pronounced on their own. They are dependent on other morphemes for their realization.

Not all morphemes are segmental.

Morphemes, can be pronounced in some sense, e.g., chicken, the, un-, -ize. Two types of words Words may be defined in different ways from different perspectives, with each perspective picking out a somewhat different object. Linguists distinguish words as

1. Phonological words, 2. Grammatical words

principle 4: Zero Allomorphs

What it means: Sometimes, a morpheme can be represented by nothing (zero) if there are other forms to compare it with.

Example:

"fish" (singular) and "fish" (plural) – The plural form doesn't change, so it's a zero allomorph.

3. Lexemes.

Q. Principle of IC analysis AND its 2 flaws Principal:

The principal of IC analysis is to cut a sentence into two and to continue with the smallest indivisible unit, the morphemes are reached.

Flaws: (IMP)

Firstly, it does not indicate what kind of elements those constituent parts are; it does not even identify except implication.

Secondly, it does not show clearly that noun phrases are built on nouns, verb phrases on verbs etc.

Thirdly, IC analysis does not tell us how to form new sentences, i.e. to produce sentences that have not already been attested in some corpus of data.
