BT503: Environment Biotechnology

Assignment No.2

Spring 2021

Due Date: 16th

July,2021

Audio Assignment:

Introduce yourself first and share your ideas, preferences, hopes, outcomes, and feedback about the course Environment Biotechnology BT503.

My name is_____son of/daughter of_____. I am_____years old. I belong to _____ city. I have_____ siblings. I am doing _____from virtual university by profession.

This course is designed to develop understanding of the students to the fundamental concepts of environmental biotechnology including a wide range of applications such as bioremediation, prevention, and detection and monitoring, genetic engineering for sustainable development and better quality of living organisms. This course will enable the students to get sufficient knowledge about the subject. This course is concern about by using such techniques which reduce the environmental pollution. It brings changes in the industrial level which are very effective for human health.

Environmental biotechnology deals about the issues and their solution about the environment by using different types of microbes. This branch also helps to reduce the sewage waste produced by different kinds of industrial and also working to discover different ways to dispose the sewage waste. It primarily focuses on improving biological systems. It is a cross-disciplinary where the experts focus on creating new products, analyze them and their relationships which helps in developing the environment. An environmental biotechnology is a combination of both biology and professional engineering where the students work of developing the remediate contaminated sites like microbes, bacteria, fungi, biologists of this stream undertake researches on these

organisms and breakdown them and convert them into harmless organelles which can be beneficial to the environment.

This branch of biotechnology is working with use of microbes to remove different kinds of environmental pollutants from the environment, thus having a great revolution in bioremediation. Environmental biotechnology will also be focus in the crops and they modify the genetic makeup of plants which helps them to protect the crops from any kind of weather conditions. Crops don't affect by the water pollution and environmental conditions. Environmental biotechnology will focus for the production of Biofuel which will use in all kinds of transporter vehicles that's help to keep the environment because Biofuel doesn't produce harmful gaseous.

Using biotechnological methods, so far, man has been able to produce golden rice, BT cotton, Alfalfa Rice which has Beta Carotene using for the production of Vitamin A, transgenic plants, many vaccines, antibiotics etc. Stem cell culture has enabled him to produce any organ necessary for transplantation. Gene therapy is becoming one of the methods to cure genetic disorders and diseases. I also expected, it brings change in the agriculture field.
