# ASSIGNMENT # 03
# BT503: ENVIRONMENT BIOTECHNOLOY

**Total Marks: 4**
**Due date: 17-03-2021**

**Instructions:**

## Questions

a) **Define Biosensors? (02)**

**Biosensor** is a type of instrument which is used to detect and qualifies the concentration of biological analyte or biomolecules like protein, lipid and other microorganisms. Biosensor is an instrument which is very specific in its working and it can detect very specific analyte in the sample Its main function is to covert the biochemical signal into electrical signal for the detection of the concentration of the sample.

b) **How Biosensors are more useful over conventional Analytical Techniques? (02)**

Biosensor are more useful against the conventional analytical technique, because it has ability to detect the biological and chemical substances with high sensitivity and specificity. Conventional analytic techniques are required laboratories for the detection, it can detect high accurate result with a very low limit detection and it is very expensive. These techniques required high trained staff and very time consuming. But now with the development of this analytical tool which is known as Biosensor is able to provide very fast result with high accuracy as compare to conventional analytical technique. Biosensor is very reliable and has great limit detection with less cost.
