Q.1 Explain types of observation?

Participatory observation:
* The researcher actively participates in a group or activity.
* DEEP Panda helps gain inner understanding.
* Normal in Ethnographic Research.

Non-participatory Observation
* The researcher observes a distance without communicating.
* Reduces performance on participants' behavior.
* Suitable for objective or structured observations.

Partially participatory observation
* The researcher sometimes interacts but is not fully engaged.
* The involvement and objection of the balance.
* Useful when full partnership is possible or not necessary.

Q.2 Technique for a successful interview?

1. Prepare Thoroughly
2. Build Rapport
3. Use Open-Ended Questions
4. Practice Active Listening
5. Be Flexible
6. Probe for Depth
7. Stay Neutral
8. Record and Take Notes
9. Ensure Confidentiality
10. Thank the Participant

Q.3 Approaching qualitative research?

1. Ethnography
2. Ethnomethodology
3. Phenomenology

Q.4 Robert Putnam 1995 “Theory of reciprocity”. Write 3 types?

1. Positive reciprocity
2. Negative reciprocity
3. Balance reciprocity

Q.5 Trust building in case study?

1. Establishing rapport
2. Transparency
3. Confidentiality
4. Empathy
5. Active listening
6. Consistency
7. Respect
8. Foster collaboration
9. Enhance validity
10. Reflexive
11. Cultural Sensitivity
12. Flexibility
13. Feedback

Q.6 What are ways of data collection in biographical study?

1. Oral history
2. Life history
3. Personal narrative biography
4. Oral biography
5. Documentary biography (photos/
6. videos/ audios).

Q.7 What methods are used in data collection in the grounded theory and why?

Interviews and observations are used in this method. In this method data collection and analysis is parallel and constructs and concepts are the data.

Or

Interviews and observation are used in this method, because it provides the Deep contextual, referred to insights. The analysis is parallel to the data

collection data emerging from the data. This repetitive process leads to the development of well ground concepts and theoretical structure.

Q.8 Linkage between Theory and research?

Aspects	Theory	Research
Role	Provides a framework for research	Emerges from research findings
Purpose	To test or apply existing theories	To build or generate new theories
Approach	Deductive	Inductive
Common method	Surveys, experiments	Interviews,observations (Grounded Theory)
Direction of process	Starts with theory	Starts with data
Nature of relationship	Theory informs research	Research informs theory

Q.9 Why is peer review important for reliability and validity of research and its impacts?

Peer review is vital for field work planning, providing conceptual clarity, exposure, cultural understanding, theoretical clarity, and identifying strategy gaps, while also fostering mutual learning and identifying potential issues.

Q.10 How to make research reader friendly?

1. Use clear, simple language and avoid jargon.
2. Arrange the material with clear title and logical flow.

3. Include scenes like charts and tables to explain data.
4. Write a brief, attractive essence.
5. Highlight the major points with a bullet list or bold text.
6. Explain why research matters with real -life examples.
7. Keep it brief and certified.

Q.11 Why is it important to document your research ?

Document research is important for ensuring accuracy, enabling verification, tracking progress, supporting reliability and sharing knowledge.

Q.12 Literature review and data safety?

Literature review is an integral part of any good research. It enhances the personal knowledge of researcher. Further it also tells us what is already known. Review is also important to identify the gap between existing body of knowledge and new knowledge. Through this, researchers not only learn from others but also add value in research.

Data safety;

Ensuring that participant data is protected using password, encryption, and confidentiality practice and collecting data literature and your own material should be safe in three places: In clouds computer, Dropbox and Google drive.

Q.13 Phenomenology as a qualitative approach?

Phenomenology, a western approach, views people as real data. Qualitative research approaches vary, with merits and demerits. Researchers can combine these approaches or choose their own, depending on the topic, community, and researcher's purpose.

Q.14 Steps in Qualitative Research?

1. Acknowledge social self
2. Adopt perspective
3. Design study
4. Collect data
5. Analyze data
6. Interpret data

7. Inform others

Q.15 Difference between Qualitative research and Quantitative research?

Aspects	Quantitative	Qualitative
Purpose	Test hypothesis	Discover ideas, exploratory research
Approach	Measure and Test	Observe and interpret
Data collection approach	Numerical / structure	Non-numerical / unstructured
Sample size	Large sample	Small sample
Most often used	Descriptive and casual	Exploratory research

Q.16 Historical comparative?
In this design history is compared with present. For example, marriage eremonies in previous century and in this century.

Q. 17 Types of Non-Probability sample?
1. Self- selection sampling
2. Snowball sampling
3. Quota sampling
4. purposive sampling
