Instances of secondary prevention for other health problems can be found in many different settings: examination of the mouth and jaw regions for early cancer detection during dental visits, free blood pressure measurements at shopping malls, and assessments of children's vision and hearing at school, to cite a few.

Many physicians and adult patients practice secondary prevention through complete physical examinations each year. These checkups are costly in time and money—they consist of a medical history, examination of the body, assessment of vital signs (blood pressure, heart rate, etc.), and a variety of X-ray and laboratory tests. Because not all of these tests have proven useful in preventing illness, medical experts now recommend getting specific tests, each with recommended schedules ranging from 1 to 5 years, depending on the person's age.

For instance, the American Cancer Society recommends that women should have mammograms (breast X ray) annually after the age of 40, but less frequently at younger ages. All adults over the age of 50 should have a **sigmoidoscopy** (colon inspection) every 5 years or so. Individuals who are not healthy or are considered to be at high risk—for example, because of past illnesses, family history, or hazardous work conditions—should be examined more often.

These medical examinations are recommended because they detect the disease earlier and save lives. In the

PSYCHOSOCIAL INTERVENTIONS FOR PEOPLE WITH CHRONIC CONDITIONS

Before people actually experience specific chronic illnesses in their families, they usually have some ideas about how serious the health problems are. How do they feel about an illness after someone in the family develops it? Is it worse than they expected, or not as bad, or about the same? The answers to these questions should have a bearing on how well the family adjusts to health problems. One study had parents whose children had either diabetes, asthma, epilepsy, or no chronic illness rate how serious each of the three health problems would be if their children were to develop it or had it now.

The ratings reveal two interesting findings: (1) the lowest ratings of seriousness the parents gave were for the health problems their own children had and (2) parents whose children did not have chronic illnesses rated each of the health problems as being very serious. These findings indicate that parents who live with chronic illnesses in their children tend to have less negative views of the health problems than parents whose children do not have those illnesses. People are frightened by the prospects of health problems, but most families adjust fairly well if a child develops a chronic illness.

As we have seen, not all people adjust well to chronic health conditions. The types of adjustment problems that commonly develop with chronic conditions are outlined here.

Types of Adjustment Problems in Chronic Illness

- **Physical**—being unable to cope with disability or pain.
- **Vocational**—having difficulty revising educational and career plans or finding a new job.
- **Self-concept**—being unable to accept one's changed body image, sell-esteem, and level of achievement or competence.
- **Social**—having difficulty with losing enjoyable activities or finding new ones and coping with changed relationships as family, friends, and sexual partners.
- **Emotional** – experiencing high levels of denial, anxiety, or depression.
- **Compliance**—failing to adhere to the rehabilitation regimen.

The problems patients and their families experience depend on many factors, such as how visible, painful, disabling, or life threatening the illness is.

Another factor is the patient's **age**. In the early childhood years, victims of chronic illness may become excessively dependent if the parents are over-protective, such as by not allowing an epileptic child to play in a wading pool with careful supervision. In later childhood and adolescence, chronically ill individuals may experience school failure because of absences and peer criticism or rejection because of the illness. These, events can impair the development of friendships, self-confidence, and self-esteem. Adults who develop a chronic condition may have difficulties if their illness leads them to stop working or change jobs, alter their parenting role, or change or stop their sexual relations.

145

Ideally, intervention programs to help individuals with chronic health problems involve interdisciplinary teams of professionals—physicians, nurses, psychologists, physical and occupational therapists, vocational counselors, social workers, and recreational therapists—working in an integrated manner toward the overall goals of rehabilitation.

Alcohol

Having more than two drinks each day for many years may increase the chance of developing cancers of the mouth, throat, esophagus, larynx, liver, and breast. The risk increases with the amount of alcohol that a person drinks. For most of these cancers, the risk is higher for a drinker who uses tobacco.

Poor Diet, Lack of Physical Activity, or Being Overweight

People who have a poor diet, do not have enough physical activity, or are overweight may be at increased risk of several types of cancer. For example, studies suggest that people whose diet is high in fat have an increased risk of cancers of the colon, uterus, and prostate. Lack of physical activity and being overweight are risk factors for cancers of the breast, colon, esophagus, kidney, and uterus.

Scanned with CamScanner

in which high levels of fatty acids in the blood lead to kidney malfunction thereby causing wastes to accumulate and poison the body. The symptoms of ketoacidosis generally begin with chronic thirst and urination, followed by an acute episode of nausea, vomiting, abdominal pain, and labored breathing. About one-third of type 1 cases are diagnosed after these symptoms appear. If left untreated, Ketoacidosis can lead to coma and death in a matter of days or weeks.

Type 2 diabetes (sometimes called non-insulin dependent diabetes mellitus) is very prevalent, accounting for the vast majority of diabetes cases. In this form of diabetes, the pancreas produces at least some insulin, and treatment often does not require insulin injections. Most, but not all, people with type 2 diabetes can manage their glucose levels by carefully following special diets and taking medication. Although type2 diabetes can develop at any age, it usually appears after the age of 40. Most type 2 patients are very overweight, and many produce substantial amounts of insulin—sometimes more than normal—but their bodies seem to resist the glucose-controlling action of insulin. Normal- weight type 2 patients seem to produce reduced levels of insulin. In either case, hyperglycemia results.

What causes the pancreas to reduce its production of insulin?

Although the causes are not well understood, twin studies have demonstrated that genetic factors are involved in both type 1 and type 2 diabetes. Most diabetics probably inherit some form of susceptibility to the effects of environmental conditions that could affect insulin production. In type 1, one environmental condition seems to involve a viral infection that stimulates the immune system to attack pancreas cells.

Scanned with CamScanner

health reports they encounter. Another reason may be that they just don't want to ch issue.

Another approach

Other approaches the mass media have used focus on people who already want to habit. For example, programs conducted on TV have been effective in getting smo steps in quitting by offering free printed materials or kits with hints on how to stop anc community agency. A more comprehensive program on TV, called Cable Quit, was people stop smoking by showing them how to prepare to quit, helping them throu describing ways to maintain their success, and giving them opportunities to call for a started the program, 17% continued to abstain from smoking a year later.

Another source of information is comp

Another source of health promotion information is the computer, particularly via anywhere in the world who are already interested in promoting their health and have can contact a wide variety of websites. Some are huge databases with information on promotion, and others provide detailed information on specific illnesses, such as ca support groups for health problems. People can learn how to avoid health problems a what the illness is and how it can be treated.

A third source of health promotion information is medical settings, particularly physici advantages and disadvantages in using medical settings as sources of health informat are that many individuals visit a physician at least once a year; and they respect he experts. Two disadvantages are that these efforts take up time in already busy p personnel may not know how to help people overcome problems they have in recommendations. Because of the problem of time in busy practices, researchers hav minute counseling programs that medical staff can be trained to give in person or on th

Medical professionals now have another avenue for providing health promotion in offer individuals who are at risk for inherited illnesses, such as some forms of canc chances of getting the disease and opportunities to undergo tests, such as periodic exa testing. But even when genetic testing is offered at no cost, more than half of individu testing and results.

Maintaining Healthy Behaviors

When people adopt a new behavior in place of one they performed for a lo some setbacks, or lapses. A **Lapse** is an instance of backsliding—for insta might have a cigarette one day. Lapses should be expected; they do no setback is a **relapse**, or falling back to ones original pattern of the undesirable behavi common when people try to change long-standing habits, such as their eating and smol

Psychologists C. Alan Marlatt and Judith Gordon have proposed that for many in behavior, such as smoking, experiencing a lapse can destroy their confidence in rem precipitate a full relapse. This is called the **abstinence-violation** Becau committed to total abstinence, they tend to feel guilty about any lapse just their violation as a sign of a personal failure. They might think, for n't all and I cannot change." In programs to change behavior, relapses c by t cope with lapses and maintain self-efficacy about the behavior and iding contacts. Contacts, even by phone, can reduce relapses substantially by providing c with difficult situations that could lead to lapses.
