Q48

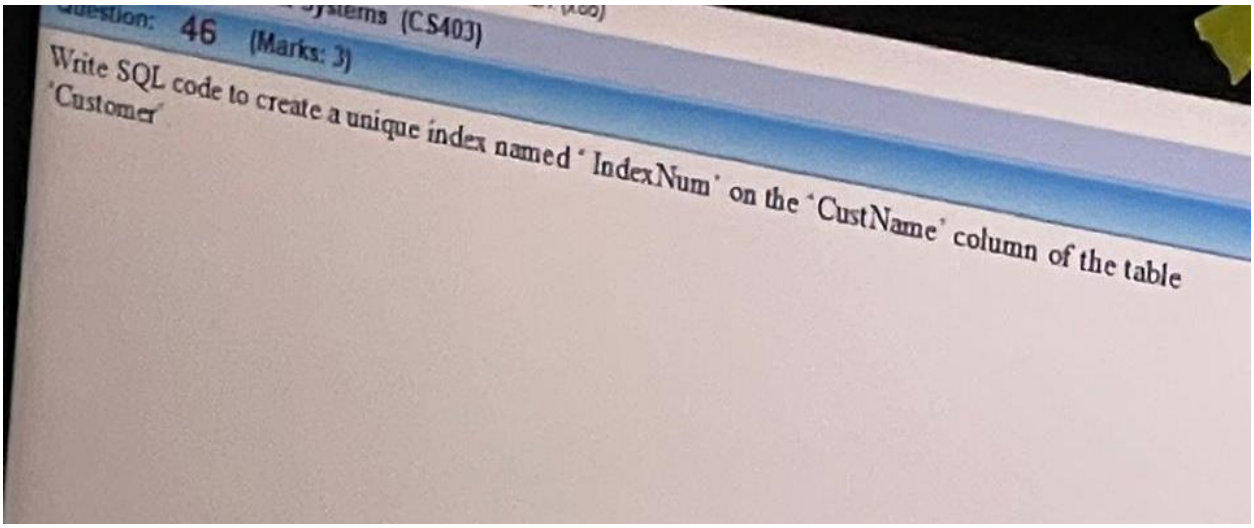

A

Locking is maintained by the transaction manager or more precisely lock manager. Transactions apply locks on objects. During the time when an object is locked it is available for operations only to the transaction that has got the lock on that object through lock manager.

B

Locking is based on two types of locks; shared and exclusive.

CS403 FINAL TERM BY IQRA AZHAR

A memory cache, sometimes called a cache store or RAM. Cache is a portion of memory made of high-speed static RAM (SRAM) instead of the slower and cheaper DRAM used for main memory. Memory caching is effective because most programs access the same data or instructions over and over. By keeping as much of this information as possible in SRAM, the computer avoids accessing the slower DRAM. Some memory caches are built into the architecture of microprocessors.. The Intel 80486 microprocessor, for example, contains an 8K memory cache, and the Pentium has a 16K cache. Such internal caches are often called Level 1 (L1) caches. Most modern PCs also come with external cache memory, called Level 2 (L2) caches. These caches sit between the CPU and the DRAM.
