

ENG507_Glossary

1. **Advanced tongue root (ATR)** :Having the root of the tongue pulled forward so as to widen the pharynx (and, often, to raise the body of the tongue nearer to the roof of the mouth). Pharyngeal sounds are [-ATR], as the pharynx is narrowed.
2. **affricate** :A stop followed by a homorganic fricative.
3. **allophone** :A variant of a phoneme. The allophones of a phoneme form a set of sounds that (1) do not change the meaning of a word, (2) are all very similar to one another, and (3) occur in phonetic contexts different from one another—for example, syllable initial as opposed to syllable final. The differences between allophones can be stated in terms of phonological rules.
4. **alternations** :Variations in words that can be described in terms of phonological rules; for example, the difference between [aɪ] and [I] in divine, divin(ity).
5. **alveolar** :An articulation involving the tip or blade of the tongue and the alveolar ridge, as in English [d] in die.
6. **alveolar ridge** :The part of the upper surface of the mouth immediately behind the front teeth.
7. **alveolo-palatal** :Post-alveolar consonant produced with significant raising of the front of the tongue toward the palate.
8. **ambisyllabic** :Belonging to two syllables. A consonant such as [p] in happy is sometimes said to be ambisyllabic.
9. **apical** :An articulation involving the tip of the tongue.
10. **approximant** :An articulation in which one articulator is close to another but without the tract being narrowed to such an extent that a turbulent airstream is produced. In many forms of English, / j, l, r, w / are approximants.
11. **articulator** :One of several parts of the vocal tract that can be used to form speech sounds.

By ASFAND YARR

ENG507_Glossary

- 12. aspiration** :A period of voicelessness after the release of an articulation, as in English in pie [pÓaI].
- 13. assimilation** :The change of one sound into another making it more similar to a neighboring sound, as in the change of underlying [n] to [m] in input [·ImpÁt] or of underlying [z] to [Z] in does she [·dØZSi].
- 14. back vowel** :Vowel in which the body of the tongue is in the back part of the oral cavity (mouth). The vowels [u, o, O, A] form a set of back reference vowels.
- 15. bilabial** :An articulation involving both lips, as in English [m] in my.
- 16. binary feature** :A feature (for example, Lateral) that can be used to classify sounds in terms of two possibilities.
- 17. breathy voice** :Another name for murmur; a type of phonation in which the vocal folds are only slightly apart so that they vibrate while allowing a high rate of airflow through the glottis, as in Hindi [bH].
- 18. broad transcription** :A transcription that does not show a great deal of phonetic detail; often a simple phonemic transcription.
- 19. cardinal vowels** :A set of reference vowels first defined by Daniel Jones. The vowels of any language can be described by stating their relationships to the cardinal vowels.
- 20. citation form** :The form a word has when it is cited or pronounced in isolation.
- 21. click** :A stop made with an ingressive velaric airstream, such as Zulu [=].
- 22. closed syllable** :A syllable with a consonant at the end, as the first syllables in English magpie, pantry, completion.
- 23. coarticulation** :The overlapping of adjacent articulations.
- 24. coda** :The consonants occurring after the vowel in a syllable.

By ASFAND YARR

ENG507_Glossary

- 25. contour tone** :A tone in a language such as Chinese that must be specified as a gliding movement within the pitch range.
- 26. coronal** :A term for sounds articulated with the tip or blade of the tongue raised toward the teeth or the alveolar ridge (or, sometimes, the hard palate), such as [t, s, n].
- 27. creaky voice** :See laryngealization. π declination :Gradual intonational pitch fall over the course of an utterance.
- 28. dental** :Refers to sounds made with the tongue touching the teeth.
- 29. diacritic** :Small added mark that can be used to distinguish different values of a symbol. For example, the addition of [ː] distinguishes a velarized from a nonvelarized sound, as in [l ː] as opposed to [l].
- 30. diphthong** :A vowel in which there is a change in quality during a single syllable, as in English [aɪ] in high.
- 31. dorsal** :Describing a sound articulated with the back of the tongue. π dorsum :The back of the tongue.
- 32. downdrift** :The tendency for the pitch to fall throughout an intonational phrase.
- 33. ease of articulation** :A phonetic force that impacts linguistic sound systems so that patterns that are easier to produce are more likely than difficult patterns.
- 34. ejective** :A stop made with an egressive glottalic airstream, such as Hausa [k'].
- 35. epenthesis** :The insertion of one or more sounds in the middle of a word, such as the pronunciation of sense as [s'nts].

By ASFAND YARR

ENG507_Glossary

- 36. exemplar theory** :The idea that phonetic categories are represented in the mind as a set of all of the examples of the category that the speaker has produced and/or heard.
- 37. feature** :A phonetic property of a sound. Some features like Coronal are fairly general, while others like Laminal Dental are more specific.
- 38. filter** :In acoustic phonetics, a filter is an acoustic tube that enhances some frequency components of a sound source while decreasing the amplitudes of other components.
- 39. flap** :An articulation in which one articulator, usually the tongue tip, is drawn back and then allowed to strike against another articulator in returning to its rest position.
- 40. formant** :A resonating frequency of the air in the vocal tract. Vowels are characterized by three formants.
- 41. frequency** :The rate of oscillation in air pressure in a periodic sound wave.
- 42. fricative** :Narrowing of the distance between two articulators so that the airstream is partially obstructed and a turbulent airflow is produced, as in English [z] in zoo.
- 43. front vowel** :Vowel in which the body of the tongue is in the front part of the oral cavity (mouth). The vowels [i, e, ɛ, a] form a set of front reference vowels.
- 44. geminate** :Adjacent segments that are the same, such as the two consonants in the middle of Italian folla [·folla] ‘crowd’.
- 45. gesture** :Abstract representation of the motor control plans for linguistically significant vocal tract actions. See also coordinative structure.
- 46. glottal** :An articulation involving the glottis, as [ʔ] in many forms of English button [·bʊtənʔ].

By ASFAND YARR

ENG507_Glossary

- 47. glottal stop** :glottal “catch” A stop sound produced by pressing the vocal folds tightly together.
- 48. glottalic airstream mechanism** :Movement of pharynx air by the action of the glottis. Ejectives and implosives are produced with a glottalic airstream mechanism.
- 49. glottis** :The space between the vocal folds.
- 50. hard palate** :The bony structure that forms the roof of the front part of the mouth.
- 51. homorganic** :Made with the same place of articulation. The sounds [d] and [n], as in English hand, are homorganic.
- 52. implosive** :A stop made with an ingressive glottalic airstream, such as Sindhi [ʈ].
- 53. impressionistic transcription** :transcription in which the symbols indicate only the general phonetic value of the sounds.
- 54. intensity** :The amount of acoustic energy in a sound.
- 55. interdental** :Articulated with the tongue between the upper and lower teeth. Many speakers of American English use an interdental articulation in words such as thick, thin.
- 56. intonation** :The pattern of pitch changes that occur during a phrase, which may be a complete sentence.
- 57. intonational phrase** :The part of an utterance over which a particular intonation pattern extends. There may be one or more tone groups in an English sentence.
- 58. labial** :An articulation involving one or both lips, such as [f, v, m].

By ASFAND YARR

ENG507_Glossary

- 59. labial velar (labiovelar)** :An articulation involving simultaneous action of the back of the tongue forming a velar closure and the lips forming a bilabial closure.
- 60. labialization** :A secondary articulation in which lip rounding is added to a sound, as in English [S].
- 61. labiodental** :An articulation involving the lower lip and the upper front teeth.
- laminal** :An articulation made with the blade of the tongue.
- 62. laryngeal** :The region of the vocal tract at the glottis in which consonantal articulations such as [h, /] are made.
- 63. laryngealization** :Another name for creaky voice; a type of phonation in which the arytenoid cartilages hold the posterior end of the vocal folds together so that they can vibrate only at the other end, as in Hausa [b0].
- 64. lateral** :An articulation in which the airstream flows over the sides of the tongue, as in English [l] in leaf.
- 65. lax** :A term with no specific phonetic correlates, used when dividing vowels into classes on phonological grounds. In English, the lax vowels are those that can occur in monosyllables closed by [N], such as sing, length, hang, long, hung.
- 66. length** :The linguistic use of physical duration to distinguish words. See geminate.
- 67. linguo-labial** :Articulated with the tongue near or contacting the upper lip.
- 68. lip rounding** :The action of bringing the corners of the lips toward one another so that the mouth opening is reduced.
- 69. liquid** :A cover term for laterals and various forms of r-sounds.
- 70. locus** :The apparent point of origin of the formants for each place of articulation.

By ASFAND YARR

ENG507_Glossary

- 71. loudness** :The auditory property of a sound that enables a listener to place it on a scale going from soft to loud without considering the acoustic properties, such as the intensity of the sound.
- 72. monophthong** :A vowel in which there is no appreciable change in quality during a syllable, as in English [A] in father. Compare diphthong.
- 73. murmur** :Another name for breathy voice; a type of phonation in which the vocal folds are only slightly apart so that they vibrate while allowing a high rate of airflow through the glottis, as in Hindi [bH].
- 74. narrow transcription** :A transcription that shows phonetic details (such as, in English, aspiration, length, etc.) by using a wide variety of symbols and, in many cases, diacritics. ϖ nasal :A sound in which the soft palate is lowered so that there is no velic closure and air may go out through the nose, as in English [m] in my.
- 75. nasal plosion** :The release of a plosive by lowering the soft palate so that air escapes through the nose, as at the end of the word hidden.
- 76. nasal stop** :A complete stoppage of the oral cavity so that the airstream passes only through the nose. Usually, nasal stops are simply called nasals.
- 77. nasal vowel** :A vowel in which part of the airstream passes out through the nose.
- 78. nasalization** :Lowering of the soft palate during a sound in which air is going out through the mouth, as in the vowel [oe)] between nasals in English man.
- 79. nucleus** :The center of a syllable, usually just the vowel.
- 80. obstruent** :A fricative, stop, or affricate. onset A consonant that occurs before the vowel in a syllable.
- 81. onset** :A consonant that occurs before the vowel in a syllable.

By ASFAND YARR

ENG507_Glossary

- 82. open syllable** :A syllable without a consonant at the end, as the first syllables in English beehive, bylaw, sawing.
- 83. oral stop** :Complete stoppage of both the oral and nasal cavities, as in [b, d, g].
- 84. palatal** :An articulation involving the front of the tongue and the hard palate, as in English [j] in you.
- 85. palatalization** :A secondary articulation in which the front of the tongue is raised toward the hard palate, as in the so-called soft sounds in Russian.
- 86. palato-alveolar** :An articulation between the tongue blade and the back of the alveolar ridge.
- 87. perseverative coarticulation** :The persistence of an aspect of the articulation of one sound into the following sound, for example, the laryngealization of a vowel after a glottal stop.
- 88. pharyngeal** :An articulation involving the root of the tongue and the back wall of the pharynx, as in the Arabic [ʕ].
- 89. pharyngealization** :A secondary articulation in which the root of the tongue is drawn back so that the pharynx is narrowed, as in some so-called emphatic consonants in Arabic.
- 90. phonation** :Vibration of the vocal folds in voicing.
- 91. phoneme** :The smallest distinctive unit in the structure of a given language. See also allophone.
- 92. phonetic implementation** :Accounting for phonetic variability by writing rules that show the relationship between abstract phonological representations and cross linguistic, dialectal, or individual variants.

By ASFAND YARR

ENG507_Glossary

- 93. phonology** :The description of the systems and patterns of sounds that occur in a language.
- 94. pitch** :The auditory property of a sound corresponding to a musical note that enables a listener to place it on a scale going from low to high.
- 95. plosive** :A stop made with a pulmonic airstream mechanism, such as in English [p] or [b].
- 96. post-alveolar** :A sound produced with constriction between the alveolar ridge and the palate.
- 97. prominence** :The extent to which a sound stands out from others because of some combination of its sonority, length, stress, and pitch.
- 98. pulmonic airstream mechanism** :The movement of lung air by the respiratory muscles. Most sounds are produced with a pulmonic airstream mechanism.
- 99. r-colored** :Vowels that are essentially some form of a syllabic rhotic approximant [' ʁ].
- 100. radical** :An articulation made with the root of the tongue. **reduced** :A reduced form of a word is a production that exhibits significant deviation from a citation production, including reduced vowels and deleted segments.
- 101. reduced vowel** :A vowel that is pronounced with a noncontrasting centralized quality, although in the underlying form of a word it is part of a full set of contrasts. The second vowel in emphasis is a reduced form of the vowel / oe /, as in emphatic.
- 102. release burst** :A burst of noise produced when a stop consonant is released.

By ASFAND YARR

ENG507_Glossary

- 103. retroflex** :An articulation involving the tip of the tongue and the back part of the alveolar ridge. Some speakers of English have retroflex approximants in rye and err. Retroflex stops occur in Hindi and other languages spoken in India.
- 104. rhotacization** :The auditory property known as r-coloring that results from the lowering of the third formant.
- 105. rhotic** :A form of English in which / r / can occur after a vowel and within a syllable in words such as car, bird, early. Most forms of Midwestern American English are rhotic, whereas most forms of English spoken in the southern part of England are nonrhotic.
- 106. rhyme** :The vowel (nucleus) and any consonants occurring after the vowel in a syllable.
