

1. Atmosphere contains **21%** of oxygen.
 2. Energy in the form of **food** is transferred from one organism to other through different trophic levels.
 3. Aquatic marine Herbivorous Eat **150** pounds of plants each day.
 4. **photosynthesis** is a process that starts an ecological food web.
 5. **All given** Provide stability to ecosystem.
 6. Tertiary consumers eat the carnivores that ate the **herbivores**.
 7. **Decomposers** They release nutrients from the dead bodies of plants and animals and return them to the soil, water, and air for reuse by producers.
 8. In **open water**, the dominant producers are phytoplankton.
 9. **Demography** Study of human population and the factors that regulate the growth of population.
 10. Humans belongs to **omnivores** class of organisms.
 11. Catfish is a **detritivores**.
 12. Nitrifying bacteria (Nitosomonas and Nitrobacter) are **chemosynthetic** in nature.
 13. Grasshoppers belong **Herbivores** of class of organisms.
 14. An ecological pyramid is further classified into **three** main type.
 15. A **food pyramid** is a graphical representation of flow of energy through different trophic levels of an ecosystem.
 16. A certain range of values within the tolerance range is called the range of **optimum**.
 17. Secondary consumers are also known as **Meat eaters**.
 18. Animal populations change over time as a result of **all given**.
 19. On land, most producers are green plants, which generally capture about **1%** of the solar energy.
 20. The **habitat** which is the actual place of living of an organisms.
