Psy512 Short Question

Psy512 Short Question for Mid Term All Lesson and Topic Wise Complied By A.N.Khuram Whatsapp 03401218603 Free of Cost Remind me in Your Prayers

Lesson No.1

Common misconception: Is gender psychology only focused on the psychology of women?

Answer: No, gender psychology encompasses both the psychology of women and the broader psychology of gender, including understanding masculine and feminine roles beyond women's experiences.

Focus of the course: What factors contribute to distinct masculine and feminine roles?

Answer: Factors contributing to distinct masculine and feminine roles can include biological, social, cultural, and psychological influences, supported by extensive research evidence.

Who shapes our behavior as males or females?

Answer: While humans are born male or female, their development into masculine or feminine behaviors is shaped by child-rearing practices and sociocultural variables.

What is the difference between 'gender' and 'sex'?

Answer: 'Gender' refers to psychological perceptions of being male or female, while 'sex' refers to physiological or physical distinctions.

Lesson No.2

What is feminism?

Compiled by A.N.Khuram

Answer: Feminism is a movement or way of thinking that advocates for social equality between the sexes and challenges traditional gender roles and inequalities.

What distinguishes 'gender perspective' from 'sexist perspective'?

Answer: A gender perspective focuses on understanding differences between men and women as learned and attained, whereas a sexist perspective perpetuates stereotypes and discrimination based on biological sex.

What are the goals of the feminist movement?

Answer: The goals of feminism include advocating for change, promoting equal rights and opportunities, eliminating gender stratification, curbing violence against women, and supporting sexual autonomy.

What are the forms or varieties of feminism?

Answer: Forms of feminism include liberal feminism (1960s-1970s) advocating for equal rights, radical feminism challenging cultural gender notions, socialist feminism emphasizing collective liberation, and cultural feminism promoting appreciation of traditionally feminine values.

Who are some notable figures in the history of feminism?

Answer: Christine de Pizan, Mary Wollstonecraft, Emmeline Pankhurst, Emma Goldman, Elizabeth Cady Stanton, and Margaret Sanger are among the notable figures who contributed to the feminist movement.

What are the waves of the feminist movement?

Answer: The feminist movement is categorized into three waves: First wave feminists initiated the movement; second wave feminists focused on legal and social equality; and third wave feminists (1990s) addressed diversity within women's experiences and perspectives.

Lesson No.3

What are the two main viewpoints in psychology regarding gender differences?

Answer: The two main viewpoints are:

Compiled by A.N.Khuram

1. Biological approach: This perspective suggests that gender differences are primarily influenced by biological and evolutionary factors, making them fixed and unalterable.
2. Biosocial approach: This perspective takes a broader view, integrating knowledge from sociology, anthropology, biology, and other disciplines, emphasizing the role of society and environment in shaping gender roles.
   What is the nature versus nurture debate in psychology?

Answer: The nature versus nurture debate questions whether gender roles and behaviors are predetermined by biological factors (nature) or shaped by societal influences and learning (nurture).

Describe the minimalist and maximalist views in psychology.

Answer: Minimalists believe in fewer fundamental differences between men and women, while maximalists assert significant, inherent differences. Maximalists often adopt an essentialist perspective, emphasizing fundamental distinctions between genders.

What were the earlier schools of thought in psychology regarding gender differences?

Answer:

1. **Structuralism:** Focused on the structure of the human mind but ignored individual differences, leading to a biased understanding based on male subjects.
2. **Functionalism:** Shifted focus to mental functions and included a wider variety of subjects, challenging the biased views of structuralism.
3. **Behaviorism:** Emphasized observable behavior and neglected sex differences and gender roles.
4. **Psychoanalytic Psychology:** Introduced by Sigmund Freud, discussed sex differences in terms of psychosexual development and personality formation.

What was the impact of early psychological studies on gender differences?

Compiled by A.N.Khuram

Answer: Early studies often reflected biased views, suggesting that women were less intelligent, less successful, and intellectually deficient. Female psychologists like Helen Thompson Woolley and Letta Stetter Hollingworth criticized these biased perspectives and emphasized the role of societal factors in shaping gender roles and potential.

Lesson No.4

What are some threats to gender-related research identified by Margrit Eichler?

Answer: Margrit Eichler identified several threats to gender-related research, including: a. Androcentricity: Research often approaches issues from a male perspective, ignoring the experiences and viewpoints of women. b. Overgeneralizing: Drawing conclusions from data collected from one gender and applying them universally to both genders. c. Gender blindness: Ignoring the existence and impact of gender differences in various spheres of life. d. Double standards: Researchers' personal biases leading to assumptions and stereotypes about gender roles. e. Interference: External factors such as the researcher's gender influencing the research process and outcomes.

What is the scientific methodology used in gender research?

Answer: The scientific methodology used in gender research involves a systematic approach to problem-solving, including steps like identifying a research problem, reviewing related literature, formulating hypotheses, designing and conducting studies, analyzing data, and drawing conclusions based on empirical evidence.

What are the different research methods used in feminist/gender research?

Answer: Feminist/gender research employs both quantitative and qualitative research methods, including:

- Quantitative methods: Surveys, experimental studies, correlation studies, ex post facto studies.
- Qualitative methods: Case studies, content analysis, ethnography, interviews, focus groups.

Describe the purpose and limitations of surveys in gender research.

Compiled by A.N.Khuram

Answer: Surveys are used to gather quick information from a large number of people about opinions, attitudes, preferences, and values related to gender issues. However, surveys have limitations such as not allowing for in-depth study, relying on self-reports, and depending on respondents' memory and interpretation of questions.

Explain the concept of correlation in gender research.

Answer: Correlation in gender research refers to identifying predictive relationships between naturally occurring variables. This statistical concept helps researchers understand how two different measures of individuals, objects, or events vary together. However, correlation does not imply causation, meaning that a relationship between variables does not prove that one causes the other.

Lesson No.5

What is content analysis, and what are its primary applications in gender research?

Answer: Content analysis is a research method used to systematically categorize and analyze the content of various media and sources, such as electronic media, literature, art, textbooks, and discussions. In gender research, content analysis is often employed to assess how gender roles, stereotypes, and representations are portrayed in different forms of media and communication.

Describe unobtrusive measures and provide examples of how they are used in gender research.

Answer: Unobtrusive measures are indirect methods of data collection that do not require the presence or active participation of the subjects being studied. Examples include studying physical traces like artifacts and remains (e.g., jewelry, clothing) to understand lifestyles, behaviors, and habits, or analyzing product usage traces (e.g., examining cosmetic products discarded in garbage) to infer preferences and behaviors related to gender.

Explain archival research and its role in gender-related studies.

Answer: Archival research involves using existing records, documents, literature, photographs, and other forms of historical data as sources of evidence or information in research. In gender-related studies, archival research can be

Compiled by A.N.Khuram

valuable for studying historical trends, societal changes, and representations of gender in different contexts over time.

What is experimental research, and why is it significant in psychology?

Answer: Experimental research is a scientific method that involves manipulating an independent variable to study its effect on a dependent variable, allowing researchers to establish cause-and-effect relationships. In psychology, experimental research is significant because it helps establish scientific validity by controlling variables and testing hypotheses rigorously.

Discuss the advantages and disadvantages of experimental research in the context of studying gender issues.

Answer: Advantages:

- Provides control over variables, enhancing the scientific rigor of the study.
- Allows for establishing cause-and-effect relationships between variables.

Disadvantages:

- May lead to artificial behavior among participants.
- Subjects may experience stress or pressure.
- Expensive in terms of time and resources.
- Ethical concerns related to informed consent and deception.

What is ex post facto research, and how does it differ from experimental research?

Answer: Ex post facto research, a form of quasi-experimentation, studies naturally occurring independent variables and their impact on dependent variables. Unlike experimental research, ex post facto studies do not involve manipulating variables; instead, researchers study existing conditions or variables as they naturally occur.

Lesson no.6

What is qualitative research, and how does it differ from quantitative research?

Compiled by A.N.Khuram

Answer: Qualitative research focuses on obtaining detailed, narrative-based information rather than numerical data. This method is commonly used in disciplines like Sociology and Anthropology. Qualitative methods include in-depth case studies, interviews, and observational studies, aiming to provide rich insights into behaviors, attitudes, and experiences.

Describe the concept of case studies in research and when they are used.

Answer: Case studies involve the in-depth investigation of a single case or a small sample. This approach is used for rare conditions or situations where obtaining a large sample is impractical. Case studies are suitable for studying unique phenomena, unusual cases, or situations that can provide valuable insights due to their rarity.

Explain the purpose of interviews in qualitative research.

Answer: Interviews are a vital component of qualitative research, allowing researchers to gather in-depth information directly from participants. Interviews provide opportunities to observe non-verbal cues and body language, offering a deeper understanding of the subject matter. Interviews can be used to gather oral histories, investigate specific issues, or supplement case studies.

What is ethnography, and how is it used in psychological research, particularly in gender studies?

Answer: Ethnography involves immersing researchers into the environment or setting being studied, such as a hospital, school, or shelter home, to understand behaviors and context firsthand. It is a naturalistic observation method where researchers become part of the situation. Ethnography helps psychologists gain real-life insights into gender-related behaviors and dynamics within specific cultural contexts.

Describe focus groups and their role in qualitative research.

Answer: Focus groups involve collective interviews conducted with a small group of participants, typically 6-8 individuals. These discussions revolve around specific issues to gather opinions, attitudes, preferences, or reasons behind behaviors. Focus groups facilitate participant interaction, providing a rich source of qualitative data on gender-related topics like career choices, societal perceptions, or gender roles.

Compiled by A.N.Khuram

Lesson No.7

What are the biological differences between males and females, and how are they manifested?

Answer: Biological differences between males and females are primarily found in chromosomes, hormones, and the structure of the nervous system. Chromosomes determine sex, with females having XX and males having XY. Hormones, such as testosterone and estrogen, play a role in physical development and behavior, and the structure of the nervous system can differ between the sexes.

Describe Turner's syndrome and its impact on females.

Answer: Turner's syndrome occurs when an individual inherits only one X chromosome (XO) instead of the usual XX in females. This syndrome is characterized by short stature, distinctive physical features (webbed neck, small jaws), and reproductive issues like abnormal ovarian development leading to infertility. Treatment with growth hormones and estrogen replacement therapy can mitigate some symptoms.

Explain Klinefelter syndrome and its effects on males.

Answer: Klinefelter syndrome results from inheriting an extra X chromosome (XXY). Males with Klinefelter syndrome may exhibit physical traits like feminine body contours, enlarged breasts, and smaller testes. They are often infertile and may experience learning difficulties. Testosterone replacement therapy can help mitigate some symptoms.

What is the impact of XYY syndrome on individuals?

Compiled by A.N.Khuram

Answer: XYY syndrome is characterized by individuals having an extra Y chromosome (XYY). Typically, these individuals are taller than average, and during adolescence, they may experience acne and coordination issues. Contrary to earlier misconceptions, most individuals with XYY syndrome lead ordinary lives, though there may be a slight predisposition to certain behaviors due to higher testosterone levels.

How do hormones influence sexual differentiation during prenatal development?

Answer: During prenatal development, hormones like testosterone and estrogen play a crucial role in sexual differentiation. Testosterone, produced in males due to the Y chromosome, leads to the development of male reproductive organs (Wolffian system) and the regression of female reproductive organs (Müllerian system). In females, estrogen from X chromosomes promotes the development of female reproductive organs (Müllerian system).

What is the role of the endocrine system in sexual development and behavior?

Answer: The endocrine system, composed of glands that produce and secrete hormones, regulates sexual development and behavior. Hormones like testosterone and estrogen influence physical development, secondary sexual characteristics, and behaviors associated with gender differences.

Explain the hormonal cycle and its impact on reproductive functions.

Answer: The hormonal cycle involves the hypothalamus releasing hormones that stimulate the pituitary gland to release gonadotropins, which in turn stimulate the ovaries or testes to produce gonadal hormones (e.g., testosterone, estrogen).

Compiled by A.N. Khuram

These hormones are crucial for reproductive functions, including menstrual cycles in females and sperm production in males.

Lesson No.8

What is Adrenogenital Syndrome, and how does it affect fetal development?

Answer: Adrenogenital Syndrome results from excessive prenatal production of androgens from the adrenal glands. In male fetuses, this does not typically cause major issues. However, in female fetuses, it can result in the birth of a female with physical structures resembling those of boys. Increased androgen levels can also influence behavior, with affected girls sometimes exhibiting more "tomboy" behaviors.

Describe Androgen Insensitivity Syndrome and its impact on individuals.

Answer: Androgen Insensitivity Syndrome occurs in normal XY male fetuses where body cells are insensitive to androgens due to abnormal functioning of androgen receptors. Despite having XY chromosomes, affected individuals do not develop typical male characteristics due to the insensitivity of their cells to androgens. They may have internal male reproductive organs but appear female externally at birth. Individuals with this syndrome often identify and behave as females due to the lack of response to androgens.

What are some differences in the nervous system between men and women?

Answer: Men and women differ not only in physical attributes and reproductive functions but also in brain characteristics and problem-solving approaches. Prenatal exposure to androgens, like testosterone, plays a significant role in brain organization. Men typically have larger brain sizes than women, and specific brain regions, like the hypothalamus, show size differences under hormonal control. Men often demonstrate stronger logical, abstract, and analytical thinking associated with left-brain functions, while women tend to excel in imaginative, artistic, intuitive, and memory-based tasks attributed to right-brain functions.

Explain the biological perspective on gender differences in behavior.

Answer: The biological approach emphasizes biological processes and genetic factors that cause physical differences between men and women. Males and

Compiled by A.N.Khuram

females have distinct chromosomal makeups (XX for females and XY for males), which influence the production of hormones like testosterone and estrogen. These hormones play a critical role in prenatal physical development and are associated with behavioral differences between boys and girls. The presence or absence of specific hormones during prenatal development determines the expression of male or female characteristics.

Lesson No.9

What is gender development, and how is it defined?

Answer: Gender development refers to the process by which individuals identify themselves as male or female. It encompasses the formation of gender identity and the adoption of gender roles, which are societal expectations regarding behavior and thinking patterns based on gender.

Explain the concepts of nature and nurture in relation to gender development.

Answer: Nature refers to hereditary influences, such as genetic predispositions, that contribute to gender development. Nurture refers to environmental influences, including upbringing, culture, and socialization, that also shape gender identity and roles. Both nature and nurture interact to influence an individual's development.

Describe the Biological Approach to explaining gender differences.

Answer: The Biological Approach emphasizes that gender differences arise from biological processes, including genetics and hormones. For example, the presence of XX or XY chromosomes in females and males, respectively, influences hormonal profiles (estrogen/testosterone), which in turn impact behavior and characteristics associated with gender.

What are some key biological factors influencing gender differences according to the Biological Approach?

Answer: Biological factors influencing gender differences include sex chromosomes (XX for females, XY for males) and hormones like testosterone and estrogen. These factors contribute to physical and behavioral differences observed between males and females, such as aggression levels and susceptibility to certain health issues.

Compiled by A.N.Khuram

How do hormones influence behavioral differences between males and females according to the Biological Approach?

Answer: Androgen hormones (like testosterone) are linked to disruptive and aggressive behaviors typically observed more in males. The presence or absence of these hormones during prenatal development can affect the development of gender-specific characteristics and behaviors.

What did Money and Ehrhardt's (1972) study reveal about the impact of prenatal androgens on behavior?

Answer: Money and Ehrhardt's study found that females exposed to high levels of androgens during prenatal development tended to exhibit more physically active behaviors similar to boys. Conversely, lower levels of androgens were associated with the development of more typically female characteristics.

How does the Biological Approach explain differences in brain development between males and females?

Answer: The Biological Approach posits that biological factors influence brain development differently in males and females. Men typically exhibit more developed left-brain functions associated with logic and analytic thinking, whereas women often show more developed right-brain functions associated with creativity and intuition.

Lesson No.10

What is the basis of the Behaviorist or Learning Approach in psychology?

Answer: The Behaviorist or Learning Approach asserts that all behavior and personality traits result from learning, emphasizing the role of "nurture" over "nature." Early behaviorists like Skinner highlighted the importance of reinforcement, later expanded to include social context, observation, modeling, and imitation in what became known as the social learning approach.

How does the Behavioral Approach explain the learning of gender roles?

Answer: According to the Behavioral Approach, learning of gender roles occurs through processes such as classical conditioning, operant conditioning, and observational learning. Children acquire specific gender behaviors through

Compiled by A.N.Khuram

reinforcement, both positive (reward) and negative (avoidance of punishment), and by observing and imitating others.

Describe Operant Conditioning and its role in learning gender roles.

Answer: Operant Conditioning is a type of learning where voluntary responses are strengthened or weakened by positive or negative consequences. In the context of gender roles, this means that behaviors associated with a particular gender are reinforced (strengthened) through positive consequences like praise or approval, or negative consequences like avoiding punishment.

Explain the consequences of behavior and their impact on gender role learning.

Answer: Consequences of behavior play a crucial role in shaping gender roles. Positive reinforcement (e.g., praise for conforming to gender norms) increases the likelihood of behavior repetition, while negative reinforcement (e.g., avoiding criticism by conforming) also strengthens behaviors. Conversely, behaviors not reinforced or punished (e.g., ridicule for non-conforming behaviors) decrease in likelihood of repetition. These processes contribute to the learning and reinforcement of gender-specific behaviors.

Lesson No.11

What is the Cognitive Approach in psychology, and what does it emphasize?

Answer: The Cognitive Approach focuses on the thought processes underlying learning and behavior. It gives importance to cognition, including thoughts, feelings, values, expectations, and perception, in understanding and explaining behavior.

Explain the concept of gender schema according to the Cognitive Approach.

Answer: Gender schema is a mental framework that organizes and guides a child's understanding of information relevant to gender. It includes beliefs about gender roles, such as which toys or behaviors are considered appropriate for boys or girls.

Describe Lawrence Kohlberg's concept of Gender Constancy and its significance.

Answer: Gender Constancy refers to a child's understanding and awareness that their sex is permanent and unchanging. Kohlberg proposed that gender roles are

Compiled by A.N.Khuram

adopted after the realization of gender constancy, which typically emerges between ages 3-7. This realization is crucial for the development of gender-typed behaviors.

What are the three stages of Gender Constancy according to research by Ruble & Martin (1998; Szkrybalo & Ruble)?

Answer: The three stages of Gender Constancy are:

1. **Gender Identity:** Ages 2-3 years; Becoming aware of one's own gender and that of others.
2. **Gender Stability:** Ages 3.5-4.5 years; Realization that one's sex remains stable over time but may change in situations.
3. **Gender Consistency:** Ages 4.5-7 years; Awareness that gender remains constant regardless of appearance or behavior.

What is the Gender Schema Theory, and how does it explain the development of gender roles?

Answer: The Gender Schema Theory proposes that children develop mental frameworks (schemas) about gender based on cultural observations and experiences. These schemas guide their understanding of what it means to be male or female and influence their adoption of gender roles and behaviors.

How do preschoolers' cognitive experiences influence their understanding of gender roles?

Answer: Preschoolers tend to view gender roles in simplified, concrete terms and often rely on stereotypes. They categorize activities, objects, and behaviors based on gender and gradually develop a script describing expected gender roles in their culture.

Explain the concept of self-socialization in relation to gender development.

Answer: Self-socialization refers to children actively participating in their own gender role development. They classify themselves as male or female, recognize sex as a permanent quality, and strive to align their behavior with culturally appropriate gender roles.

Compiled by A.N.Khuram

What criticism is often directed towards the Cognitive Approach regarding gender development?

Answer: Critics argue that the Cognitive Approach overlooks the role of biological factors in shaping cognitive schemas and fails to adequately address cultural differences in the formation of gender roles.

Lesson No.12

What is the basis of the Psychodynamic Approach in psychology?

Answer: The Psychodynamic Approach is rooted in Freud's theory of psychosexual development, emphasizing the influence of family dynamics on individuals at a subconscious level, leading to the development of internal gender identities.

How does the Freudian perspective explain gender development?

Answer: According to Freud, gender roles develop as a result of resolving conflicts during psychosexual stages of development, particularly the phallic stage. In this stage, feelings of rivalry and hatred towards the same-sex parent (e.g., father) lead to the process of identification, influencing sex-typed behavior and the development of gender roles.

What are Karen Horney's contributions to the Psychodynamic Approach?

Answer: Karen Horney reexamined Freud's concepts, particularly challenging notions of female envy, feelings of inferiority, and masculinity complex. She emphasized social forces over biological influences, proposing that women's envy of men represented a desire for social prestige rather than physical attributes.

Describe Nancy Chodorow's theory of gender development from a psychodynamic perspective.

Answer: Nancy Chodorow focused on early childhood experiences with mothers, proposing that children identify with their mothers in the pre-oedipal stage. She suggested that boys face a tougher task in developing a separate gender identity from their mothers, leading to a rejection of femininity and eventual denigration of women by men in society.

What does Ellyn Kaschak's "Antigone Phase" theory contribute to understanding gender development?

Compiled by A.N.Khuram

Answer: Ellyn Kaschak drew from Sophocles' character Antigone to describe the personality development of men and women within patriarchal societies. She emphasized the impact of societal power dynamics on gender roles, suggesting that women often internalize subservient roles, leading to issues like self-denial and self-imposed limitations.

Lesson No.13

1. **What is the main concept of Roger's theory in the Humanistic Approach?**
    - **Answer:** The main concepts are ideal self and conditional positive regard.
2. **How can conditional positive regard be related to gender role development?**
    - **Answer:** Conditional positive regard sets expectations for gender roles, where individuals strive to exhibit gender-appropriate behaviors to achieve positive regard.
3. **Explain how cultural stereotypes can act as conditional positive regard in gender development.**
    - **Answer:** Cultural stereotypes impose expectations on individuals based on gender, shaping their ideal self towards gender-appropriate behaviors.
4. **Why does the Humanistic Approach not directly explain the process of gender development?**

Compiled by A.N.Khuram

- **Answer:**

The approach focuses on self-concept and personal growth rather than specific gender role development, hence lacking research data in this area.

5. **According to Maslow's Hierarchy of Needs, how do gender roles and relationships impact fulfillment of needs?**
    - **Answer:** Gender roles and relationships in society affect the fulfillment of an individual's needs, especially at higher levels like self-actualization.
6. **What does the Socio-cultural Approach propose about gender role development?**
    - **Answer:** It suggests that societal factors, cultural practices, and norms influence the development of gender roles, with children adopting gender patterns based on cultural emphasis.
7. **How do gender distinctions get engrained in children's behavior according to the Socio-cultural Approach?**
    - **Answer:** Gender distinctions are reinforced through societal practices, teaching specific skills to girls and boys based on cultural norms.
8. **What does the Epigenetic Systems Theory emphasize in understanding gender-related behaviors?**
    - **Answer:** It highlights the interaction between genetic factors and early experiences, considering biological differences as the origin of gender differences.
9. **What is the Gender Script Theory, and how does it differ from the Gender Schema Theory?**

Compiled by A.N.Khuram

- **Answer:**

- **Answer:** The Gender Script Theory organizes social knowledge about gender into sequential events, depicting gender-related behaviors as an ordered sequence appropriate to specific contexts.

10. **Why is the development of gender roles considered a positive factor in socialization and adjustment?**

    Gender roles facilitate socialization and adjustment processes, although cultural differences exist, emphasizing stereotypes like females being nurturing and males being instrumental across cultures.

Lesson No.14

1. **What is sex-typing?**
    - **Answer:** Sex-typing is the process of categorizing men and women based on certain traits, often associated with gender stereotypes.
2. **Why do social scientists prefer to use the term 'gender' over 'sex'?**
    - **Answer:** Social scientists prefer 'gender' because it encompasses socio-psychological aspects beyond biological impacts associated with 'sex'.
3. **When does development of sex-typing typically begin according to research?**
    - **Answer:** Development of sex-typing begins with sex-identity, usually acquired around the age of 3 years, but it evolves with age and experiences.
4. **How do children learn sex stereotypes during later childhood?**
    - **Answer:** Children learn sex stereotypes through imitation and observational learning, observing how others act, feel, behave, or think.

Compiled by A.N.Khan

- **Answer:**

5. **What are some examples of sex-stereotyped behaviors associated with males and females?**
    - **Answer:** Examples of sex-stereotyped behaviors for males include aggression, bravery, dominance, and independence, while females are often associated with being emotional, sentimental, fragile, dependent, and submissive.
6. **According to Freud's psychoanalytical theory, how do children develop gender roles?**

    Freud proposed that children identify with the parent of the same sex during the psychosexual stages of development, leading to the adoption of gender roles as part of socialization.
7. **What does the Social Learning Theory emphasize in gender development?**
    - **Answer:** The Social Learning Theory emphasizes that gender development is a process of observational learning, where individuals model behaviors based on rewards, punishments, and cultural influences.
8. **At what age do children typically develop a permanent cognitive category of being male or female according to Cognitive Development Theory?**
    - **Answer:** According to Cognitive Development Theory, children develop a permanent cognitive category of being male or female around the age of 4 to 6 years.
9. **What is the primary biological determinant of sex-typing?**
    - **Answer:** The primary biological determinant is the 23rd pair of chromosomes (XX in females and XY in males), influencing biological differences and leading to sex-type stereotypes.
10. **How does socialization influence sex-typing according to the discussion?**

Compiled by A.N.Khuram

- **Answer:**

- **Answer:** Socialization, driven by family, peers, schools, and cultural norms, plays a significant role in guiding children's development of gender identity and understanding of sex roles.

Lesson No.15

1. **What are gender stereotypes?**
   - **Answer:** Gender stereotypes are beliefs about the typical characteristics and behaviors of men and women, often based on cultural norms and traditions.
2. **How does holding stereotypes affect perceptions of individuals?**

   When people hold stereotypes about others, they tend to view them through the lens of pre-formed beliefs rather than as individuals.
3. **Who first used the term "stereotype" in a social sciences context?**
   - **Answer:** Walter Lippmann, a journalist, was the first to use the term "stereotype" to describe pre-formed beliefs about groups.
4. **What are some commonly held stereotypes about males and females?**
   - **Answer:** Common stereotypes include males being seen as strong, powerful, and logical, while females are often perceived as weak, emotional, and less capable.
5. **What did a 25-nation study reveal about gender stereotypes?**
   - **Answer:** The study identified a core set of descriptions consistently used to describe men (active, adventurous, logical) and women (affectionate, gentle, emotional) across cultures.

Compiled by A.N.Khuram

- **Answer:**

6. **In Western societies, what traits are preferred and associated with each gender?**
    - **Answer:** Western societies often prefer competence-related traits associated with men (independence, objectivity) over warmth and expressiveness traits associated with women.
7. **How are gender stereotypes formed according to the Psychoanalytic Approach?**
    - **Answer:** According to the Psychoanalytic Approach, gender stereotypes are formed through a child's identification with the same-sex parent.
8. **What role does socialization play in the learning of gender stereotypes?**
    - **Answer:** Socialization transmits societal beliefs and values, including gender-appropriate behaviors and perceptions of the opposite gender.
9. **How does media influence the reinforcement of gender stereotypes?**

    Media often portrays stereotypes, depicting females as less intelligent and more emotional, while males are portrayed as brave and intelligent.
10. **What does research suggest about the reality behind gender stereotypes?**
    - **Answer:** Research suggests that while some stereotypes reflect reality (e.g., men being stronger), many stereotypes are not grounded in reality (e.g., women not being wise or intelligent).

Lesson No.16

1. **What are the three developmental stages of gender stereotypes?**
    - **Answer:** The three stages are:

Compiled by A.N.Khuram

- **Answer:**

    - Stage 1 (around 3 years): Learning characteristics directly associated with males and females.
    - Stage 2 (around 6 years): Developing indirect associations for behaviors linked to gender, focused on one's own gender.
    - Stage 3 (around 8-10 years): Developing indirect associations with both own gender and the other gender, capable of making stereotypical judgments.

2. **Name and briefly explain one approach to the formation of gender stereotypes.**
    - **Answer:** Behaviorist Approach: Children learn gender stereotypes through reinforcement from parents and significant others. They are rewarded for adopting stereotypes held by parents and punished for adopting contrary beliefs.
3. **What is the Feminist or Patriarchal Approach to understanding gender stereotypes?**
    - **Answer:** This approach views gender stereotypes as a result of male dominance and female subservience in society. It suggests that stereotypes reinforce the idea that women are weaker and less capable, perpetuating their lower status.

Compiled by A N Khuram

4. **What are the implications and consequences of gender stereotyping?**
    - **Answer:** Gender stereotypes can lead to prejudices, discrimination, and faulty perceptions of gender-related behaviors. They can influence how individuals perceive, interpret, and recall genderrelated information.
5. **Define "illusory correlation" and its role in maintaining stereotypes.**
    - **Answer:** Illusory correlation is the erroneous perception of a correlation between two events when no actual correlation exists or perceiving a correlation as stronger than it is. It can lead people to see relationships between gender and behaviors where none exist, reinforcing stereotypes.
6. **Explain the concept of "Sex Role Strain" according to Pleck's model.**
    - **Answer:** Sex Role Strain (or Gender Role Strain) describes the tension experienced by individuals, particularly men, who adhere to traditional gender role expectations that are stringent and demanding. Many men find it challenging to meet these traditional norms, leading to strain associated with gender roles.

Lesson No.17

1. **What is the significance of the Israeli Kibbutzim in understanding gender roles?**
    - **Answer:** The Israeli Kibbutzim demonstrate social and gender equality where tasks and responsibilities are not differentiated by sex. Both men and women perform all types of tasks and share decision-making equally.
2. **What did Margaret Mead's study on primitive societies reveal about gender roles?**
    - **Answer:** Margaret Mead's study highlighted cultural influences on gender roles. The Arapesh were gentle and cooperative, resembling a

Compiled by A.N.Khuram

"feminine" attitude; the Mundugumor were selfish and aggressive, reflecting a more "masculine" approach; and the Tchambuli had clear gender roles with men being submissive and emotional, and women dominant and rational.

3. **How do agents of socialization like family contribute to gender-role socialization?**
    - **Answer:** Research indicates that parents interact differently with male and female children, engaging in more rough-housing play with boys. Children are also encouraged to play with different types of toys based on their sex, and household chores are assigned according to gender.
4. **What role does the educational system play in reinforcing gender roles?**
    - **Answer:** The educational system reinforces gender roles through curricula, textbooks, and teachers' attitudes. Teachers tend to reward and encourage sex-appropriate behaviors, pay more attention to male students, and depict men as more capable and professional in textbooks.
5. **How does the media portray gender stereotypes?**
    - **Answer:** The media often portrays women as attractive but less competent, while men are depicted as competent, self-reliant, and professional despite possibly being less physically attractive compared to women.

Lesson No.18

1. **What are the three aspects involved in the development of gender role identification according to Lynn (1959)?**
    - **Answer:** The three aspects involved in the development of gender role identification are Gender Role Preference, Gender Role Adoption, and Gender Role Identification.
2. **At what age does Gender Role Preference typically begin to manifest in children?**

Compiled by A.N.Khuram

- **Answer:** Gender Role Preference begins to manifest around 3 years of age and becomes firm and established by 5 years of age.

3. **What is Gender Role Adoption?**
    - **Answer:** Gender Role Adoption refers to the adoption of observable, sex-related behaviors performed by members of one's own sex.
4. **How do boys and girls differ in the development of Gender Role Adoption and Gender Role Identification?**
    - **Answer:** For girls, Gender Role Adoption and Gender Role Identification develop simultaneously, whereas for boys, Gender Role Adoption follows a sequence.
5. **What is Gender Identity, and how does it differ from Gender Roles?**
    - **Answer:** Gender Identity refers to children's identification and acceptance of themselves as male or female, which is more of an internal phenomenon. Gender Roles, on the other hand, pertain to observable behaviors typically associated with the two genders.
6. **What are the basic ingredients required for a child to develop gender identity?**
    - **Answer:** The basic ingredients for a child to develop gender identity include awareness of the existence of males and females as separate categories, understanding of the differences between males and females, knowledge of gender-related behaviors and activities, and cognitive data to fit into one category or the other.
7. **What does Gender Constancy refer to?**
    - **Answer:** Gender Constancy refers to the knowledge that gender is a permanent and unchangeable feature of oneself.
8. **Differentiate between Gender Stability and Gender Consistency.**
    - **Answer:** Gender Stability refers to the awareness that gender is a

Compiled by A.N.Khuram

stable personal characteristic, whereas Gender Consistency refers to the belief that gender remains fixed and unalterable even when appearances or actions change.

9. **At what age do most children successfully demonstrate Gender Constancy?**

    - **Answer:** Most children demonstrate Gender Constancy by the age of 5 years, understanding that gender is stable and consistent.

10. **What external variables contribute to the development of gender identity?**

    - **Answer:** External variables such as parental attitudes, peers and siblings, school environment, and media influence contribute to the development of gender identity.

Lesson No.19

1. **What are some of the key differences in aggression between males and females?**

    - Males tend to exhibit more physical aggression, while females engage more in relational or social aggression.

2. **Which form of aggression is considered more hurtful, especially among older children, and why?**

    - Relational aggression is considered more hurtful because it aims to cause psychic pain through social rejection and insults.

3. **Do males or females use more relational aggression, according to research?**

    - Research suggests that females use relational aggression more than males, although both genders employ this form of aggression.

4. **How do men and women differ in non-verbal communication behaviors?**

    - Women are generally more sensitive to non-verbal cues and better at interpreting body language, while men tend to display more informal and relaxed postures.

Compiled by A.N.Khuram

5. **What is the biological explanation for gender differences in aggression?**
    - The biological explanation suggests that differences in aggression are innate and based on hormonal influences.
6. **According to research, which gender tends to be more expressive and sensitive to non-verbal communication?**
    - Women have been found to be more expressive and sensitive in accurately sending and understanding non-verbal cues.

Lesson No.20

1. **Who tends to be more talkative and likely to interrupt others according to Key (1975)?**
    - Men are more talkative and likely to interrupt others, contrary to the stereotype that women are more talkative.
2. **Which gender is more likely to engage in self-disclosure, especially about emotions and personal matters?**
    - Females are more likely to engage in self-disclosure, particularly about emotions, relationships, and personal matters.
3. **According to Shafer, Pegalis, and Bazzini (1996), in what context do highly masculine men tend to disclose more?**
    - Highly masculine men tend to disclose more to women with whom they anticipate future interaction, possibly indicating an interest in exploring romantic possibilities.
4. **How do gender-role stereotypes influence self-disclosure in individuals who are insecure and socially anxious?**
    - Insecure and socially anxious individuals are likely to disclose themselves in a way that aligns with gender-role stereotypes, potentially reinforcing and perpetuating those stereotypes.
5. **What communication styles differ between men and women, according to Martin (1987) and Carli (1990)?**

Compiled by A.N.Khuram

- Women tend to use more tentative language, adding tags at the end of opinions and raising the pitch at the end of sentences, which can be perceived as less assertive and confident.

6. **In what types of topics do men and women differ in communication, based on Davidson and Duberman's study (1982)?**
    - Men and women do not differ in discussing topical issues like politics or current events but differ significantly in discussions about relational and personal topics.

7. **Do men and women differ in reciprocity in self-disclosure, according to Cozby (1973)?**
    - No, men and women show similar levels of reciprocity in selfdisclosure; if one person increases intimacy in disclosure, the other is likely to respond similarly.

8. **According to Hays and Oxley (1986), what differences were observed in social networks among first-year university students?**
    - Men included more females in their social networks compared to women, and women engaged more in the exchange of informational and emotional support within their networks.

9. **Who tends to be more willing to engage in altruistic behavior, according to Rushton et al. (1986)?**
    - More females than males report willingness to engage in altruistic behavior, motivated by a desire to improve another person's welfare.

10. **What factors contribute to gender differences in self-esteem, as suggested by Feingold (1994) and King et al. (1999)?**
    - Women's self-esteem is influenced by perceptions of interdependence and connection with others, while men's selfesteem is rooted in their unique abilities and characteristics.

Compiled by A.N.Khuram

Lesson No.21,22

1. **What is a common stereotype about men and women's intellectual abilities?**
    - The stereotype suggests that men are more intelligent and capable of wise decision-making, while women are perceived as being more emotional rather than logical or intellectual.
2. **What do empirical research findings indicate about gender differences in intelligence and cognitive ability?**
    - Empirical research findings suggest that there are no significant gender differences in overall intelligence and cognitive ability.
3. **According to the text, what were the findings regarding gender differences in IQ scores in studies by Aiken (1984) and Halpern (1986)?**
    - Studies by Aiken (1984) and Halpern (1986) showed that while there are slight differences in specific cognitive areas (e.g., verbal skills favoring females, spatial or mathematical skills favoring males), overall IQ scores do not significantly differ between genders.
4. **What is the trend observed in verbal ability across different age groups, according to Halpern (1997)?**
    - Females exhibit better verbal ability and skills than males across all age groups, with girls showing earlier language acquisition and better reading scores.
5. **How does media influence societal attitudes towards gender stereotypes?**
    - Media, particularly television and other electronic media, reinforces societal gender stereotypes by portraying men and women in stereotypical roles and behaviors.
6. **What impact does heavy television viewing have on adolescent girls' attitudes, according to Morgan (1982)?**

Compiled by A.N.Khuram

- Heavy television viewing is associated with increased sexism scores among adolescent girls from middle-class families, suggesting a negative influence on their attitudes towards gender roles.

7. **How does television contribute to observational learning in viewers, especially children and adolescents?**
    - Television programs, through characters and behaviors, provide models for observational learning, influencing viewers' attitudes and behaviors towards gender-typed beliefs.
8. **Describe the natural experiment observed in Canadian towns regarding television's influence on children's attitudes (Kimball, 1986).**
    - In Canadian towns where television became available for the first time, children's attitudes shifted towards more traditional gender stereotypes after two years of television exposure. ***The End***

Error and Omission Accepted
