MCD401 FINAL TERM OBJECTIVE FROM HANDOUTS

PREPARED BY SHOAIB MUGHAL

LEARNING WITH SM

1. The director of photography, also known as the DP or the cinematographer
2. The director of photography works with production designers, art directors, set dressers
3. The varying concentration of light-sensitive emulsions on film stock determines the color tones and the degree of graininess viewers see.
4. an urban crime drama might use a grainy stock to reflect the gritty setting and mood
5. the Academy Award-winning cinematographer who worked on "The Godfather" and its sequels
6. In rare cases, the director of photography actually operates the movie camera.
7. This (Camera Operation) involves choosing the number of cameras involved, and their placement and movement.
8. The nature of the subject will influence the amount of work needed at each stage.
9. Treatment does not have to be elaborate to make its point
10. A single look or a gesture can often have a far stronger impact than lengthy dialog
11. It is important to understand the complexity of the production.
12. PRE-PRODUCTION This is the stage in which all the planning for the project takes place.
13. PRODUCTION This is the stage at which all the filming is carried out
14. All scenes planned out in pre- production are filmed at the relevant locations.
15. POST-PRODUCTION This is the stage in which the film is assembled by the editor
16. POST-PRODUCTION This is the stage in which the film is assembled by the editor
17. The first job of the film editor is to build a rough cut taken from sequences.
18. The base is where you know exactly what facilities are available
19. The amount of detail needed about a location varies with the type and style of the production.
20. Information that may seem trivial at the time can prove valuable later in the production process.
21. The preliminary visit to a location is generally called a remote survey, site survey, or location survey.
22. It’s usually most cost-effective to shoot all of one location’s shots in a single day or period of days
23. The next crucial step in ensuring a smooth film production shoot is to create shooting scripts.
24. This makes it easier for everyone to stay on track and in the right headspace.

Learning with SM

25. Check in with your crew members and make sure they have all the equipment they need to do their jobs.
26. A wide range of video programs can be described as “instruction.”
27. There are some subjects that cannot really be demonstrated effectively in a video program.
28. Instead, directors have to rely on verbal descriptions of processes.
29. In fact, the more familiar it is, the more difficult it can be to make the program interesting and hold the audience’s attention.
30. A good instructional program is designed to fit its audience
31.. A successful program encourages curiosity and intrigues, leaving the audience with a sense of satisfaction and fulfillment.
32. Instructional programs can take anything from a few minutes to years to complete.
33. Directors often need to stretch or condense time in various ways to suit the occasion.
34. directors have to rely on verbal descriptions of processes.
35. Development The first stage in which the ideas for the film are created
36. Pre-production Preparations are made for the shoot, in which cast and film crew are hired, locations are selected, and sets are built.
37. Production The raw elements for the film are recorded during the film shoot
38. Post-production The images, sound, and visual effects of the recorded film are edited.
39. Distribution The finished film is distributed and screened in cinemas and/or released to home video.
40. Another way is to produce a scriptment once a synopsis is produced.
41. producers often skip the previous steps and develop submitted screenplays .
42. The producer and screenwriter prepare a film pitch, or treatment, and present it to potential financiers
43. A **roduction** budget is drawn up to plan expenditures for the film.
44. In production, the video production/film is created and shot.
45.. Actors usually have their own separate call times.
46. If the director decides additional takes are required, the whole process repeats.
47. Animated films have different workflow at the production phase.
48. Filmmaking also takes place outside of the mainstream and is commonly called independent filmmaking.
49. the Internet has allowed for relatively inexpensive distribution of independent films on websites such as YouTube.
50. Motion-picture camera, also called Movie Camera
51. Exposures are made at the rate of 24 or 30 frames per second on film.
52. The motor-driven transport system is the chief element that differentiates motion-picture cameras from still cameras.
53. A mechanical claw pulls the film into position behind the shutter, locking the film momentarily in place.

Learning With SM

54. Most cameras now use the reflex system for viewing and focusing.
55. Zoom lenses are commonly used on many cameras, as are ordinary wide-angle and telephoto lenses.
56. The shutter is located behind the lens and in front of the film gate
57. Technological advancements in these areas expand the creative potential of the filmmaker.
58. Even restricted to the confines of what Tom Gunning calls “cinema of attractions,” the dominant paradigm before 1908.
59. The early films of Edison and Dickson were simple.
60. Thompson and Bordwell detail Impressionist uses of the camera’s optical devices
61. Depth and distance can look unnaturally compressed in the shot.
62. The wide-angle and telephoto shots can be taken while standing in one place and exchanging lenses.
63.. ZOOM LENS allows the camera operator to zoom in and zoom out on a subject without moving the camera forward or backward.
64. Most video and television camera s come with optical zoom lenses.
65. A camera might, for instance, have a 20 optical zoom and 100 digital zoom.
66. the focal length of the lens does not just determine the image size
67. The background is magnified at the same time as the foreground subject
68. An increasing number of consumer video cameras are fitted with a lens system that combines both an optical zoom and a digital zoom
69. Zoom lens remote controls are an i m p o r t a n t tool for c a m e r a operators
70. Shorter focal length lenses provide a wider field of view,
71. The aperture determines how much light the lens transmits to the image sensor.
72. Wide Angle Lens enables you to capture a comparatively wider angle of view.
73. Telephoto lenses (100mm - 800mm) can provide you with a narrow field of view
74. Zoom lenses have variable focal lengths, and are extremely useful.
75. Fisheye lens distorting the perspective and creating a 180° image.
76. The Tilt-Shift lens enables you to manipulate the vanishing points.
77. Light rays from nearer objects form an image in a plane behind the focal plane.
78. When the image is smaller than the object, the magnification of the object is less than 1.0.
79. A normal camera lens usually has a focal length approximately equal to the diagonal of the picture format covered.
80., if the focal length is 50 millimeters and the diameter of the incident light beam is 25 millimeters, the f-number is 2
81. A normal lens should cover an angle of at least 60°. A wide-angle lens covers a greater angle—about 70° to 90° or more for an ultra-wide-angle lens.
82. Aberrations arising from some of the lens elements then counteract opposite aberrations produced by other elements.

Learning With SM

83. Lenses usually consist of optical glass.
84. Color-corrected lenses largely eliminate these faults.
85. Images formed by the lens at large apertures are therefore un sharp but get sharper at smaller apertures.
86. The film lab thus needs various apparatus from developing equipment and machines
87. Film stock is the basic component of all motion pictures.
88. 19th century, the motion picture world has undergone constant revolution through the development and improvement of film.
89. film cameras were often unique to their creators, leading to all kinds of variation in the size of film used.
90. In purchasing film stock for a motion picture, speed and resolution are two key qualities to consider.
91. **8 mm** film typically has the lowest resolution, while **35 mm** film is the standard form almost all major motion pictures.
92. The film stock also contains yellow, magenta and cyan dyes that are released during processing to give a full spectrum of color.
93. The right camera depends on how the end production is going to be used.
94. Television and film competitions are being won by directors who are using cameras that cost less than $1,000.
95. Most productions are created with a camera that is a stand-alone unit; they are known as single- camera productions.
96. **Camera craft** Most video cameras are easy to operate at the basic level.
97. The weakness of automatic controls is that the camera is only designed to make technical judgments.
98. Communicating visually will always depend on how you use the camera and the choices you make.
99. Electronic News Gathering (ENG) or Electronic Field Production (EFP).
100. The manual zoom control lens ring allows the camera operator to zoom in and out manually.
101. The focus control ring on a lens allows the camera operator to turn the ring manually to obtain the optimal focus.
102. The lens aperture control ring allows the camera operator to adjust the lens iris manually to control exposure.
103. Clip-on camera batteries allow the camera operator to carry multiple batteries.
104. **Skilled editing** makes a major contribution to the effectiveness of any production. / **Poor editing** can leave the audience confused and bored.
105. editing or postproduction is the process of combining individual shots in a specific order
106. A series of similar subjects may be shot that have reached different stages.
107. The **original footage** is placed into the player and then is edited to the recorder.

Learning with SM

108. Today almost all video and television programs are edited on a nonlinear editor.
109. A single lightweight camera is independent
110. Shooting with a single camera will often involve interrupting or repeating the action in order to reposition the camera.
111. A multi-camera production director simply switches from one camera to another.
112. In a live multi-camera production, most of the shot transitions are made on a production switcher.
113. A sitcom is a good example of a scene- by-scene multi-camera television production.
114. It is fairly simple to sync multiple cameras together on even some of the lowest cost nonlinear editing systems.
115. As in a slide projector there are essential optical elements
116. The Xenon arc lamp was introduced in Germany in 1957 and in the US in 1963.
117. A curved reflector redirects light that would otherwise be wasted toward the condensing lens.
118. Dousers protect the film when the lamp is on but the film is not moving.
119. A rotating petal or gated cylindrical shutter interrupts the emitted light during the time the film is advanced to the next frame
120. Modern shutters are designed with a flicker-rate of two times (48 Hz) or even sometimes three times (72 Hz) the frame rate of the film
121. Higher rate shutters are less light efficient
122. Imaging lenses also differ in aperture and focal length.
123. As each reel is taken off of the projector.
124. Some projectors can even accommodate up to 6000 feet (1,830 m),
125. the film is then wound onto a horizontal rotating table called a platter
126. The standard 0.048 mm aperture size derives from a drill bit used by an employee of Kodak.
127. The Selwyn granularity is defined as: where σ is the RMS granularity and a is the aperture area.
128. In general, as the pixels from a digital image sensor are set in straight lines.
129. The effect of film grain can be simulated in some digital photo manipulation programs
130. If you are shooting continuous action with a single camera and want to change the camera's viewpoint you have to use Multicamera production
131. A curved reflector redirects light that would otherwise be wasted toward the condensing lens.
132. Imaging lens Diastar of an Askania 35mm movie projector (focal length: 400 mm)

Learning With SM

133. Switchable projection screen can be switched between opaque and clear by a safe voltage under 36V AC
134. A changeover with this system is often clearly visible as a wipe on the screen.
135. The way the film is fed from the platter to the projector is not unlike an eight-track audio
136. The single reel system can allow for the complete automation of the projection booth operations,
137. Smooth wheels with triangular pins called sprockets
138. Rallycross car pictured on an Agfa 1000 RS slide
139. Color prints have been developed since the 19th century
140. Almost all color print film made today is designed to be processed according to the C-41 process
141. The subsampling in a video system is usually expressed as a three part ratio.
142. In effect every 12th film frame is displayed for the duration of 3 PAL fields (60 milliseconds)
143. the other 11 frames are all displayed for the duration of 2 PAL fields (40 milliseconds)
144. A true zoom lens, also called a parfocal lens,
145. The Steadicam was invented by cameraman Garrett Brown and was introduced in 1975
146. In its lightest configuration, the Merlin weighs just 12.5 ounces (0.35 kg).
