Question # 2 of 10 (Start time: 03:42:33 PM, 10 July 2023)

Unlike_____, the creoles resemble the structural rules of other languages.

Select the correct option

- ○ standard dialects
- ○ dialects
- ● pidgins ✓
- ○ idiolects

creoles resemble

Thus, creole languages are largely invented by children and show fundamental similarities, which derive from a biological program for language. The structures of Hawaiian Pidgin and Hawaiian Creole are contrasted, and evidence is provided to show that the latter derived from t former in a single generation

The Language Bioprogram

Unlike pidgins, the creoles resembled the structural rules of other languages. From these observations, Bickerton (1983, 1984) concludes that children have an innate grammar that, in t absence of proper environmental input, serves as the child's language system. He calls this system the Language Bioprogram.

Children's creoles was based on their access to English, the language of the plantation owners (Bickerton, 1984).

Linguistic features not attributable to English could be derived from the original native

Question # 6 of 10 (Start time: 03:37:26 PM, 10 July 2023)

In evolutionary terms, speech may be an example of_____.

Select the correct option

- ○ equality
- ○ eternity
- ● exaptation ✓
- ○ maturity

speech may be an

Natural language, as Pinker and Bloom have argued, is compatible with the Darwinian concept of natural selection. We still need to identify the sequence of events that led to language as we know it today. No one is quite sure exactly what happened, but there have been some interesting conjectures that lead to testable predictions.

- Spoken language developed quite recently in our evolutionary history.
- In evolutionary terms, speech may be an example of exaptation.
- A functionally modern human vocal tract may have emerged only 125,000 to 150,000 years ago (Lieberman ,1991; 1998).
- These findings imply that speech is a relatively recent evolutionary development.
- Our brain increased substantially in size much earlier, perhaps as far back as 2 to 3 million years ago.

Select the correct option

- ○ linguistic ✓
- ○ poetic
- ○ literary
- ○ psychological

linguistic real

mode of processing.

To conclude, most mental functions are distributed across the hemispheres but there are sp processes that are specialized to one hemisphere.

Contributions of the Right Hemisphere

The right hemisphere (RH) has some talents in the linguistic realm. Normal individuals us skills of both hemispheres to comprehend and produce language, so we need to examine a the ways that the two hemispheres interact during language use.

117

- Right hemisphere is better prepared than the left to appreciate some of the pragmat aspects of language.
- Ability of individuals with RH brain damage to interpret conversational remarks (

ENG511 - Psycholinguistics (Quiz No.3)

Question # 9 of 10 (Start time: 01:47:13 PM, 10 July 2023)

Darwinian Theory is based on the concept of _____.

Select the correct option

- inferiority
- proximity
- superiority
- continuity ✓

darwinian theory

linguistic skills of any nonhuman primates, their linguistic accomplishments to date appear to short of language as we ordinarily use the term.

The Continuity Debate

Communication skills of nonhuman primates, studied either in the wild or in the laboratory, f well short of the full range of human language. In the wild, nonhuman primates display signa that have meaning, but the signals fail to achieve some of the defining characteristics of language. Moreover, the system of communication is very limited.

- Human language is qualitatively different than the communication systems of nonhun primates.
- Darwinian theory is based on the concept of continuity, the notion that evolutionary changes are quantitative rather than qualitative.
- Some prominent theorists have argued that language evolved very rapidly, in a single step.
- Pinker and Bloom argue that a language that is qualitatively different tha communication may have evolved by the process of natural selection.
- Evolutionary theory assumes that there is genetic variation between individuals in a species.
- The intermediate steps that led to the evolution of language do not have obvious surv value.

d language has been

Lecture 24

The Language Bioprogram Hypothesis

One version of how innate processes operate in child language has been called the language bioprogram hypothesis by Bickerton (1981, 1999). Bickerton's claim, is that we, as children have an innate grammar that is available biologically if our language input is insufficient to acquire the language of our community.

Pidgins and Creoles:

ENG511 - Psycholinguistics (Quiz No.3)

Question # 10 of 10 (Start time: 12:51:23 PM, 10 July 2023)

The nervous system in humans is predominantly_____.

Select the correct option

- ○ superlateral
- ○ contralateral ✓
- ○ quasilateral
- ○ materialistic

is predominantly

plit-brain is a term to describe the result when the Corpus Callosum connecting the
vo hemispheres of the brain is severed to some degree.

t is an association of symptoms produced by disruption of or interference with the connection
etween the hemispheres of the brain.

- The nervous system in humans is predominantly contralatera.
- When a stimulus is presented to the left visual field, the right hemisphere (RH) of a spli brain patient becomes aware of the stimulus.
- Certain aspects of language are better represented in the (RH) than others.
- Relative to the (LH) , the (RH) also shows phonetic deficits.

ENG511 - Psycholinguistics (Quiz No.3)

Question # 9 of 10 (Start time: 12:50:24 PM, 10 July 2023)

Teaching language to other primates divided into _____groups.

Select the correct option

- two
- five
- four
- three ✓

other primates

Teaching Language to Non-Human Primates

Some researchers have tried to teach apes to use language. Because of the structure of their vocal organs, apes can't say words, but they can communicate using signs or computers. Using these means, apes can make requests, respond to questions, and follow instructions.

- Teaching language to other primates divided into three groups.
- In the first group, attempt made to teach speech to chimpanzees.
- A second group involved programs in which the communication system was not clearly defined in linguistic terms.
- A third group (to teach them American Sign Language).

ENG511 - Psycholinguistics (Quiz No.3)

Question # 8 of 10 (Start time: 12:49:20 PM, 10 July 2023)

Unlike_____, the creoles resemble the structural rules of other languages.

Select the correct option

- ○ pidgins ✓
- ○ standard dialects
- ○ dialects
- ○ idiolects

creoles resemble

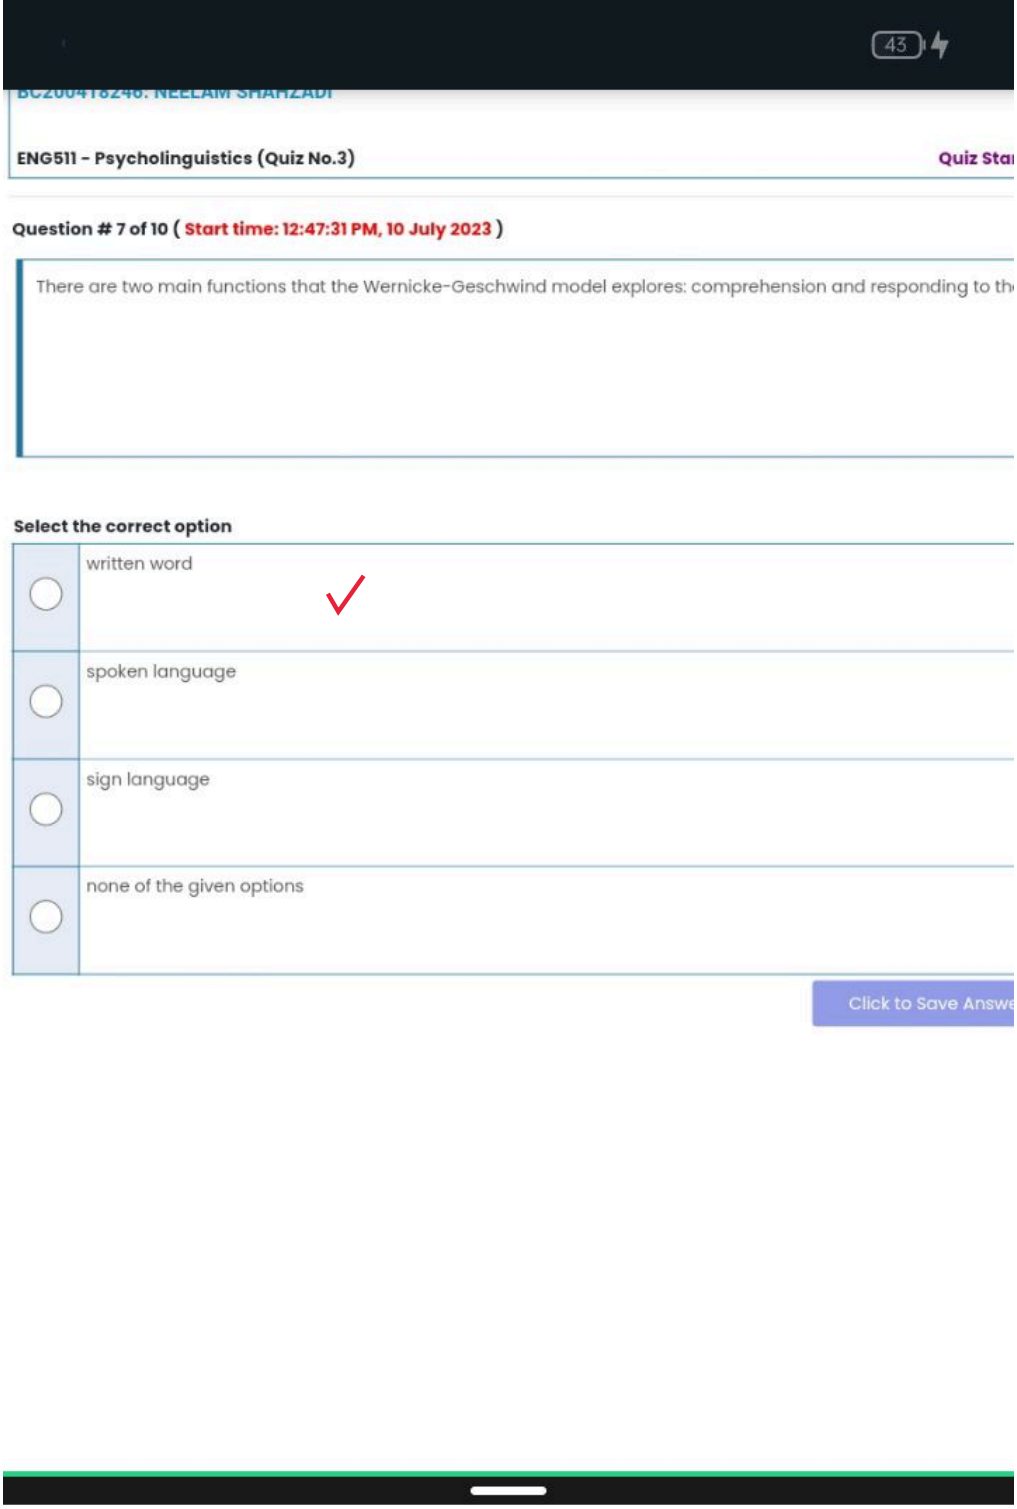

Thus, creole languages are largely invented by children and show fundamental similarities, which derive from a biological program for language. The structures of Hawaiian Pidgin and Hawaiian Creole are contrasted, and evidence is provided to show that the latter derived from former in a single generation

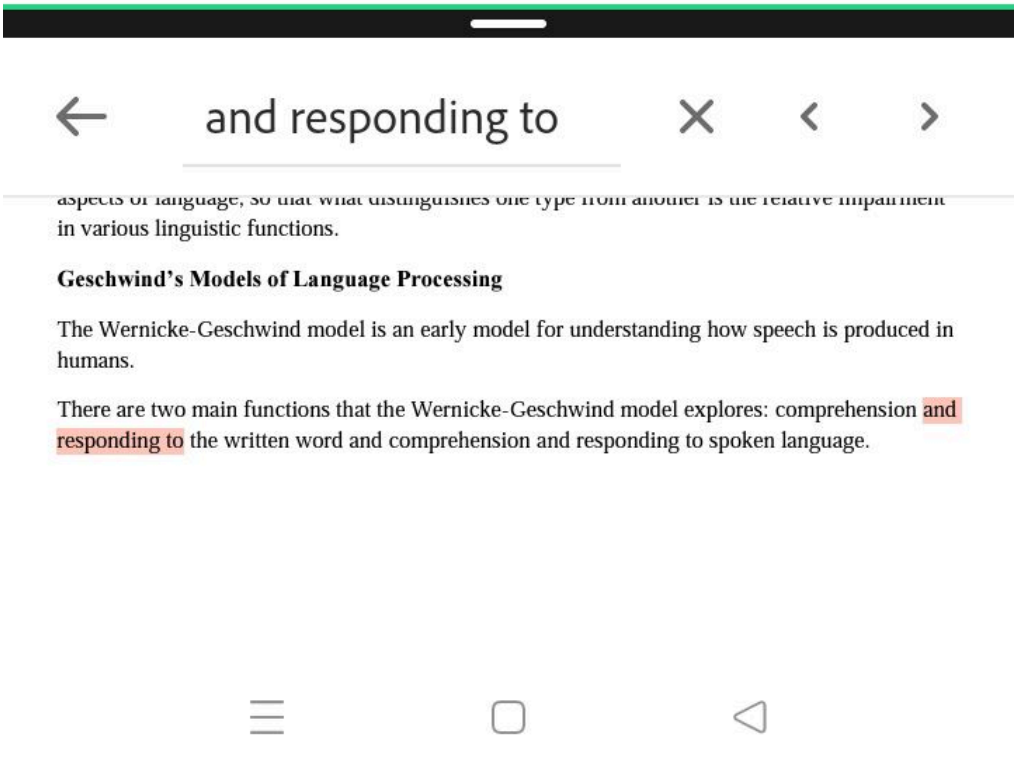

The Language Bioprogram

Unlike pidgins, the creoles resembled the structural rules of other languages. From these observations, Bickerton (1983, 1984) concludes that children have an innate grammar that, in absence of proper environmental input, serves as the child's language system. He calls this system the Language Bioprogram.

Children's creoles was based on their access to English, the language of the plantation owners (Bickerton, 1984).

Linguistic features not attributable to English could be derived from the original native

aspects of language, so that what distinguishes one type from another is the relative impairment in various linguistic functions.

Geschwind's Models of Language Processing

The Wernicke-Geschwind model is an early model for understanding how speech is produced in humans.

There are two main functions that the Wernicke-Geschwind model explores: comprehension and responding to the written word and comprehension and responding to spoken language.

ENG511 - Psycholinguistics (Quiz No.3)

Question # 6 of 10 (Start time: 12:46:01 PM, 10 July 2023)

In evolutionary terms, speech may be an example of_____.

Select the correct option

- ○ eternity
- ○ exaptation ✓
- ○ maturity
- ○ equality

speech may be

Natural language, as Pinker and Bloom have argued, is compatible with the Darwinian concept of natural selection. We still need to identify the sequence of events that led to language as we know it today. No one is quite sure exactly what happened, but there have been some interesting conjectures that lead to testable predictions.

- Spoken language developed quite recently in our evolutionary history.
- In evolutionary terms, speech may be an example of exaptation.
- A functionally modern human vocal tract may have emerged only 125,000 to 150,000 years ago (Lieberman ,1991; 1998).
- These findings imply that speech is a relatively recent evolutionary development.
- Our brain increased substantially in size much earlier, perhaps as far back as 2 to 3 million years ago.

ENG511 - Psycholinguistics (Quiz No.3)

Question # 5 of 10 (Start time: 12:44:09 PM, 10 July 2023)

Lateralization is not limited to humans or even to _____.

Select the correct option

- primates ✓
- inanimate objects
- concrete objects
- material objects

lateralization is not

- To conclude, behavioral and psychological studies have been applied to child with normal development by using dichotic listening and conclude that lateralization is present at birth.

Development of Lateralization& Lateralization in Other Species

Lateralization is not limited to humans or even to primates. Japanese macaque monkeys show lateralization of species-specific vocalizations, and anatomical arrangements in songbirds are analogous to those in humans. This evidence suggests that human lateralization for speech is part of a larger evolutionary pattern.

ENG511 - Psycholinguistics (Quiz No.3)

Question # 4 of 10 (Start time: 12:43:16 PM, 10 July 2023)

Negative evidence is the evidence that a particular utterance is_____

Select the correct option

- ○ partially grammatical
- ○ fully grammatical
- ○ ungrammatical ✓
- ○ none of the given options

negative evidence

Thus, Children learning fixed-word-order languages generally stick to the orders used by their parents. Children learning free-word-order languages appear to use only some of the permissible orders of their language, at least in certain circumstances.

The Issues of Negative Evidence

At the grammatical level, positive evidence is evidence that a particular utterance is grammatical in the language that the child is learning; negative evidence is evidence that a particular utterance is ungrammatical.

- Children receive negative evidence when someone indicates that a particular utterance is ungrammatical
- Pinker (1990) argues that it would be very difficult to acquire a language from positive evidence alone.
- Parents do not provide sufficient negative evidence to enable a child to learn a language.

ENG511 - Psycholinguistics (Quiz No.3)

Question # 3 of 10 (Start time: 12:42:05 PM, 10 July 2023)

_____is a very strict word-order language.

Select the correct option

- ○ English ✓
- ○ Russian
- ○ French
- ○ Dutch

strict word

in the parameter settings, although this point has been disputed.

The Subset Principle

Whenever there are two competing grammars generating languages of which one is a proper subset of the other, the learning strategy of the child is to select the less inclusive one.

- English is a very strict word-order language, Russian allows a small set of admissible orders, and the aborigine language Warlpiri allows an almost total scrambling of word order within a clause.
- Children must induce this system from the evidence presented to them.
- The subset principle allows for some testable developmental prediction. If fixed word order is the default value, then children all over the world should begin their linguistic careers by producing utterances that adhere to strict word order.
- If, instead, children use free word order as the default value, then overgeneration would

ENG511 - Psycholinguistics (Quiz No.3)

Question # 2 of 10 (Start time: 12:40:58 PM, 10 July 2023)

Wernicke's Aphasia was discovered by _____.

Select the correct option

- ○ Kim Wernicke
- ○ John Wernicke
- ○ Carl Wernicke ✓
- ○ Sau Wernicke

Wernicke

the left hemisphere of brain.

Wernicke's and Conduction Aphasia

- Carl Wernicke discovered a different form of aphasia. Wernickes aphasia results from damage to a region in the left temporal lobe near the auditory cortex. This region is now called Wernicke's area.
- A third major type of aphasia is conduction aphasia, which is a disturbance of repetition.
- Wernicke's aphasia, also known as receptive aphasia, in which individuals have difficulty understanding written and spoken language. Common symptoms seen in patients with Wernicke's aphasia:
- Impaired Comprehension

ENG511 - Psycholinguistics (Quiz No.3)

Question # 1 of 10 (Start time: 12:39:32 PM, 10 July 2023)

The right hemisphere (RH) has some talents in the _____realm.

Select the correct option

- ○ psychological
- ○ linguistic ✓
- ○ poetic
- ○ literary

right hemisphere

- LH prefers to process information in a relational manner, whereas the RH uses a holistic mode of processing.

To conclude, most mental functions are distributed across the hemispheres but there are specific processes that are specialized to one hemisphere.

Contributions of the Right Hemisphere

The right hemisphere (RH) has some talents in the linguistic realm. Normal individuals use the skills of both hemispheres to comprehend and produce language, so we need to examine some of the ways that the two hemispheres interact during language use.

- Right hemisphere is better prepared than the left to appreciate some of the pragmatic aspects of language.
- Ability of individuals with RH brain damage to interpret conversational remarks (Kaplan et al, 1990).
