The Whorf Hypothesis

- It is Whorf's view that the linguistic patterns themselves determine what the individual perceives in this world and how he thinks about it.
- Principle of relativity which holds that all observers are not led by the same physical evidence to the same picture of the universe, unless their linguistic backgrounds are similar.
- In the Indo-European languages substantives, adjectives and verbs appear as basic grammatical units, a sentence being essentially a combination of these parts.
- Indian languages, such at Nootka or Hopi do not have parts of speech or separate subject and predicate.
- Self-evident distinction between past, present and future does not exist in the hopi language.

VU

The Whorf Hypothesis

Hence, the Whorf hypothesis states that our language shapes the way we think about the world.

Linguistic Determinism and Relativity

Linguistic determinism refers to the notion that a language determines certain nonlinguistic cognitive processes. Linguistic relativity refers to the claim that the cognitive processes that are determined are different for different languages.

Linguistic Determinism and Relativity

- Linguistic Determination and Relativity ,first introduced by Edward Sapir and expanded by his student Benjamin Lee Worf, the Sapir-Whorf Hypothesis .
- Linguistic determinism is the idea that language and its structures limit and determine human knowledge or thought, as well as thought processes such as categorization, memory, and perception.
- Different languages represent different ways of thinking about the world around us. This view has come to be called linguistic relativity.
- One practical consequence of linguistic relativity: direct translation between languages isn't always possible.

Linguistic Determinism and Relativity

- Linguistic Determination and Relativity ,first introduced by Edward Sapir and expanded by his student Benjamin Lee Worf, the Sapir-Whorf Hypothesis .
- Linguistic determinism is the idea that language and its structures limit and determine human knowledge or thought, as well as thought processes such as categorization, memory, and perception.
- Different languages represent different ways of thinking about the world around us. This view has come to be called linguistic relativity.
- One practical consequence of linguistic relativity: direct translation between languages isn't always possible.

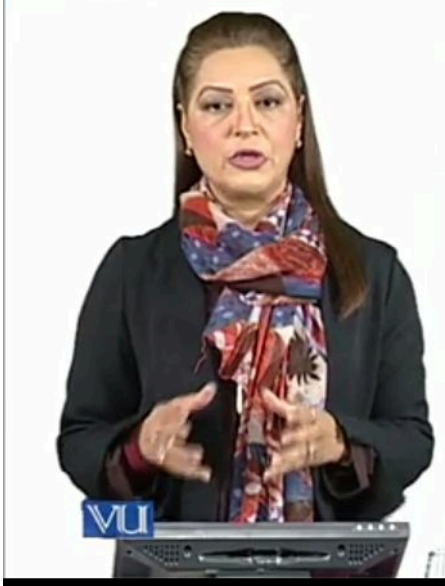

Linguistic Determinism and Relativity

To conclude, Whorf hypothesis states that our language shapes the way we think about the world. This hypothesis consists of two parts: Linguistic determinism which states that languages determines cognitive processes, and linguistic relativity states that the resulting thought processes vary from language to language.

Some Whorfian Examples: Lexical Examples

Whorf provided a number of examples designed to show that linguistic determinism and relativity were valid concepts. They can be broadly organized into lexical and grammatical examples.

Some Whorfian Examples: Lexical Examples

Lexical Examples:

Differentiation: refers to the number of words in a given domain (e.g , colors, birds, fruits, and so on) in a lexicon.

Languages differ in the domains that are most differentiated.

Whorf noted that in the American Indian language of Hopi, just one word covers everything that flies except birds.

Whorf suggested that there is no "natural" way to carve up reality; different languages do it in quite different ways.

The number of words in a lexicon varies with how one defines the word.

Languages differ in the degree to which they differentiate various lexical domains does not seem to be at issue.

Some Whorfian Examples: Lexical Examples

So, Whorf's example is a evidence of linguistic determinism, of the power of words to influence thought processes. He believes that when we encounter a word on regular basis , it does affect our thought pattern.

Grammatical Examples

Whorf provided a number of grammatical examples too. Although some of Whorf's lexical examples, on Eskimo, have generated a considerable amount of discussion, it appears that he was more interested in the grammatical differences among languages.

Grammatical Examples

- In English, we come to respect the difference between nouns and verbs as a fundamental distinction.
- Another example of grammatical diversity concerns the extent to which a language uses word order or morphology to signal meaning.
- Some of the grammatical distinctions that are found in other languages do appear to be semantically significant.
- Whorf believed that grammatical distinctions such as these exert an effect on not just the way individuals think but also their overall world view.
- In English, there is a distinction between what Whorf called individual nouns (more commonly called count nouns) and mass nouns.
- In contrast, in Hopi, there are no mass nouns.

Grammatical Examples

So, Whorf's has provided number of examples to show the grammatical differences among languages. His examples clearly show the concepts of linguistic determinism and linguistic relativity.

Theory 1: Speech is Essential for Thought

Speech is essential for thought: We must learn how to speak aloud, otherwise we cannot develop thinking.

Proponents: (a) Thought is a kind of behaviour, speech, which originates from speech production (b) Thought develops as a kind of speech - By speaking aloud, you start to speak sub vocally or make internal articulations.

Theory 1: Speech is Essential for Thought

- Why is speech production not necessary in order to think? **Inadequacies of the theory**

1) *Children having no speech production can comprehend and think.*
2) *Speech comprehension, which implies thought, develops from speech production in normal children*
3) *Simultaneously speaking aloud while thinking about something different.*
4) *Telling a lie*
5) *Meaning and thought occur without behaviour*
6) *Interpreting between languages can be done*

Theory 1: Speech is Essential for Thought

All of these 6 objections to the theory show that speech production is not necessary for thought.

Theory 2: Language is Essential for Thought

We must learn language, how to produce or understand speech, otherwise we cannot develop thinking.

Proponents:

a) The language system, with its rule or vocabulary, is necessary for thought.

b) Thought was derived from speech production.

c) Thought is supposed to be language-specific and not universal.

Theory 2: Language is Essential for Thought

Inadequacies of the theory:

1) *Deaf persons without language can think.*

- If one holds that language is the basis for thought, then these deaf children do not think and that they were merely robots.

2) *Multilingual are whole persons.*

- According to this theory, if multilingual have more than one thought process (one for each language), such persons would not be able to think coherently or would have separate thought intelligences/ personalities.

3) *Intelligent animal behavior occurs without language.*

- Thought must have some basis other than language. The following examples can prove this statement.

VU

Theory 3: Language Determines Shapes of Nature

Language determines or shapes our perception of nature : The learning of language will determine or influence the way we perceive the physical world, visually, auditory .

Proponent:

- One's knowledge of vocabulary or syntax influences one's perception and understanding of nature.

Theory 3: Language Determines Shapes of Nature

Inadequacies of the theory:

1) Perception, interest and need determine vocabulary.
2) Colour and snow vocabulary
   - Colour words
   - Snow words
3) *Hopi 'Time' and Chinese 'Counterfactuals'*
   - Hopi people and time
   - The Chinese language and 'counterfactuals
4) *Lack of vocabulary does not indicate lack of concept*
5) *Knowledge overrides literal word meanings.*
6) *Multilingual's view of nature*

Theory 3: Language Determines Shapes of Nature

All of these 6 objections to the theory show that there is no foundation to the claim that vocabulary affects our view of nature.

Erroneous Beliefs Underlying the Four Theories

We will consider three such mistaken beliefs:

(1) Their analysis of language is adequate: The most serious deficiency in the theorizing of Whorf, Sapir, Korzybski, Skinner, von Humboldt, and others concerns the assumption that the directly observable words or the structure of a sentence represent all of the semantic or thought elements of that sentence.

(2) The meaning of words is linguistic in origin: there is no necessary relationship between the sound of a word and its meaning.

(3) There are primitive languages and primitive human intelligence: all languages are of similar complexity, with each having similar basic forms and operations.

VU

Testing the Whorf Hypothesis

Experimental tests of the Whorf hypothesis fall into two groups: those that examine the lexical level and those test the grammatical level. Before looking at these studies, however, let us consider what is needed to test the linguistic relativity hypothesis.

Testing the Whorf Hypothesis

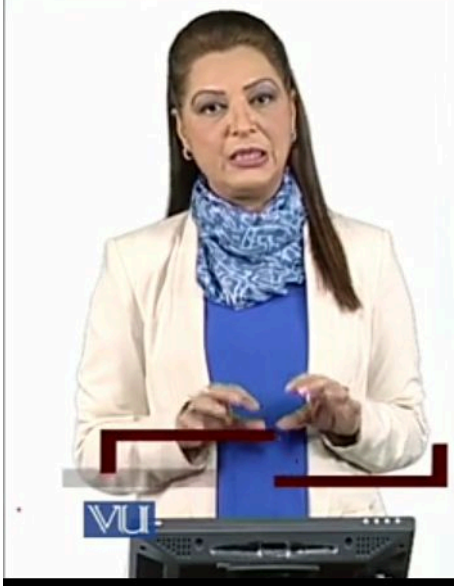

- Differences in language determine differences in thinking must, at the outset, define the three key terms.
- First, we need to define what we mean by "differences in language."
- Second, we need to define "differences in thinking" in a satisfactory manner.
- Whorf was especially interested in those aspects of thinking that indicated a habitual mode of thought.
- Finally, we need to clarify what is meant by saying that languages "determine" thought.
- The presence of linguistic categories creates cognitive categories.
- Presence of linguistic categories influences the ease with which various cognitive operations are performed.

Testing the Whorf Hypothesis

Hence, Psychological studies of the Whorf hypothesis have examined whether lexical and grammatical differences between languages influence various nonlinguistic cognitive processes.

Color Terms

At the lexical level, much work has been done on words for color. This is, in part, due to the fact that languages differ tremendously in their differentiation of the color domain. Some languages, such as English, have many color terms, and others have as few as two.

Color Terms

So, the studies of color terms have not provided strong support for the Whorf hypothesis. Other studies of the lexicon are more consistent with the hypothesis.

Cross-linguistics Studies

- The number of color terms in a language varied quite a bit from language to language, there was an underlying order
- Every language has a small number of basic color terms.
- Each language draws its basic color terms from the following list of 11 names: white, black, red, yellow, green, blue, brown, purple, pink, orange, and gray.
- Focal colors are more perceptually salient than nonfocal colors and that this salience, in turn, influences the codability and memorability of a color.
- Rosch tested Dani found that although Americans performed better on the whole, both groups' memory for focal colors was better than for nonfocal colors.
- The focal colors used by Heider were more perceptually d inable than the nonfocal colors.

VU

Number Terms

Another set of studies is relevant to how the lexicon may influence thought processes: How morphological differences in number names between Asian languages (Chinese, Korean etc) and English may influence children's conceptualization of numbers and ultimately their mathematics achievement.

Number Terms

- In English, the system of naming numbers is relatively complex.
- Asian languages such as Chinese are more regular.
- The greater regularity of Asian languages suggests that children might have an easier time acquiring number names than their English-speaking counterparts.
- Miura distinguished three approaches to the task.
- Japanese children were more than twice as likely as U.S. children to use canonical approaches on the first trial.
- The range of numbers between 11 and 99 shows the greatest differences.
- Chinese speakers pronounce numbers more quickly than English speakers.

VU

Number Terms

The studies concluded that the way that languages represent numbers influences mathematical thinking. The language one learns play an important role in mathematics education.

Miura stresses that the way one thinks about numbers is fundamentally different in Chinese versus English.

Object Terms

Recent research in how infants learn names pertaining to objects is also relevant here. Conceptual categories related to object names are constructed at the time when we learn a language, not before. If so, it is then expected to see different kinds of early object terms in children acquiring different languages.

Spatial Terms

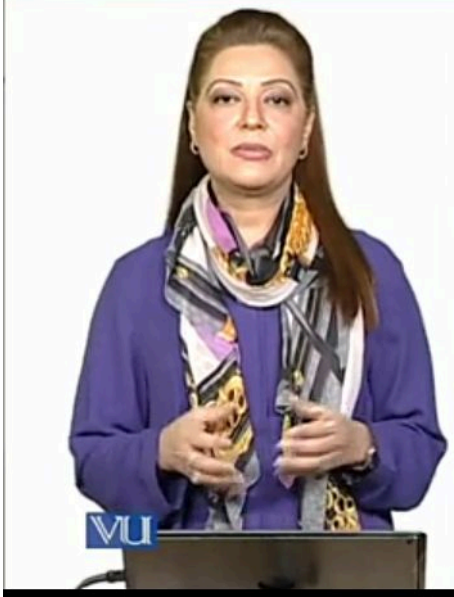

Hence, Korean and English differ in spatial terms, and children acquiring these languages appear to carve up reality in different ways. Languages also differ in the spatial frames of reference. These frames of reference influence performance on nonlinguistic spatial tasks.

The Development of Subjunctive & Complex-Syntactic

To conclude, the subjunctive research show that learners do not acquire skills and knowledge for this construct in isolation of other aspects of their IL development, and that certain internal and external factors play important role subjunctive & syntactic development.

Grammatical Marking of Form

Traditional grammars refer to grammatical forms as "parts of speech." e.g. the grammatical form of the word *dog* is noun, of the word *bite* is verb, and of the word *tiny* is adjective. *Grammatical form* also includes the internal structure of words, phrases, and clauses. Presence of a grammatical distinction in a language may increase cognitive processes.

Grammatical Marking of Objects and Substances

Languages also differ in their grammatical distinctions of objects and substances.

Count nouns refer to objects , while mass nouns refer to substances.

In English objects such as horse, candles and chairs are referred to as count nouns and smoke, air, water as mass nouns.

No importance of distinction in Japanese.

Grammatical Marking of Objects and Substances

- In Japanese, all inanimate nouns are treated like English mass nouns
- A study tested the Whorf's hypothesis found that children were quite capable of distinguishing between objects and substances
- The Japanese children treated substances as material, and the American children showed a weaker tendency to do the same
- Conceptual distinction is supported by the presence of the count –mass grammatical distinction
- Noun phrases may be distinguished by the presence or absence of the semantic features of animacy and discreteness
- Lucy (1992a) has hypothesized two cognitive consequences of these linguistic differences

Grammatical Marking of Gender

A system of grammatical gender: every noun was treated as either masculine, feminine or neuter, existed in Old English.

Preference now is for gender-neutral language.

English marks grammatical gender only in singular personal pronouns (for example, he, she, it). In contrast, other languages have much more extensive gender systems.

Final observations

Since its inception , the Sapir-Whorf hypothesis has caused controversy and generated research in a variety of disciplines including linguistics, psychology, philosophy, anthropology, and education.

Aphasia to Neurolinguistics

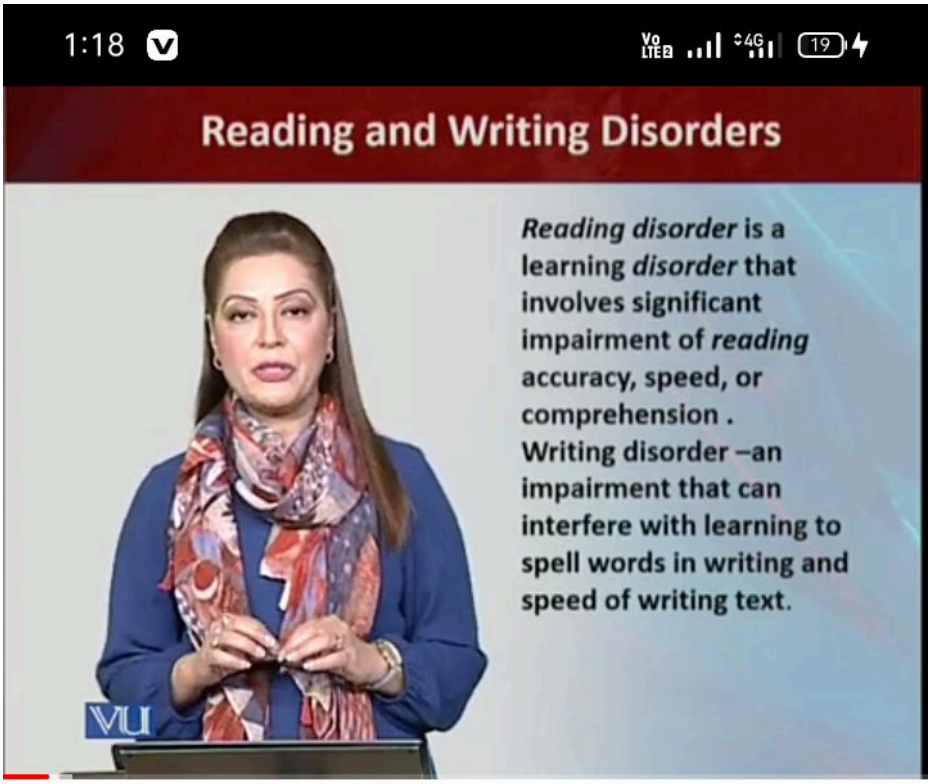

Neurolinguistics is the branch of linguistics that analyzes the language impairments that follow brain damage in terms of the principles of language structure and aphasia is an acquired language disorder subsequent to brain damage in the left hemisphere.

Aphasia to Neurolinguistics

To sum up, despite great variations in the condition, patterns of language deficits associated with different areas of brain damage have been influential in understanding language-brain relationships which is called neurolinguistics.

Phonological and Surface Dyslexia

Hence, surface dyslexia makes hard to remember whole words by sight and Phonological dyslexia is a disorder of reading characterized by impairment in non-word reading ability.

Dyslexia

Dyslexia is characterized by difficulties with accurate and / or fluent word recognition and by poor spelling and decoding abilities.
VU

Dyslexia

Dyslexia is characterized by difficulties with accurate and / or fluent word recognition and by poor spelling and decoding abilities.

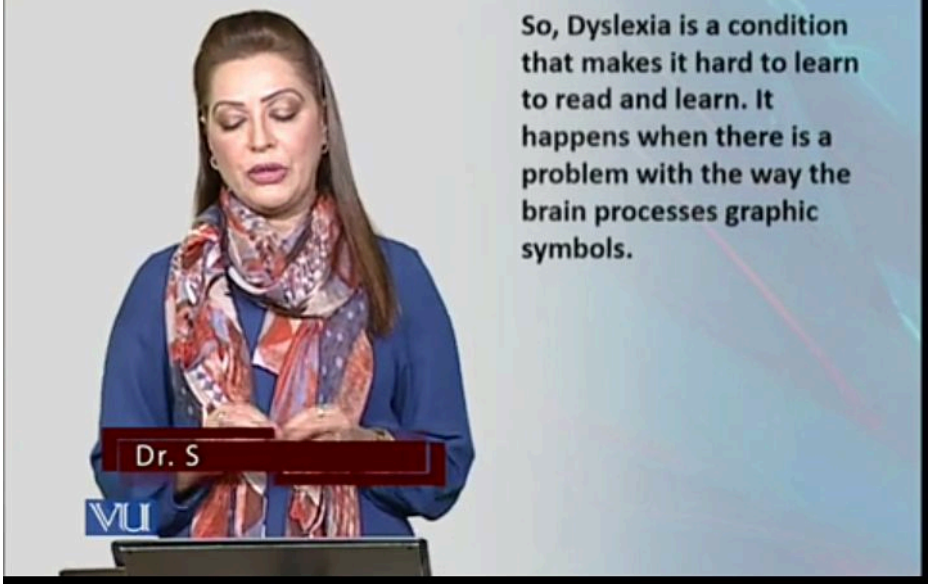

Dyslexia

- In a person with dyslexia, the brain processes written material differently
- Symptoms:
- Difficulty in learning to read
- Milestones reached later
- Delayed speech development
- Spelling
- Speech problems
- Treatment: Psychological testing: This helps teachers develop a better-targeted program for the child.
- Guidance and support: Counseling can help minimize any negative impact on self-esteem.
- On-going evaluation: developing their coping strategies and identify areas where more support is needed.

VU

1:48

Dyslexia

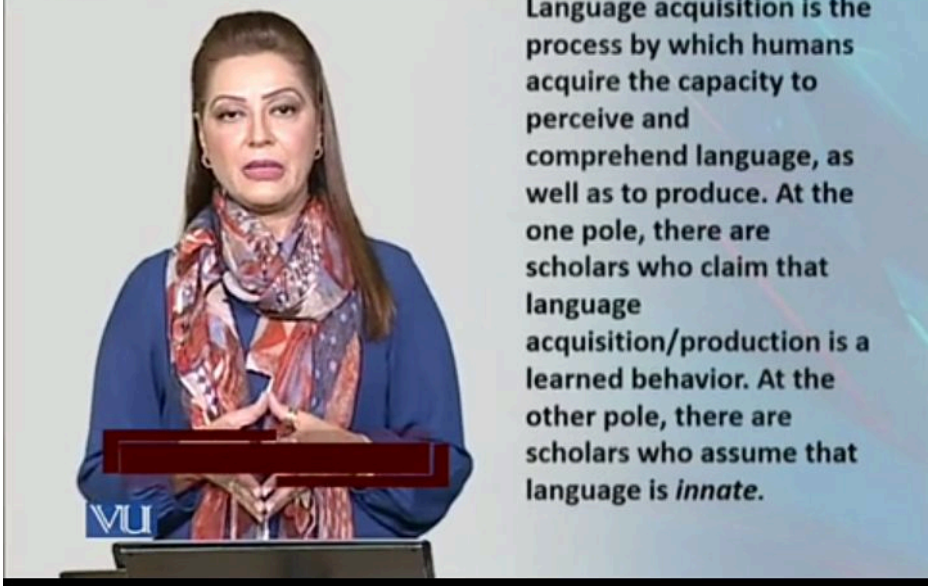

Deep Dyslexia

- Deep dyslexia is considered to be a "central dyslexia" as compared to a "peripheral dyslexia".
- Deep dyslexia is mainly characterized by the occurrence of semantic reading errors or semantic paralexia.
- Deep dysle difficulty reading abstract than concrete and able words, more difficulty reading adjectives, a uns.
- The difficul exics in reading abstract words has been referre ageability effect".
- Words with f predication scores are more easily read aloud b s than words with lower ease of predicaton s

Theories of First Language Acquisition

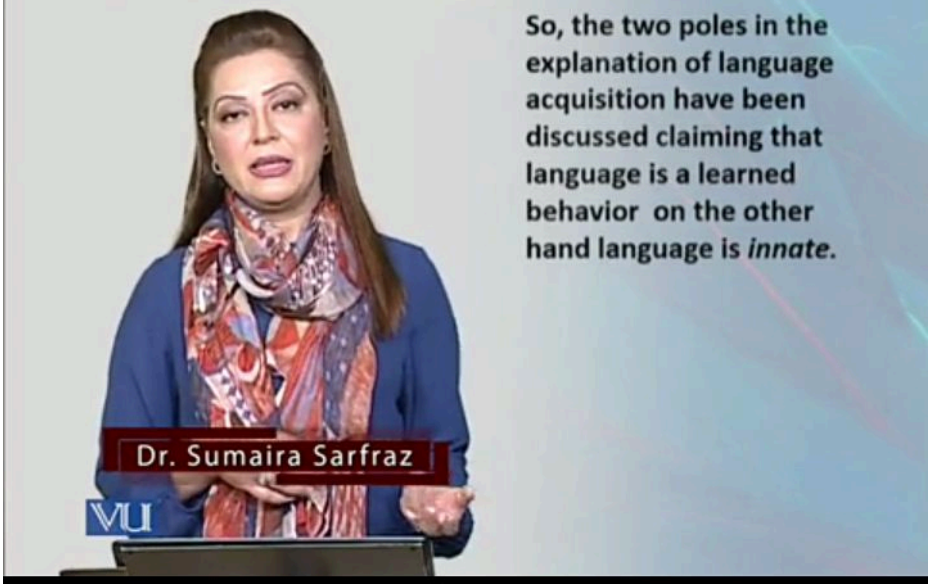

Language acquisition is the process by which humans acquire the capacity to perceive and comprehend language, as well as to produce. At the one pole, there are scholars who claim that language acquisition/production is a learned behavior. At the other pole, there are scholars who assume that language is *innate*.

Theories of First Language Acquisition

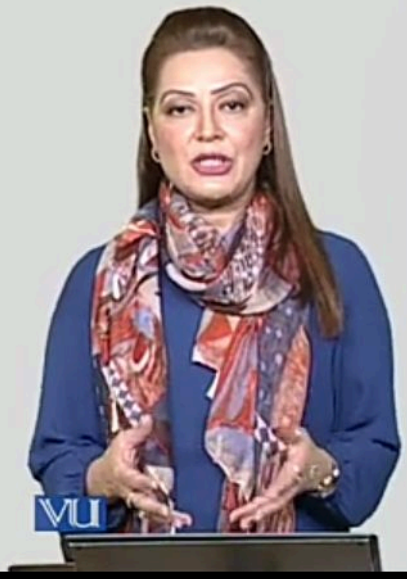

- **Behaviorist Theory by B.F. Skinner:** Learning as a behavior produced by learner's response to stimuli which can be reinforced with positive or negative feedback
  - Children learn language through imitation, repetition
- **Innatist Theory by Noam Chomsky:** Children are born with a language acquisition device (LAD) which encodes the major principles of a language and its grammatical structure into the child's brain.
  - Universal grammar is "the system of principles, conditions and rules that are elements or properties of all human languages"
- **Cognitive Theory by Piaget:** Cognitive development was a progressive reorganization of mental processes resulting from biological maturation and environmental experience.

Theories of First Language Acquisition

So, the two poles in the explanation of language acquisition have been discussed claiming that language is a learned behavior on the other hand language is *innate*.

Challenges of Approaches to L1 Acquisition

First language acquisition, has been an area of ongoing research by advocates of behaviorism and Nativism that include Skinner,Chomsky, Piaget, and Vygotsky, to name a few.

To conduct any experiment in the area, one needs to study the relevant rich literature and challenges to gain the necessary knowledge.

Challenges of Approaches to L1 Acquisition

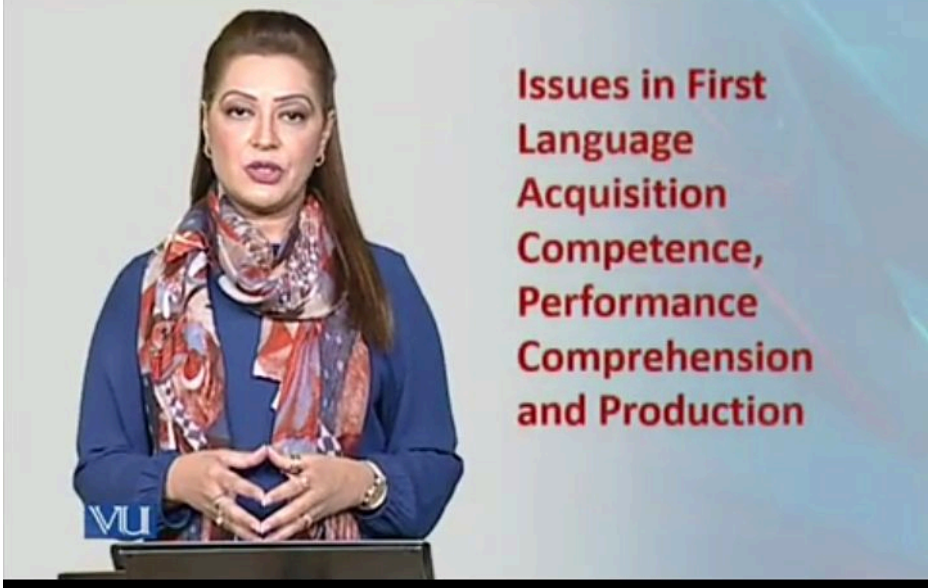

- A theory based on conditioning and reinforcement is hard-pressed to explain the fact that every sentence you speak or write—with a few trivial exceptions is novel.
- Linguistic stimulus (a word or sentence) elicits a "mediating" response that is self-stimulating.
- Child may acquire frames of a linear pattern of sentence elements and learn the stimulus-response equivalences.
- That information is processed simultaneously at several levels of attention.
- The first language acquisition of English regular past tense forms by children may proceed as a series of connections
- The complexity of language emerges from, relatively simple developmental process being exposed to a massive and complex environment.

Challenges of Approaches to L1 Acquisition

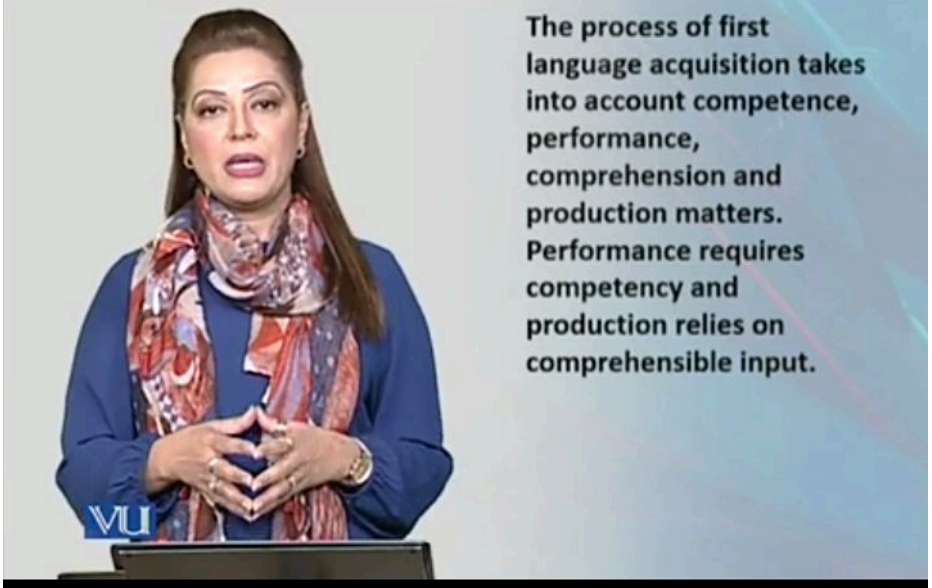

To conclude, the behaviorist and Nativist approaches face immense challenges by the contemporary researchers about their claims on first language acquisition. Some of the recent studies completely discard the concepts stimulus-response process and Universal Grammar.

Psycholinguistics

L1 Competence, performance, Comprehension & Production Issues

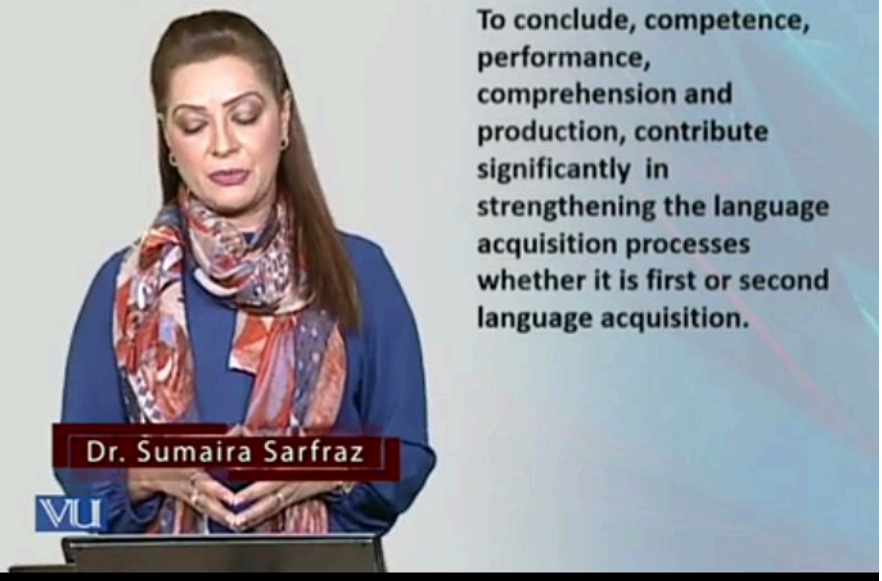

The process of first language acquisition takes into account competence, performance, comprehension and production matters. Performance requires competency and production relies on comprehensible input.

L1 Competence, performance, Comprehension & Production Issues

- Competence refers to one's underlying knowledge of a system, event, or fact.
- Performance is the overtly observable and concrete manifestation or realization of competence.
- Chomsky likened competence to an "idealized" speaker-hearer who does not display such performance variables as memory limitations, distractions, interest, errors.
- The competence-performance model has not met with universal acceptance.
- Heterogeneous competence: abilities that are in the process of being formed.
- In child language, most observational and research evidence points to the general superiority of comprehension over production.

L1 Competence, performance, Comprehension & Production Issues

Nature or Nurture , Universals, Systematicity & Variability

Nature or Nurture-debate between behaviorist Nativists.

Universals: claim language is universally acquired in the same manner, and that the deep structure of language be common to all languages.

The acquisition process is systematic but it is not clear where the limit of its stages is (variability).

Nature or Nurture , Universals, Systematicity & Variability

Nature or Nurture-debate between behaviorist Nativists.

Universals: claim language is universally acquired in the same manner, and that the deep structure of language be common to all languages.

The acquisition process is systematic but it is not clear where the limit of its stages is (variability).

Nature or Nurture , Universals, Systematicity & Variability

- Nature: language gene; LAD, UG
- innateness hypothesis (Nativism) , "bio-programmed"
- Universality of Language acquisition
- Nurture: environmental exposure
- The child's construction of reality in interaction with others
- Universals: deep structure of language: common to all
- universal linguistic categories -Word order, agreement, negation, question
- Principles: (universals) vs. parameters(variables)

Systematicity: developmental stages of LA follow a common route.

Variability: individual variations in the process of learning (rate of development).Learner language is characterized by both systematicity & variability.

Psycholinguistics

Language and Thought : Imitation, Practice and Frequency, Input, Discourse

Imitation, Practice Frequency, Input, Discourse

Thought and language were seen as two distinct cognitive operations that grow together. Imitation, Practice, Frequency, Input and Discourse are the key characteristics of understanding language acquisition processes.

Imitation,Practice Frequency,Input, Discourse

- **Language and Thought :**

•Behaviorism: cognition is too mentalistic, Piaget: language is dependent upon and springs from cognitive development, Vygotsky : language, is a prerequisite to cognitive development.

- **Imitation:** Children are good imitators

•Deep structure of language vs surface structure.

- **Practice vs. Frequency:** Do children "practice" language?

•The frequency of occurrence of a linguistic item in the speech of mothers was an strong predictor of the order of emergence of those items in their children's speech.

•**Input:** adult input shape child's acquisition& interaction patterns.

•**Discourse:** Children learn not only how to initiate a conversation + how to respond to another's initiating utterance.

L1 Acquisition Insights Appl to Language Teaching

The first instances in this "modern" era of research on language teaching drew their insights from children learning first and second languages.
Observations about language teaching helped set the stage for the development of language teaching methodologies.

L1 Acquisition Insights Appl to Language Teaching

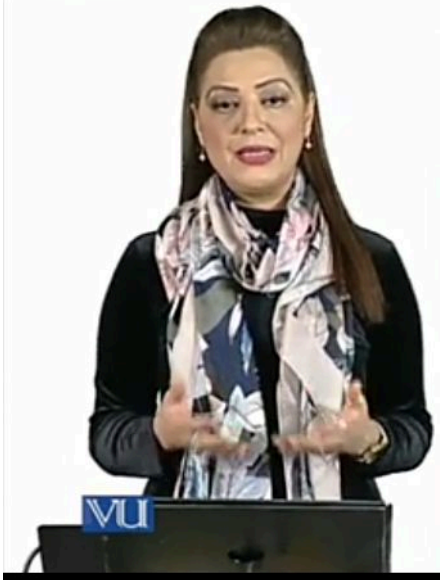

- The basic premise of Direct method was that second language learning should be more like first language learning.

1 .Classroom instruction was conducted in the target language. 2. Only everyday vocabulary and sentences were taught. 3. Grammar was taught inductively. 4. New teaching points were introduced orally. 6. Concrete vocabulary was taught 7. Both speech and listening comprehension were taught. 8. Correct pronunciation and grammar were emphasized.

- The Direct Method did not take well in public education.
- Direct Method was revived and redirected into what was probably the most visible of all language teaching "revolutions" in the modern era.
- Children use language to represent their conceptions.

VU

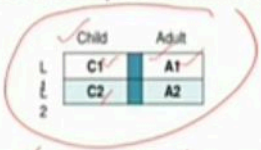

Children vs. Adults in SLL- The Critical Period Hypothesis

Language acquisition starts in very early childhood, but SLA can happen in childhood, early or late, as well as in adulthood. Children acquiring their first language easily and well, yet individuals learning a second language, particularly in an educational setting, can meet with great difficulty and sometimes failure.

Children vs. Adults in SLL- The Critical Period Hypothesis

Types of comparison and contrast

(C1 – C2)
First and second language acquisition in children, holding **age constant**

(C2 – A2)
Second language acquisition in children and adults, holding **second language constant**

(C1 – A2)
First language acquisition in children and second language acquisition in adults

The CPH claims that there is such a biological timetable, SLA occurs around puberty, beyond which people seem to be relatively incapable of acquiring a second language.

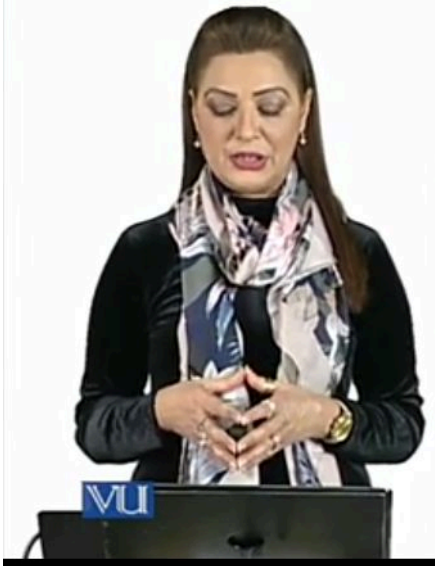

One needs to approach the comparison by first considering the differences between children and adults.
A 2-year-old and an 11-year-old exhibit vast cognitive, affective, and physical differences.
In C2-A2 comparison, one is holding language constant and manipulating the differences
CI-A2, unfortunately manipulates both variables.

Children vs. Adults in SLL- The Critical Period Hypothesis

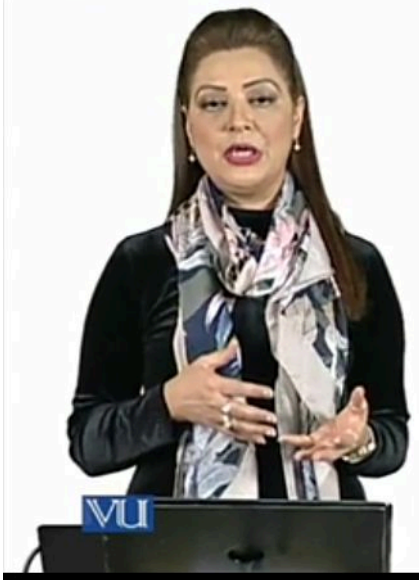

To sum up, studies on children vs adults in SLL show that acquiring a first language is easy , but learners face difficulty in second language learning and sometimes face failure in attaining native like proficiency as per CPH.

Psycholinguistics

Neurobiological Considerations Hemispheric Lateralization

Neurobiological Considerations Hemispheric Lateralization

One of the most promising areas of inquiry in age and acquisition research has been the study of the function of the brain in the process of acquisition.

Neurobiological Considerations Hemispheric Lateralization

- As human brain matures, certain functions are assigned, or "lateralized," to the left hemisphere of the brain.
- Language functions appear to be controlled mainly in the left hemisphere
- A stroke or accident victim who suffers a lesion in the left hemisphere will manifest some language impairment
- Lateralization is a slow process that begins around the age of 2 and is completed around puberty.
- Plasticity of the brain prior to puberty enables children to acquire not only their first language but also a second language(Scovel ,1969).
- There is a critical period not only for first language acquisition but also, by extension, for second language acquisition.

Neurobiological Considerations Hemispheric Lateralization

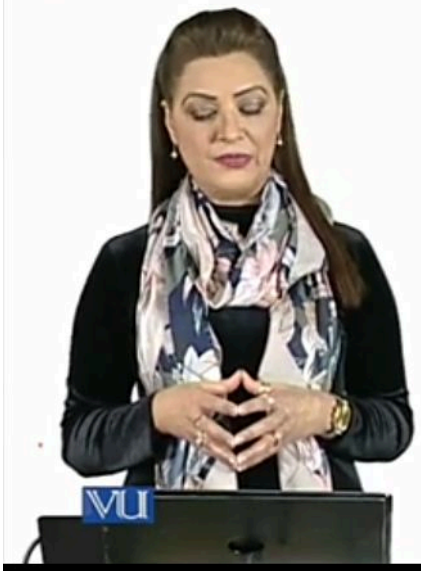

To conclude, the understanding of Neurobiological considerations requires the ability to distinguish between emergence' of lateralization (at birth, but quite evident at five) and completion'(only evident at about puberty) in the process of language acquisition.

Psycholinguistics

Interference Between First and Second Languages

Interference Between L1 & L2 Languages

One of the most important aspects of human development is language acquisition. First language has an effect on the second language acquisition, and it is claimed that L1 can interfere with the acquisition of L2. The role of L1 in the L2 depends on some similarities and differences between the two languages.

Interference Between L1 & L2 Languages

- Learners of second language tend to rely on their first language structures.

Developmental errors, Ambiguous errors,Unique errors

- Learners of second language tend to transfer the forms, meaning and culture of their l1 to the foreign language.
- In positive transfer, l1 facilitates the acquisition of second language, but in negative transfer the first language has negative impacts on l2 and interferes in l1.
- Transfer is a mental and communicative process
- Two parts for SLA suggested by Lennerberg (1967).
- In L2 writing, transfer can be considered both as a learning device and as a strategy to solve communication problems

VU

Interference Between L1 & L2 Languages

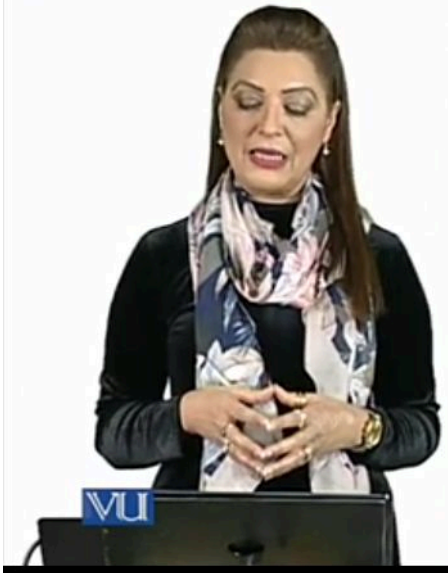

- Learners of second language tend to rely on their first language structures.

Developmental errors, Ambiguous errors,Unique errors

- Learners of second language tend to transfer the forms, meaning and culture of their l1 to the foreign language.
- In positive transfer, l1 facilitates the acquisition of second language, but in negative transfer the first language has negative impacts on l2 and interferes in l1.
- Transfer is a mental and communicative process
- Two parts for SLA suggested by Lennerberg (1967).
- In L2 writing, transfer can be considered both as a learning device and as a strategy to solve communication problems

VU

Interference Between L1 & L2 Languages

So, First language has an effect on the second language acquisition. Further, interference can be positive or negative depend on similarities and differences between two languages .

Psycholinguistics

Anthropological
Evidence
Cognitive
Considerations

Anthropological Evidence Cognitive Considerations

Some adults have been known to acquire an authentic accent in a second language after the age of puberty, but such individuals are few.

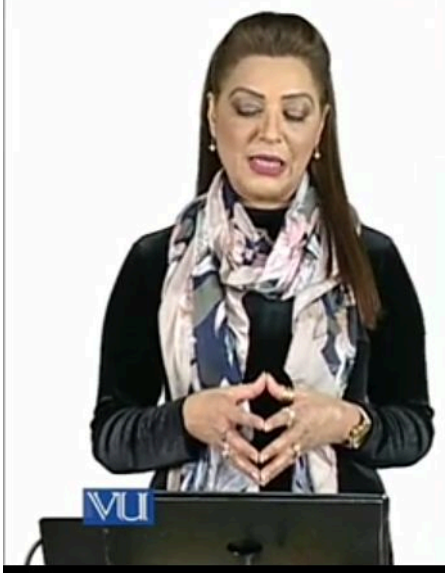

Anthropological research on non-Western societies that yielded evidence that adults can, in the normal course of their lives, acquire second languages perfectly.

Anthropological Evidence Cognitive Considerations

- Performance during adolescence. ✓ Solomon (1967).
- No native-speaker like pronunciation beyond puberty.
- Various stages of intellectual development in a child:
  - Sensorimotor stage (birth to 2)
  - Preoperational stage (ages 2 to 7)
  - Operational stage (ages 7 to 16)
  - • Concrete operational stage (ages 7 to 11)
  - * Formal operational stage (ages 11 to 16)
- Adults learning a second language
- Young children process: Lack awareness of language, societal values and attitudes.
- Successful language learners performance.
- Equilibration : progressive interior organization of knowledge in a stepwise fashion

VU

Anthropological Evidence Cognitive Considerations

Hence, anthropological research claim that adult learners can perfectly acquire second language after the age of puberty.

Psycholinguistics

Issues in First Language Acquisition Revisited

Issues in First Language Acquisition Revisited

- **Issue One:Chomsky's innate theory:** Covers aspects of some other theories, possesses the properties of scientific theory.
- **Issue Two: Child's logical thinking:** Piaget supports the child's logical thinking which is attributable to his third stage of development called "concerned operational period"
- **Issue three: The origins of language:** Chomsky argues that the ability to acquire language is innate. Vygotsky argues that speech is primarily, social in nature, but at first undifferentiated from a functional point of view.
- **Issue Four : Similar terms used differently by Piaget and Vygotsky:** Language development, Egocentric speech, Language & thought, Social interaction, context- dependency & Language Acquisition.

VU

Order of Acquisition

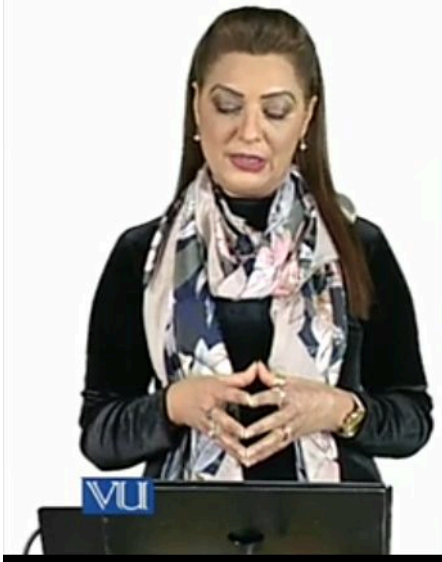

The order of acquisition is a concept in language acquisition describing the specific order in which all language learners acquire the grammatical features of their first language.

Order of Acquisition

- All children acquire their first language in a fixed, universal order, regardless of the specific grammatical structure of the language they learn.
- SLA learners begin their learning process with a silent period in which the learners begin to process pieces of the language they hear.
- Fewer learners have no silent period and pass directly into patterned speech.
- Consistent order of morpheme acquisition for selected morphemes.
- Sequence of acquisition of pronouns by learners of various Indo-European language-omission of pronouns.

VU

Order of Acquisition

Although there were remarkable similarities in the order in which all learners learned second-language grammar, there were still some differences among individuals and among learners with different first languages.
