ENG512 SHORT MID TERM NOTES

1. What is bilingualism?

Bilingualism refers to the state of a linguistic community in which two languages are in contact with the result that two codes can be used in the same interaction and that a number of individuals are bilingual (societal bilingualism).

Titone (1972) says bilingualism is the individual's capacity to speak a second language while following the concepts and structures of that language rather than paraphrasing his or her mother tongue.

2. What is Bilinguality?

Bilinguality is the psychological state of an individual who has access to more than one linguistic code as a means of social communication. The degree of access will vary along with a number of dimensions which are psychological, cognitive, psycholinguistic, social psychological, social, sociological, sociolinguistic, sociocultural and linguistic.

3. What are the contradictions (conflict, disagreement) within the definitions of bilingualism?

Definitions of bilingualism range from a native-like competence in two languages to a minimal proficiency in a second language and raise a number of theoretical and methodological difficulties. Between these two extremes one encounters a whole array of definitions as,

Titone (1972) says bilingualism is the individual's capacity to speak a second language while following the concepts and structures of that language rather than paraphrasing his or her mother tongue.

They lack precision to be operationalized, while they also do not specify what is meant by native-like competence, which varies considerably within a monolingual population. These definitions also refer to a single dimension of bilinguality, namely the level of proficiency in both languages, thus ignoring non-linguistic dimensions.

4. What are the functions of language?

Language, in the first place is a tool which is developed and used to serve a number of functions, both social and psychological, which can be classified in two main categories: communicative functions and cognitive functions. Functions of language are universal but the linguistic forms vary across languages and cultures.

5. Define the levels of language processing?

There are at least two levels of language processing:

Functional level: the functional level, where all the meanings and intentions to be expressed are represented; and

the formal level, at which all the surface forms used in the language are represented.

6. Write a note on language Behavior and society relationship.

Although the study of language can be conducted at several levels of analysis, the nature of language behavior like that of other complex human behaviors, remains the same regardless of the level of analysis across the following:
(1) There is a constant interaction between the dynamics of language behavior at the societal level and language behavior at the individual level.
(2) There is a constant and complex mapping process between the form of language behavior and the function it is meant to fulfil.

(3) Language behavior is the product of culture and as such it follows the rules of acculturated behavior.
(4) Self-regulation is a characteristic of all higher-order behaviors and therefore of language behavior. By this we mean that a behavior is not a mere response to stimuli but that it takes into account past experiences; furthermore, it does not follow a pattern of trial and error but is an evaluative response calling upon the individual's cognitive and emotional functioning adapted to a given situation.
(5) Finally, one concept central to this dynamic interaction between the societal level and the individual level is valorization. By valorization we mean the attribution of certain positive values to language as a functional tool, which will facilitate the fulfilment of communicative and cognitive functioning at all societal and individual levels.

In addition, when two languages are in contact there can be a state of equilibrium between the two languages in which case the use of both languages is constant and predictable. This equilibrium is not unlike the one existing in ecological systems. Any change of the relation between the two languages, due to a change in form—function mapping or to a change in valorization at any level, will provoke a change in language behavior of individuals.

7. How language behavior was changed by literacy?

Introducing an individual to the language used in literacy, mainly through the means of learning to read and write, will induce changes in his or her language behavior. For example, processing a written text calls to a greater extent on the use of decontextualized language. When few people were literate, the behavior of individuals was changed with little effect on the social structures. As more and more people become literate, linguistic forms are mapped onto new cognitive functions; when a critical mass is reached, a need for new social institutions such as schools (form) are created. In turn, these institutions serve the function of literacy; as the need to fulfill this function continues to grow, new norms, which evolve into a recognized fundamental right for education (form), are created. This, in turn, shapes individual behavior: when schooling becomes compulsory, all individuals in a given society are expected to master reading and writing, thus shaping their own individual behavior.

8. Describe relation between linguistic form and function.

The two-level mapping between function and linguistic form is based on the assumption that linguistic forms are developed to express meanings and communicative intentions. As language develops, form—function mapping is not necessarily a one-to-one correlation: a single form can be mapped onto different functions, e.g. *it's cold in here* might have a referential function, meaning *the temperature is low*, or an instrumental-regulatory function meaning *turn on the radiator*. Conversely a single function may be served by several linguistic forms: an order can be expressed by an imperative, an interrogative, etc.

9. How a Language change?

Language is never static but changes over time. Pidginsation is an example in this regard which is developed for the purpose of minimal communication between individuals/ groups speaking mutually unintelligible vernaculars. In the pidginisation process, limited and simplified linguistic forms are developed. As the

need for communication or function increases in the society, new forms are created by the speakers. Gradually these new forms serve extended functions until pidgin evolves into a creole (form) as it becomes the mother tongue of the next generation, and thereby serves new functions.

10. What are the reasons for language change?

The forms of language undergo constant changes due to social changes, emergence of new technologies and contact with other languages. New forms apply to old functions, as when a new expression is used by teenagers; in the same way old forms apply to new functions, as for example; the English word *save* in using a computer; or new forms can be developed for new functions (e.g. new terminology).

11. What is language Valorization?

Language valorization is a process in which one language is preferred more in multilingual context than any other language in society.

Certain functions are valorized more than others, e.g. the cognitive function in school. If different varieties of language, e.g. accents, are present in the society, one variety may be valued to the detriment of others. A similar situation happens in the case of multilingual societies. One or more languages will be highly valued, while others will be devalorized.

12. How we analyze language behavior?

To sum up language behavior, we will focus on different societal and individual levels: societal (institutions, groups and social classes), social networks and interpersonal relations, individual (developmental, socio-affective, cognitive and neuropsychological processes as well as language behavior). At each of these levels, language behavior is dynamic: there are constant interactions amongst the determining factors within and between the different levels.

13. What are the development aspects of language Behavior According to Pinker(1996)?

Modeling of language behavior has been developed more at individual level than at societal level. Generally these models are rooted in a larger framework of

psychological theorizing. According to Pinker (1996), a comprehensive theory of language acquisition must consider the following aspects:

- the state of the child at the onset of acquisition;
- the linguistic input and its context;
- the mental algorithms that turn this input into knowledge about the language;
- the end state of the process, i.e. a grammatically competent speaker,
- and the evolution of the process, i.e. what children understand and produce during the acquisition process.

Linguistic and psychological approaches to language acquisition differ in the emphasis they put on to and the relative importance they attribute to each of these aspects.

14. How a child develops a language according to Burner?

According to Bruner (1975a), before developing language the child learns some communicative functions through cooperative actions, which are arrived at through joint attention with the adults who are interacting with the child. The child is initially equipped with ‘a set of predispositions to construe the social world and to act upon our construal (Bruner,1990). Through interactions with other she will develop a pre-linguistic readiness for meaning, i.e. context sensitivity and a sense of functions before linguistic forms are accessed.

15. Write a note on monolingual situation.

Even in monolingual situation, in addition to its communicative and cognitive functions, language has a social function. By this we mean that any utterance carries a social meaning in that, it reflects the position of its speaker in the power relations in the society which confers a particular social value to this utterance. It can be said that the whole social structure is present in every language interaction and that every interaction is mapped onto the social structure.
Languages and varieties of language (accents, dialects, sociolects, and codes) have a recognized value on the linguistic market (Bourdieu, 1982) and can be placed on a hierarchical scale. Variations in discourse (i.e. in language behavior) are a result of the interplay between the objective dynamic forces of the market and the way in which the individual perceives, evaluates and responds to these forces.
Different language varieties and their values are learned in particular markets. The structures of social networks influence the individual’s language behaviour and

group solidarity can lead to the maintenance of local, non-standard norms, and resistance to linguistic change; whereas a loose and simplex network can lead to change in language (Milroy, 1980).

16. Define Bilingual situation.

When two or more languages are in contact, their relative functional use and relative valorization is very important. A state of functional equilibrium may also exist. In the case of diglossia, different use of each language is determined at the societal level. In that case we have a predictable form—function mapping. However, if the equilibrium is disrupted at one level, it will disrupt the equilibrium at all other levels. A change in the relative use of the two languages in the social networks, e.g. when the individual has a new network because of a job change, will inevitably provoke a change in the language behaviour of the individual. A change in the use of two languages at the societal level, for example, introducing a compulsory language of schooling, will bring about a change in the use of language in the social network, hence in the interpersonal interactions and the language behaviour of the individual. When enough individuals start changing their language behaviour (e.g. using French instead of English), this will in turn modify language use.

17. What is language shift?

Language shift is defined as the change from the use of one language to the use of another language across generations; language attrition is a shift occurring within one individual. In both cases, it refers to the loss of functions, forms and language skills. The shift is complete when parents of one generation cease to transmit their language to their children and when the latter are no longer motivated to acquire an active competence in that language.

18. What is language attrition?

Language attrition is a shift of language occurring within one individual.

19. What principles language behavior is based?

Language behaviour is based on the following five principles:
(1) There is a constant interaction between the societal and the individual dynamics of language.

(2) There are complex mapping processes between the form of language behaviour and the functions it serves.

(3) There is a reciprocal interaction between culture and language.

(4) Self-regulation characterizes all higher-order behaviours, and therefore language.

(5) Valorization is central to these dynamic interactions.

20. What is relative competence?

Competence in one language relation to other language is called relative competence either in Balanced bilinguality or Dominant bilinguality.

21. What is Balanced bilinguality?

Balanced bilinguality is the equal proficiency in both languages.

22. What is Dominant bilinguality?

A state in which an individual has higher proficiency in one language than other.

23. Write down the age of acquisition of language behavior?

- childhood (before the age of 11);
- adolescence (11-17 yrs),
- adult (after 17 yrs)

24. What is Endogenous bilinguality?

Endogenous bilinguality is the presence of both languages in the community environment.

25. What is Exogenous bilinguality?

Exogenous bilinguality is the absence of the second language in the community. Some members of the community speak a second language that has no or few native speakers in the community.

26. What is additive bilinguality?

In additive bilinguality, both languages are encouraged equally and equal status is given to the all languages in a society.

27. What is subtractive bilingualism?

In Subtractive bilingualism, one language is encouraged at the expense of the other, leading to cognitive disadvantage.

28. What is Bicultural bilinguality?

Bicultural identity is the condition of being oneself regarding the combination of two cultures.

29. What is Mono cultural bilinguality?

Mono cultural identity is the condition of being oneself regarding the member of one culture.

30. What is Acculturated bilinguality?

Acculturation is the process of changing so that you become more like people from a different culture, or of making someone change in this way to follow both cultures. While being Acculturated bilinguality mean speaking both language with adopting cultures as well. Example: PM IMRAN Khan is the example of acculturated bilinguality.

31. What is deculturated bilinguality?

Deculturated bilinguality: ambiguous membership and anomic identity. (Anomic is one who fail to identify himself being a member of clture).

32. What is language contact?

It is inevitable perhaps that an enormous amount of ‘language contact’ takes place when we speak of ‘language contact’; we are therefore talking about people speaking different languages coming into contact.

33. Describe Societal Bilingualism.

Sociolinguists have shown how monolingual behaviour varies according to a number of parameters such as, e.g. role relation, relative status of speakers and languages, topics, domains, etc. which apply to language-contact situations and that the state of bilinguality interacts with these.
The bilingual community is either composed of two groups speaking two different languages as their mother tongue along with a small number of bilinguals speaking both languages, or a small number of both groups speaking a third common language, used as a lingua franca; or, as in the case of an exogenous language, some members of the community speak a second language that has no or few native speakers in the community. Any of these languages may be an official language of the community. Every bilingual community is situated between the two poles of a continuum, ranging from a set made up of two unilingual groups each containing a small number of bilinguals to a single group with a more or less large number of members using a second language for specific purposes.

34. What is Territorial bilingualism?

Territorial bilingualism is a situation in which each group finds itself mostly within its own politically defined territory with the two (or more) languages having official status in their own territory; the official status of the other national language(s) varies considerably from country to country. Examples of territorial bilingualism include Belgium, Canada and India.

35. Describe the term Diglossic?

A bilingual community can be described as diglossic, that is, two languages are spoken by a variable section of the population, but they are used in a complementary way in the community, one language or variety having a higher status than the other and being reserved for certain functions and domains.

36. Describe comparative measurement of Bilinguality.

The most frequently used technique for measuring the various dimensions of bilinguality consists in taking measures in each of the bilingual's two languages and comparing them. However, a direct comparison between measures in two languages is extremely difficult even when it is possible because we need a clear

definition of what a native speaker's competence in that language is, which is very difficult to operationalize.

37. What is the distinction between compound and coordinate bilingual?

The distinction between the compound and coordinate bilingual is one of semantic representations; it implies that for the coordinate bilingual, there is a greater semantic independence between his two linguistic codes, while for the compound there is greater semantic interdependence between the two codes. How can the degree of semantic independence and interdependence be measured? This is through language biographies, self-evaluation and judgments of bilingual production.

38. What are the measures of Bilingual specificity?

Translation and verbal flexibility are only measures in which the bilingual's behaviour is viewed as the sum of two monolingual behaviours. A bilingual also develops patterns of behaviour that are unique to his state of bilinguality (Grosjean, 1985a). For example, when bilinguals communicate with each other they can make simultaneous use of the resources of each of their languages, for example by borrowing words from one language while using the other (loan words) or by developing mixed or switched codes which are governed by their own specific rules. There is an attempt to correlate the degree of balance of bilinguals with a high level of competence in rule-governed code-switching.

39. What are the **Measures of Cognitive Correlates of Bilinguality?**

A considerable amount of empirical evidence suggests that a correlation between the development of bilinguality and cognition exists. The results of these studies are apparently contradictory insofar as they show either a cognitive advantage or a cognitive disadvantage of bilingual development as compared to monolingual development because the concepts of cognitive advantage and disadvantage are defined by reference to monolinguals.

40. What are the measures of Affective Correlates of Bilinguality?

There is always a cognitive and an affective aspect to development. The affective component of bilingual development has to do with the relationships between the

bilingual individual and his two languages. Since language is a social phenomenon, all affective reactions towards it are not limited to the language but applies also to the individuals and groups who speak that language.

41. What is the measurement of Bilinguality in cultural Minorities?

The measures of bilinguality previously mentioned are not applicable to all situations of languages in contact; and in particular, there are difficulties when we try to use them in a cultural-minority situation. This is especially critical in the case of the education of cultural-minority children because they follow curricula in the language of the majority, which is usually their weaker language Cummins (1984a), psychometric tests of academic language proficiency are not appropriate for the assessment of minority children because these children have not reached the level of development required for these tests.

42. Define language contact situation.

Language contact situations arise when speakers of different languages are put in a position that they need to interact with each other. There are several reasons for language contact. These reasons can be individual and voluntary, structural and non-voluntary i.e. where there is little individual choice for language use. For example, in a migrant situation, where everyone has to use the dominant language of the host country, other key factors resulting in language are political factors (for example, new language laws or colonialism, globalization, war or invasion); resettlement of people; religious affiliation; oppression, culture and identity negotiation, economy, education and technology and immigration.

43. What is Bilingual?

The discussion revolves around how much proficiency in two languages is required by an individual to be labeled as a bilingual. A bilingual may be balanced where there is equal proficiency in both languages but this is a rare phenomenon. More often than not individuals have unequal proficiency in different languages across different skills. Usually this individual proficiency is in harmony with different functions associated with different languages.
Any construct of bilingualism incorporates within it a concept of language. This is again problematic because language definitions are also contested. Language is simultaneously, a linguistic, cognitive and social phenomenon.

- The linguistic phenomenon is evident in its structure and its composition of form, the cognitive aspect is related to the mental processes involved in language knowledge,
- while the social dimension is related to issues of power (for example, the difference between language and variety) in society.

44.What is the difference between Language and Dialect?

The differences between dialect and languages are made on the basis of size. Language is believed to be a larger repertoire of linguistic items and subsuming dialects.

The difference between a dialect and language is also explained in terms of their mutual intelligibility i.e. where two languages may not be mutually understood by speakers, the dialect of a language might be mutually understood.

Lastly, a language holds more prestige than a dialect. However, these distinctions are not inherent qualities of a language or a dialect. Dialects may undergo a deliberate process of standardization that expands its vocabulary and its functions to give it a status of language. Language formation is a result of a deliberate decision-making. Several dialects are not mutually intelligible while some languages are mutually intelligible but still considered languages. The example, Urdu and Hindi can be cited here. Hence, the difference between the dialect and language is related to the power and status of its speakers.

44. How dialect becomes a language?

Dialect undergo a deliberate process of standardization that expands its vocabulary and its functions to give it a status of language. Language formation is a result of a deliberate decision-making.

45. Write down the positive and negative aspects of the multilingual society.

Multilingual countries are often thought to have certain problems which monolingual states do not. On the practical level, difficulties in communication are one. It should be pointed out that there is no scientific evidence to show that multilingual countries are particularly disadvantaged, in socio economic terms, compared to monolingual ones. Although, it might be true that linguistic

uniformity and economic development reinforce each other; in other words, economic wellbeing promotes the reduction of linguistic diversity.

46. What are the Economic Advantages of Bilingualism?

There are also potential economic advantages to being bilingual. A person with two languages may have a wider portfolio of jobs available. As economic trade barriers fall, as international relationships become closer, as unions and partnerships across nations become more widespread, an increasing number of jobs are likely to require be a person to be bilingual or multilingual.

47. What are cognitive Advantages of Bilingualism?

More recent research has shown that bilinguals may have some advantages in thinking, ranging from creative thinking to faster progress in early cognitive development and greater sensitivity in communication. For example, bilinguals may have two or more words for each object and idea; sometimes corresponding words in different languages have different connotations.

48. What are the Disadvantages of Bilingualism?

Some problems, both social and individual, may be falsely attributed to bilingualism. For instance, when bilingual children exhibit language or personality problems, bilingualism is sometimes blamed. Problems of social unrest may unfairly be attributed to the presence of two or more languages in a community. However, the real possible disadvantages of bilingualism tend to be temporary. Some bilingual children may find it difficult to cope with the school curriculum in either language for a short period of time. However, these are challenges that bilingual people have to face.

A more complex problem associated with bilingualism is the question of identity of a bilingual. However, it has to be said that for many bilingual people, identity is not a problem. While speaking two languages, they are resolutely identified with one ethnic or cultural group. Some immigrants, for instance, desperately want to lose the identity of their native country and become assimilated and identified with the new home country, while some others want to develop a new identity and feel more comfortable with being culturally hyphenated.

49. What are the four essential characteristics of Bilingualism?

Four essential characteristics of Bilingualism are degree; function; alternation and interference.

50. Define the terms Degree, Alternation and interference.

1. Degree:

The first and most obvious thing to do in describing a person's bilingualism is to determine how bilingual he is for the bilingual may not have an equal mastery of all four basic skills in both languages. It is necessary to test each of these skills separately if we are to get a picture of the extent of his bilingualism.

To get an accurate description of the degree of bilingualism, different types and models of language tests have now been developed.
Functions: The degree of proficiency in each language depends on its function, that is, on the uses to which the bilingual puts the language and the conditions under which he has used it. These may be external or internal.

51. Write down the main source of variance in language behavior.

Variance in language behaviour in multilingual settings is likely to be exceedingly complex. For highlighting patterns of language choice in multilingual settings, it would seem appropriate to distinguish at least between the following sources of variance:
1. Media variance: writing, reading and speaking: Degree of mother tongue maintenance or displacement may be quite different in each of these very different media. Where literacy has been attained *prior* to interaction with an "other tongue" reading and writing use of the mother tongue may resist displacement longer than speaking usage.
2. Role variance: Degree of maintenance or shift may be quite different in conjunction with *inner speech* (the language of thought, of talking to one's self,), *comprehension* (decoding, for self), and *production* (encoding, for others).There is some evidence that language shift is most resistant to inner speech.
3. Situational variance: Degree of maintenance or shift may be quite different in conjunction with *more formal, less formal* and *intimate* communication (Fishman, 1965a). Language shift is resisted more in intimate situations.
4. Domain variance: Degree of maintenance or shift may be quite different in each of several distinguishable domains of language behaviour.

52. What are the two steps process of verbal communication and how it is affected?

Verbal communication may be seen as a two-step process.

Step 1: Speakers take in clues from the outside and translate them into appropriate behavioral strategies. This step parallels the perceptual process by which referential meanings are converted into sentences.

Step 2: These behavioral strategies are in turn translated into appropriate verbal symbols.

It has been shown that aside from purely linguistic and stylistic rules, the form of a verbal message in any speech event is directly affected by:
1. The participants, i.e. speakers, addressees, and audiences;

03 Marks Questions

1. Use of language (topic 143)

Studies have shown that the language use of bilinguals responds to their communicative and affective intent, as well as to the situation and the interlocutor. Fishman et al. (1971) proposed the construct of domains as such, domains are "a sphere of activity representing a combination of specific times, settings, and role relationships" (Romaine, 1994: 43). Domains allow scholars to make connections between, on the one hand, clusters of interaction and interlocutors, and on the other, more concrete social situations.

2. Indexicality.

It means reference to or an indication of something. Indexicality is the phenomenon of a sign pointing to some object in the context in which it occurs. For Example: "I" refers to self , "now" refers to "time".

3. Define the term language proficiency.

Language proficiency is the ability of an individual to use language with a level of accuracy which transfers meaning in production and comprehension.

The word “proficient” means a well skilled level. In term of language, the “proficient” label can refer to someone who is very skilled in the use of language.

4. How does domain configuration happen in language variance?

A description and analysis of the simultaneous, cumulative effect of all of the above-mentioned sources of variance in language choice provides a dominance configuration (Weinrich, 1953). Dominance configurations summarize data on the language choice behaviour. Repeated dominance configurations for the same population, studied over time, may be used to represent evidence of language maintenance or shift in a particular multilingual setting. Although the dominance configurations till requires much further refinement, it seems to merit the time and effort that such refinement might necessitate.

5. Name the three ways of language mixing.

- syntactic mixing,
- semantic mixing
- and pragmatic mixing

6. How do pidgin emerge?

Language is never static but changes over time. Pidginsation is an example in this regard which is developed for the purpose of minimal communication between individuals/ groups speaking mutually unintelligible vernaculars. In the pidginisation process, limited and simplified linguistic forms are developed. As the need for communication or function increases in the society, new forms are created by the speakers. Gradually these new forms serve extended functions until pidgin evolves into a creole (form) as it becomes the mother tongue of the next generation, and thereby serves new functions.

7. Make a list of different sources of language variation that have been considered by researchers.

Contacts with each of the above are as may vary in duration, frequency, and pressure. They may also vary in the use of each language for comprehension(C) only, or for both comprehension and expression (E).

Variation in language contact may occur in form of “Duration”, “Frequency”, “Pressure” and due to internal factors. Internal factors are uses and aptitude (sex, age, intelligence, memory, attitude, motivation).

8. What did Voterra and Taeschner argue in Three Stage model?

1. Initial unification of both lexical and syntactic subsystems
2. Differentiation of the lexicon but continued unification of syntax
3. Finally, differentiation of both the lexicon and syntax

9. Define Frequency.

Frequency: The duration of contact is not significant, however, unless we know its frequency. Frequency for the spoken language may be measured in average contact-hours per week or month; for the written language it may be measured in average number of words.

10. Enlist the way of communication in 21st century.

Bilingualism for the twenty-first century must be more than the knowledge of two languages. Abilities such as translation, language switching and designing information bilingually will be increasingly important,
abilities that are supported by the community’s translanguaging. The recursivity and dynamism of
bilingualism today, that is, its adaptive nature to an increasingly socially complex context, demands bilingual skills that are much more than just monolingual skills in two separate contexts. If we focus then not on
separate languages as we have done in the past, but on the bilingual or multilingual discourse practices that we need and that are readily observable in bilingual classrooms, we can see that bilingual arrangements that build on translanguaging are the only way to build the plurilingual abilities that we will need in the future.

11. Inner speech with example:

Inner speech is a form of internalized, self-directed dialogue: talking to oneself in silence. Example:
In our life when we face any problem we use our inner speech or talk internally for its solution.

12. Six areas of language deficit in bilinguals.

1. Size of vocabulary
2. Correctness of language
3. Unconscious processing of language
4. Language creation
5. Mastery of the functions of language
6. Meanings and imagery

13. Metalinguistic skills:

Metalinguistic skills involve the awareness and control of linguistic components of language. Simply put, it implies the ability to think and discuss language. These skills require an awareness of others as listeners and an ability to recognize significant details that indicate changes in speech.
For example, you do not usually speak to a teacher in the same way you would speak to a friend. In addition, you do not typically speak in a restaurant the same way in which you speak in a museum.

14. Metalinguistic Awareness:

With metalinguistic awareness, a person can reflect on the language. They could also understand – with metalinguistic awareness – that not all language is literal. For example, if someone says, "My little dog is an Olympic athlete," it doesn't mean that the dog participates in the Olympic athletic events.

15. Define Regularity in social meaning.

The meaning attached to local descent and dialect use— being part of the "local team"—is clearly seen when we consider those members of the community who dissociate themselves from this "team." Traditionally, in northern Norway the local community of equals was separated from the landowning commercial and administrative elite by a wide gulf of social and judicial inequality. Since the latter were the introducers and users of standard Norwegian, the standard form was—and to some extent still is—associated with this inequality of status. Many of the

functions of the former elite have now been incorporated into the local social system. Individuals who fill these functions, however, continue to be largely of nonlocal descent. Although they may pay lip service to locally accepted rules of etiquette and use the dialect on occasion. Since the different social meanings which attach to the dialect are regular and persistent, they must in some way be reinforced by the pattern of social ties.

16. Define Semantic mixing.

At a time when we use certain words or utterances which are equivalent to usage and utterances in other language. Example:
"Open the light" in French is equal to "Turn on or switch on light" in English.

17. Enlist Factor that affect research

The effects of age, gender and educational background of the researcher on the data that he or she collects and ultimately analyses have been discussed extensively by sociolinguists (e.g. Milroy, 1987). Successful investigation requires the researcher's sensitivity to the context of the study, willingness to overcome difficulties and honesty about his or her identity, attitude and research agenda.

18. Name the key factors and sub factors of language contact.

Resettlement of people; religious affiliation; oppression, culture and identity negotiation, economy, education and technology and immigration.

Past Papers

1. How Multilingualism is helpful at personal and societal level?

Multilingualism is an important resource at both the societal and personal levels. For a linguistically diverse country to maintain the ethnic-group languages alongside the national or official language(s) can prove to be an effective way to motivate individuals while unifying the nation. Additionally, a multiethnic society is arguably a richer, more exciting and stimulating place to live in than a community with only one dominant ethnic group. For the multilingual speaker, the availability of various languages in the community repertoire serves as a useful interactional resource.

2.Semilingualism

The obsession with monolinguals as the norm of reference has led to the proposal of the concept of semilingualism, referring to the unequal performance of bilingual children in their two languages when compared to monolingual children (see Skutnabb-Kangas and Toukomaa, 1976). The development of sociolinguistics has expanded our understandings of the languaging practices of bilinguals; that is, their

discursive practices, and how these in turn are affected by social and political constraints. This increased understanding has led scholars to abandon the concept of semilingualism, no longer considering it a useful characterization.

3.How a bilingual store language in brain?

A frequently asked question is whether a bilingual speaker's brain functions differently from that of a monolingual's brain. Quantitative analyses of the existing data often show that differences between them are the exceptions rather than the rule. Bilinguals do not seem to vary from monolinguals in neurological processes; the lateralization of language in the brains of the two groups of speakers is also similar.
A related issue concerns the mental representation of a bilingual's two languages and the processing emanating from such representation. Evidence exists for both separate storage and shared storage of the two languages in the bilingual's brain, resulting in the suggestion that bilinguals have a language store for each of their two languages and a more general conceptual store. There are strong, direct interconnecting channels between each of these three separate stores. The interconnections between the two languages comprise association and translation systems, and common images in the conceptual store act as mediators.

5.Five principles of bilingual behavior.

Language behaviour is based on the following five principles:
(1) There is a constant interaction between the societal and the individual dynamics of language.

(2) There are complex mapping processes between the form of language behaviour and the functions it

(3) There is a reciprocal interaction between culture and language.

(4) Self-regulation characterizes all higher-order behaviours, and therefore language.

(5) Valorization is central to these dynamic interactions.

6. What is family domain?

In many studies of multilingual behavior, the family domain has proved to be a very crucial one. Multilingualism often begins in the family and depends upon it for encouragement if not for protection. Many investigators, have also differentiated within the family domain in terms of "speakers." However, two different approaches have been followed in connection with such differentiation. Braunshausen and also Mackey (1962) have merely specified family "members": father, mother, child, domestic, governess and tutor, etc. Gross(1951), on the other hand, has specified dyads within the family: grandfather to grandmother, grandmother to grandfather, grand-father to father, grandmother to father, grand-father to mother, grand-mother to mother, grandfather to child, grandmother to child, father to mother, mother to father, etc. The difference between these two approaches is quite considerable. Not only does the second approach recognize that interacting members of a family (as well as the participants in most other domains of language behaviour) are hearers as well as speakers (i.e. there may be a distinction between multilingual comprehension and multilingual production), but it also recognizes that their language behaviour may be more than merely a matter of individual preference or facility but also a matter of role-relation.

7. Fishman Stability…

According to Fishman, relative stability can be maintained as long as societal compartmentalization of language lasts. When two languages compete for use in the same situations, as in the case of bilingualism without diglossia, language shift, a process in which a speech community collectively gives up a language in favour of some other, may occur.
Fishman (1968) argues that "The study of language maintenance and language shift is concerned with the relationship between change (or stability) in language usage patterns on the one hand, and ongoing psychological, social or cultural processes, on the other hand, in populations that utilize more than one speech variety for intra-group or for inter-group purposes."

8. Transformative..

Bilingual education has the potential of being a transformative school practice, able to educate all children in ways that stimulate and expand their intellect and imagination, as they gain ways of expression and access different ways of being in the world. By using a language effectively, one can access information extend social networks and build self-worth.

9. Earlier languages of European commission…

The European Commission introduced Erasmus, an exchange program that encourages university students from different European countries to study for part of their degree in a different language
in another country. This has now been extended to other parts of the globe under the name Erasmus-World.
Tribal Colleges that are fully accredited and operated by American Indian tribes in the United States offer Native American language and culture courses.

10. Dialects

For linguists, the term "dialect" is a neutral term used for variants of a specific language. Romaine (1994) defines dialect as "a subordinate variety of a language," and refers to regional dialects, associated with a place, social dialects, associated with social class, and historical dialects referring to ancestors of present language varieties. There are also ethnic dialects spoken by ethnolinguistic groups.
Many lay people also assume that dialects are varieties of a language that are mutually intelligible, that is, speakers are able to understand each other. However, mutual intelligibility has little to do with language, and more to do with people, since it is people who understand each other.
