Q.1 There are two types of quality attributes i.e. those that are measured at run time, and those _____.

A. That can only be estimated through unit testing
B. That can only be estimated through requirements
C. That can only be estimated through inspections
D. That cannot be estimated

Q.2 The architecture should be documented using views which means it should have _____ documentation at the initial stage.

A. Overall
B. Maximum
C. Too much
D. Minimal

Q.3 Class Diagrams kind of module structure emerges as an output of _____ analysis and design.

A. Sequence
B. Data flow
C. Data-structure
D. Object-oriented

Q.4 _____ is an abstraction of a system that selects certain details and suppresses others.

A. Software implementation
B. Software architecture
C. Software complete code
D. Software code

Q.5 _____is a collection of principles that shapes the design of your application they may overlap and can be used in combination.

A. Architecture Component
B. Application types
C. Architecture styles
D. Architecture frame

Q.6 Select the most suited application type for a scenario where you want to support data entry with forms in an occasionally connected scenario.

A. Service applications
B. Mobile applications
C. Rich Internet applications
D. Rich client applications

Q.7 Which of the following represent key areas of application design that are not relate to specific layer of application?

A. Cross cutting concerns
B. Duplicate design abstraction
C. Encapsulation
D. Architecture frame

Q.8 A three-tier layered service-oriented architecture may be the right thing for a _____but completely wrong for an _____.

A. Large enterprise's web-based B2B system, Avionics application

B. Avionics application, small enterprise's web-based B2B system

C. Small enterprise, Avionics application

D. Avionics application, Large enterprise's web-based B2B system

---

Q.9 Depending on your requirements, you _____ consider every quality attribute.

A. Need to

B. Might or might not

C. Should always

D. Should never

Q.10 Client/server, component-based, layered architecture, message-bus, Separated Presentation, 3-tier/N-tier, object-oriented, and service-oriented architecture (SOA) are the examples of _____.

A. Rich Client Applications

B. Rich Internet Application

C. Architectural styles

D. Web Applications
