Q.1 In a distributed memory architecture, each processor has its own _____.

A. local memory

B. global memory

C. direct access memory

D. random access memory

Q.2 _____ is a type of memory architecture that allows multiple processors or threads to access the same memory space.

A. Random Access memory

B. Shared memory

C. Read only memory

D. Direct memory access

Q.3 What is the conventional architecture made up of?

A. Processor and data-path

B. Processor and memory system

C. Processor, memory system, and data-path

D. Memory system and data-path

Q.4 In distributed computing, computers communicate with each other through_____ .

A. control unit

B. direct memory access (DMA)

C. message passing

D. bus

Q.5 Execution of series of programs on a computer without manual intervention is the specific characteristic of _____.

A. Batch Era

B. Network Era

C. Desktop Era

D. Time Sharing Era

Q.6 _____ architecture is a type of parallel computing architecture where multiple processing units execute different instructions on the same data element simultaneously.

A. Single Instruction Multiple Data (SIMD)

B. Multiple Instruction Multiple Data (MIMD)

C. Multiple Instruction Single Data (MISD)

D. Single Instruction Single Data (SISD)

Q.7 What is a GPU?

A. A central processing unit

B. A general processing unit

C. A type of input device

D. A graphics processing unit

Q.8 _____ architectures require only a single copy of the program to be loaded into memory.

A. Single Instruction Multiple Data (SIMD)

B. Multiple Instruction Multiple Data (MIMD)

C. Multiple Instruction Single Data (MISD)

D. Single Instruction Single Data (SISD)

Q.9 Flynn's classification of computer architectures in parallel and distributed computing was proposed by _____.

A. David A. Huffman

B. Jean Bartik

C. John Von Neumann

D. Michael J. Flynn

Q.10 Parallel processors collectively have large and fast_____.

A. cooling system

B. clock speed

C. Instruction sets

D. cache

VU TOOLKIT
