Q.1 In distributed computing, computers communicate with each other through_____ .

A. message passing

B. bus

C. control unit

D. direct memory access (DMA)

Q.2 Flynn's classification of computer architectures in parallel and distributed computing was proposed by _____.

A. Michael J. Flynn

B. Jean Bartik

C. David A. Huffman

D. John Von Neumann

Q.3 _____ is a type of memory architecture that allows multiple processors or threads to access the same memory space.

A. Random Access memory

B. Shared memory

C. Read only memory

D. Direct memory access

Q.4 _____ architectures require only a single copy of the program to be loaded into memory.

A. Multiple Instruction Single Data (MISD)

B. Multiple Instruction Multiple Data (MIMD)

C. Single Instruction Multiple Data (SIMD)

D. Single Instruction Single Data (SISD)

Q.5 _____ architecture is a type of parallel computing architecture where multiple processing units execute different instructions on the same data element simultaneously.

A. Single Instruction Single Data (SISD)

B. Single Instruction Multiple Data (SIMD)

C. Multiple Instruction Multiple Data (MIMD)

D. Multiple Instruction Single Data (MISD)

Q.6 In a distributed memory architecture, each processor has its own _____.

A. direct access memory

B. global memory

C. random access memory

D. local memory

Q.7 _____ is the measure of a system's ability to increase or decrease in performance and cost in response to changes in application and system processing demands.

A. Scalability

B. Caching

C. Multithreading

D. Deadlock

Q.8 Parallel processors collectively have large and fast_____.

A. cache

B. cooling system

C. Instruction sets

D. clock speed

VU TOOLKIT
