

Lesson No. 1

DEFINITION AND CONCEPT OF LANGUAGE

Topic 001What is Language?

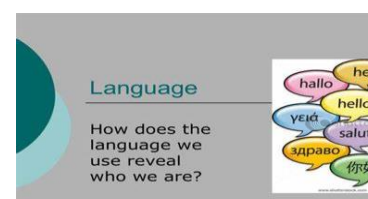

Language is a complex and multi-layered phenomenon, deep-rooted in human culture and cognition. It serves as an initial tool for communication and expression. It is a basic tool for communicating your feelings, feelings, emotions, and emotions when two people communicate and express their feelings and thoughts to each other.

Transmission of knowledge across generations. There are various definitions of language, each shedding light on different aspects of this involved human capability, which is defined by different experts in different languages that relate to different capacities of human abilities. Language is often defined as a communication tool that enables individuals to convey thoughts, emotions, and information through spoken or written words, gestures, and other symbols.

Aspects of Language Development:

1. **Rule-Governed System:** Another perspective views language as a rule-governed system with syntax, morphology, and semantics that dictate how words and symbols are structured and combined. Also, it tells us how words and symbols combine.
2. **Cultural Expression:** Language and culture are closely related. According to Vygotsky, Language is the main source of communicating culture. Culture is human life. So, Language is a cultural expression, reflecting the values, beliefs, and traditions of a society. Further, it is a powerful medium for preserving and transmitting or transferring cultural heritage.
3. **Cognitive Capacity:** It is another important perceptive. There is a great linkage and association between the psychological aspects of human beings and language. So, some definitions emphasize language as a unique cognitive capacity, distinguishing humans from other species. This view explores the neurological and

psychological aspects of language. So, it is a means of expression of all these nerves and human physiological psychology and physiology.

4. **Social Interaction:** Language is a tool for social interaction, individuals particularly children establish and maintain relationships, and negotiate meaning. Also, engage them in collaborative activities.
5. **Generative Ability:** Language is a generative ability, allowing speakers to create an infinite number of novel sentences to convey new ideas.

Topic 002

How Language is Developed?

Language development typically begins during infancy, with babies starting to recognize and differentiate sounds and speech patterns. Some stages are as follows.

Stages of Language Development:

Stage 1 Sounds (Baby Language Milestone):- It starts from birth. They try to recognize their voice from sound e.g., cry and laugh, etc. Infants can recognize stress, pace, and the rise and fall of pitch during the first three months.

- **4 months:** Infants can distinguish between language sounds and other noises.
- **6 months:** Babies are now capable of making and uttering all the sounds.

Stage 2 (Words):- At the age of 6 and 7 months, children learn how the sounds in a language go together to make meanings.

- **8 months:** Babies can now recognize a group of sounds and can distinguish word boundaries, and they recognize these sound groups as words.
- **12 months:** Children can attach meanings to words by mimicking or imitating new words they hear.
- **18 months:** Children must know the words they are learning to communicate. They can communicate their hunger to their mothers through crying. In this stage of language development, children also recognize the difference between nouns and verbs.

Stage 3 (Sentences):- During this stage, children learn how to make sentences. That means they can put words (e.g., one word, two words, or three words) in the correct order and make sentences. For example, they learn that we say, “I want a cookie”.

- **24 months:** They can use pronouns, and they also know the right order of words in a sentence and can create simple sentences like “Me cookie?”

- **30-36 months:** About 90% of children's sentences are grammatically correct by this age.
- **Beyond 3 years:** As they grow, children continue to expand their vocabulary and develop more complex language.

Topic 003

Importance and Need of Language:-

Language is particularly important for children, as it plays a critical role in their development and success in many aspects of life.

Importance of Language: Communication is the most integral part of human nature having a compulsive urge to communicate with each other as more than 70% of other time is spent communicating with others. Therefore, Language is the most important way of interaction and in which we communicate to others through words, sounds, and sentences. Of all the creatures, man has the ability and power to express himself in words or language. The use of language differentiates human beings from birds and animals. A man who is fluent in several languages will be able to improve his personality and brain function. Learning a foreign language allows you to experience the world from a different perspective. “You are as many people as the languages you speak”. Furthermore, A person who speaks two or three languages is as useful as a person who speaks two or three languages. Language skills boost your ability to negotiate, convince others, and do problem-solving tasks as well. Hence, it is a necessity for humans.

Languages are divided into two types:

- Verbal
- Non-Verbal.

Need of Language: Language is important for:

- Communication
- Storing information in mind (Information processing model)
- Sharing concepts and associated knowledge
- Provide identity.
- Developing collective skills
- Describing mental states

Topic 004**Elaborate the Theories of Language Development:-**

Language development in children is a complex process that has been studied from various theoretical perspectives. A theory presents the phenomena that researchers have developed through grounded theories. Below are some of the key theories of language development, along with their main principles and supporting research.

- 1- **Behavioral Learning Theory:** B.F. Skinner is one of the major proponents of this theory. According to him, language development is shaped through operant conditioning and the use of reinforcement or rewards. A behavior becomes permanent when it receives reinforcement. Action may also vanish if reinforcements vanish.
- 2- **Social Cognitive Learning Theory:** According to Bandura, children learn language by imitating the speech they hear from others. research has shown that the more mothers respond to their babies' vocalizations, the sooner their babies develop language.
- 3- **Nativism Theory:** The nativist theory was proposed by Noam Chomsky in 1968. He is an American linguistic. He suggests that language development is innate and biologically determined. Chomsky proposed the concept of a Language Acquisition Device (LAD), which he believed was a biological mechanism that enabled children to learn language. According to this theory, children are born with an innate ability to learn language and universal grammar, and their environment provides the input that triggers language acquisition. Furthermore, Chomsky believes that the basic principles of grammar are innate. Clearly, we do not all speak the same language and the rules for grammar are not the same in all languages.
- 4- **Interactionism Theory:** Interactionists argue that language development is both biological and social interaction. They contend or refuse that language learning is affected by the desire of children to communicate with others. Inter-actionists are of the view that we learn language through our interaction with others and they view language development in a social context.
- 5- **Cognitive Processing Theory:** The cognitive theory suggests that language development is closely linked to cognitive development. It has generated concerns and objections about social interaction and biological readiness. This theory believes that learning a language is a process of "data crunching" in which children take in and process the language they hear (or in which the actual process of

learning words and their meanings relies on the computational ability of the human brain).

Topic 005

Components of Language:-

The development of language in children involves the acquisition of several components that make up a complex system of communication. The components of Language belong to the branch of micro linguistics. As, the term micro deals with the smallest level of information and data. Below are some of the main components of language development in children:

1. **Phoneme:** A phoneme is a basic unit of phonology. It is a study of sounds. There are 26 alphabets and 44 phonemes in the English language. The phonemes are further divided into two categories: Consonants and Vowels. So, there are 24 constant sounds and 20 vowel sounds.
2. **Phonology:** Generally, it focuses on the study of the system of phonemes in a language. It refers to the sounds that make up language and the rules that govern how those sounds can be combined to form words. As children learn a language, they must learn to distinguish between different sounds, and then learn how those sounds are combined to form meaningful words.
3. **Morphology:** It is related to vocabulary development and reflects the smallest building blocks for comprehension. As there is no language without words. If it does, it is referred to be sign language. Therefore, morphology refers to the smallest units of meaning in a language, known as morphemes. Children must learn how morphemes are combined to form words and how those words can be modified to convey different meanings.
4. **Syntax:** Syntax refers to the rules that govern how words can be combined to form phrases and sentences. Children must learn how to order words correctly in a sentence and how to use grammatical markers to convey different meanings.
5. **Semantics:** Semantics deals with the Grammatical structure of language to help us understand it. Children must learn the meanings of words and how those words can be combined to convey different messages.
6. **Pragmatics:** Pragmatics refers to the social and cultural rules of language use. Children must learn how to use language appropriately in different contexts and

how to adapt their language use to different social situations. For example, Children learn language from their parents and siblings at home, and their teachers and friends at school.

Lesson No: 2**COMPONENTS OF LANGUAGE****Topic 006****Phoneme:-**

A phoneme is a part of phonology and phonology deals with the study of sounds. A phoneme is the smallest and most basic unit of sound that can be used to distinguish one word from another in a language. It may also cause a change of meaning and sounds within a language. It doesn't have meaning by itself. Phonemes match up to the sounds of the alphabet, although there is not always a one-to-one connection between a letter and a phoneme. Additionally, the alteration of a phoneme might alter meaning.

For examples,

- The word "hat" has three phonemes /h/ , /a/ , /t/.
- In English, the sounds /p/ and /b/ are phonemes because they can be used to distinguish words like "pat" and "bat". These are consonants and vowel sounds.
- The word "shape" has five letters, but it has only three phonemes /sh/ , /long-a/ , /p/. So, a number of letters and phonemes can be changed, and it depends on the word.
- Both the sounds and the meanings of the words "pen" and "pin" are distinct.

The English language has around 45 different phonemes, which are associated to letters or combinations of words. A phoneme can have a specific pronunciation in one word and a different pronunciation in another word e.g. sounds in both words pen and pin. Phonemes are important for language development because they allow children to distinguish and produce different sounds in language. Children begin to develop an understanding of phonemes at a young age, with the ability to distinguish between different phonemes developing during the first year of life. As children's language abilities continue to develop, they become more proficient at producing and combining different phonemes to form words and sentences.

Topic 007**Phonology: -**

Phonology is the study of the sound patterns in a language. It is the branch of language, which is concerned with the orderly organization of sounds in language. It involves the analysis of the individual speech sounds, known as phonemes, and the rules

that govern how those sounds can be combined to form meaningful words. So, the smallest unit of sound to formulate the language is called the phoneme.

Phonology is an important component of language development because children must learn to distinguish between different sounds and understand how those sounds are used in their native language. As 26 alphabets have a total of 44 phonemes or sounds. Although all of these sounds are related to the alphabet, not all sounds must correspond to their alphabet. It also covers linguistic analysis either at the level of word or at the levels of language where sound is assumed to be structured for covering linguistic meaning.

Phonology includes the study of equivalent organizational systems of signs in language. The study of verbal communication structure within the language is known as phonology. For Example, "Cat" and "Hat" both contain three phonemes. While the word "Shape" just has five letters and three phonemes. One of the key aspects of phonology is the concept of minimal pairs, which are words that differ in only one sound, such as "cat" and "bat." By learning to distinguish between these minimal pairs, children can develop a better understanding of the sound system of their language and improve their ability to communicate effectively.

Topic 008

Morphology:-

The term morphology is Greek and is a makeup of (Morph) means shape form (ology) means the study of something. Biology is the scientific study of the structure of animals and plants. Geology is the study of the formation and evolution of rocks and landforms. Morphology is the study of the structure of words and how they are formed from smaller units of meaning known as morphemes. Morphemes can be combined in various ways to create new words or modify existing ones. So, a morpheme is a series of phonemes that have a special meaning. They also include base words. For example, cat and cow.

Other morphemes are prefixes, suffixes, or other linguistic pieces that are not full words on their own but do affect meaning such as the pluralization

For example, the word "unhappily" is made up of three morphemes: "un-" (a negative prefix), "happy" (a root word), and "-ly" (an adverb suffix). Morphology is important for language development because it allows children to understand how words are constructed and how they can be modified to convey different meanings. Children begin to develop an understanding of morphology at a young age, with the ability to use inflectional

morphemes (such as adding "-s" for plurals) developing by around age 2 and the ability to use derivational morphemes (such as adding "-er" for comparatives) developing later in childhood.

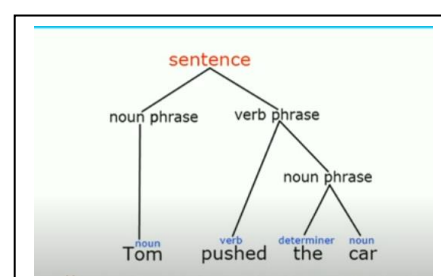

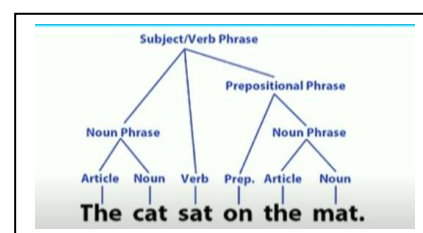

Topic 009

Syntax:-

Syntax is the study of the rules that govern the structure of sentences and phrases in language and it determines which words go where. A sentence in the English language is composed of pronouns + verbs + nouns e.g. I play cricket daily. If the sentence's structure is incorrect, its meaning is incomplete. Therefore, studying syntax allows us to understand the rules about how language works. Every language has a different set of grammar and syntactic rules.

In English, the smallest form of a sentence is a noun and a verb phrase e.g., the word “Go” gives an order command but gives some meaning as well. Furthermore, adjectives and adverbs can be added to the sentence to provide further. Word order matters in language. **For examples.**

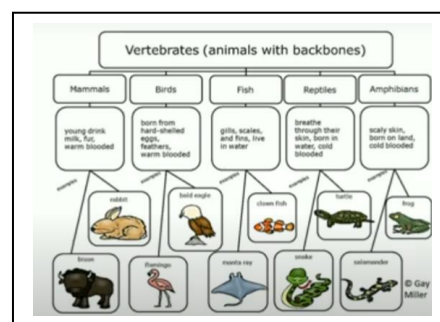

- Ahmad ate the apple and apple ate the Ahmad does not have the same meaning, even though they contain the exact same words.
- “The cat sat on the mat” has a different meaning than “The sat cat on the mat”, even though the words are the same also its syntactic structure will be incorrect from the first sentence.
- “Tom pushed the car” has a different meaning than “The car pushed Tom”, even though the words are the same. But there is a difference between their sentence structures. An understanding of the meaning and structure of language is crucial for effective communication.

So, syntax involves understanding how words can be combined to create meaningful sentences, and how the arrangement of words can impact the meaning of a sentence. Syntax is important for language development because it allows children to communicate effectively and convey complex ideas.

Topic 010**Semantics:-**

Semantics plays a crucial role in the language development of children. It is the study of the meaning of words, phrases, and sentences, and how they are used in context. As children learn to communicate, they need to understand the meanings of words and how to use them appropriately in different situations. It provides complete meaning if the sentence structure is correct, otherwise, it does not. So, the sentence should be constructed according to syntactic rules (placement of words, and phrases). One of the main reasons we use language is to pass meaning from one person to another, and semantics deals with it. Semantics also tells us about the grammatical structure of the language to understand it. Semantic refers to how a language conveys meaning. Semantics moves beyond the literal meaning of words in language and is culture dependent. So, meanings can be different in various languages. To conclude, semantics tells us to focus on true meanings rather than literal meanings.

**Topic 011****Pragmatics:-**

Pragmatics is the study of how language is used in social contexts. Kempson's (1986) pragmatics is concerned with the general principles necessary for retrieving information from a specific utterance based on the context. Moreover, it is the study of human actions, thoughts, and linguistic signs (words and sentences) in real situations. For example, The communication style of a child with his parents or siblings is different from the communication style with his friends. Pragmatics involves understanding the social rules that govern language use, such as turn-taking, topic maintenance, and politeness. Pragmatics plays a critical role in language development, as it allows children to use language effectively in social situations.

For example, The language used in a formal conversation may have less resemblance to what we could hear at lunch with our fellow children. And the conversational style that we use in our day-to-day conversations is much more different from that of the language we use when we are reading a storybook for a kid. Basically, pragmatics focuses on language styles, their uses, and differences. Also, it tells us that we can't rely on a single style of language. So, pragmatics deals with knowing the difference between the two styles and when to use which style. As children begin to acquire language,

they learn to use language for a variety of purposes, such as requesting objects, making comments, and asking questions. Through these early interactions, children begin to develop an understanding of how language can be used to communicate with others and achieve social goals. Moreover, pragmatics studies human actions and their explanation by signs in language.

Lesson No. 3**GRAMMAR AND FEATURES OF LANGUAGE****Topic 012****What is Grammar?**

The systematic study and description of language is called Grammar. It doesn't have meaning by itself. Grammar is the system of rules that govern the structure of language, including syntax (e.g., sequence of parts of speech), morphology, and phonology. In linguistics, grammar is the set of structural rules, regulations, and principles (which are used to organize sentences, make sentences, to communicate correctly with other people) that govern the composition of clauses, phrases, and words in any given natural language. Thus, correctness in language can only be achieved through grammar. In the context of language development in children, grammar refers to the rules that children learn to produce and understand language.

Noam Chomsky one of the most influential linguists of the 20th century interested in the grammatical use of language. He also worked on Universal grammar. He believed; Allah has given human brains the inborn qualities needed to acquire language with LAD (Language Acquisition Device). Using this ability, humans use a finite set of structures and rules to produce an infinite number of grammatically correct sentences. Language cannot be learned; a child can only acquire it in a particular environment. As children acquire language, they begin to learn the rules of grammar naturally through exposure to the language used around them.

Mechanism of Inherent Theory: According to Noam Chomsky, the mechanism of language acquisition formulates from an innate process. On the other hand, there are some grammatical sentences that can never be considered as fully acceptable utterances because of their semantic, syntactic, or phonological content.

Topic 013**Kinds of Grammar:-**

There are different definitions of different kinds of grammar offered by different scholars. So, there are four main types of grammar in the study of language development.

- 1- **Mental Grammar:** Internal linguistic knowledge: The knowledge of language in mind. So, it is phonology, morphology, syntax, and semantics. The linguistic

knowledge we are using is known as mental grammar. In simple words, the brain uses the internal cognition process to understand the language or linguistics called mental grammar. Grammatical knowledge is also considered structural knowledge. However, it is very important to know how to use structural knowledge.

- 2- **Developmental Grammar:** The mental grammar at the developmental stages; An individual who is learning a language or who is at the developmental stage of language, called developmental grammar. In Pakistan, L1(Language 1) refers to Urdu and L2 (Language 2) belongs to English. To understand both L1 and L2, an individual will use developmental grammar principles to understand language. This also tells us about the results of a normal pattern of development and is common among language learners. Hence, Developmental grammar is used at the learning stage of language.
- 3- **Descriptive Grammar:** The word descriptive means "to describe something". This type of grammar is very common. Descriptive grammar is concerned with describing the rules of language as they are used by speakers and writers. This involves analyzing the structure of language and the patterns that are observed in real-world language use. Descriptive grammar rules are more general and more basic than prescriptive grammar rules in the sense that all sentences of a language are formed in accordance with a subset of sentences that count as correct or socially acceptable. While Language description is not evaluated or considered by social correctness in descriptive grammar. Moreover, this type of grammar focuses on how language is used in context, and how it evolves and changes over time.
- 4- **Prescriptive Grammar:** Prescriptive grammar, on the other hand, is concerned with providing a set of rules for "correct" language use. It involves defining the proper usage of language and often provides a standard for language use that is deemed acceptable by society (including how should we speak and write the language.) Prescriptive grammar is often taught in primary and elementary schools and is commonly found in grammar books.

The term grammar school historically refers to a school teaching Latin grammar to future Roman citizens, orators, and later, Catholic priests. In the context of language development in children, descriptive grammar is seen as more important than prescriptive grammar. This is because children learn language through exposure to the language used around them and can develop their language abilities naturally by observing and imitating the language patterns they hear. The new theory, "The primacy of spoken language" also

claims that we acquire the language through spoken English as compared to other skills. and prescriptive grammar can be useful for teaching children about standard language use, it is important to focus on descriptive grammar to understand how children acquire and develop language.

Topic 014

Features of Language:-

Human language is distinct and unique because there are specific features that distinguish human language from any other form of communication. Human language is considered special because of its special features and characteristics. Other creature's languages are only based on sounds. While human language is far away from sounds, it conveys messages in the form of words and sentences. It is unique from such forms of animal communication. Because it has linguistic rules (for example: grammar, sentence construction and its order, parts of speech, and the Noam Chomsky view (Innate quality of Language) that are followed to speak.

Language has several key features that make it a unique and powerful tool for communication. Some of the most important features of the language include: Displacement and productivity are part of “true language”. These are abilities found only in humans, not all languages have them. Displacement is the most recognized feature of human language.

1. **Duality of patterning:** Language has both a surface structure (the actual sounds and words used) and a deep structure (the underlying meaning). This feature associates sounds with meanings for example, in CAT/TACK/ACT the same phonemes are expressed but organized in a different order to convey different information.
2. **Productivity:** The ability to produce an infinite number of sentences using a finite set of words and rules. Productivity is also the ability of the native speakers to use certain grammatical processes.
3. **Interchangeability:** Language is learned through social interaction and is passed down from generation to generation within a cultural context. In this feature, both the sender and receiver are responsible during the communication process. So, speakers can send and receive messages. It is also considered as a reversible ability to send and convey a message.

4. **Arbitrariness:** There is no inherent connection between the sounds of a word and its meaning; the relationship is arbitrary and must be learned. For example, the words “whale” and “microorganism” do not convey any relation to the size of physically of the word and the physical of the subject.
5. **Displacement:** The ability to talk about things that are not present in the immediate environment. As other creatures can only talk about the current danger and action. But human beings can communicate about the past, future, and distant places.
6. **Cultural Transmission:** The main source of cultural transmission is Language. The specifics (Traditions, Norms, and Values, etc.) of any culture can only be transmitted through language. Therefore, language is a complete world that can express a specific area of traditions, norms, and values and transmit the culture as well.

These features of language are critical for the development and use of language in children. As they learn the language, they come to understand these features and use them to communicate effectively with others.

Topic 015

Discreetness:-

Discreteness in language development refers to the fact that language is composed of discrete units, such as individual sounds (phonemes) and words, which can be combined in a variety of ways to form meaningful utterances. For example, the difference between “i” (short vowel), and “i” (long vowel) is not very great, but when using these sounds in a language we cannot use “i” (short vowel) instead of “i” (long vowel) because then there is a distinction in meaning. Sound has different meanings, depending on where it is placed and what it sounds like, so changing their meanings can change the meaning of words. It is the same with pairs like p, b, t, d, and so on. Discreteness is an essential feature of language, as it allows for complex communication by creating a large vocabulary from a finite set of building blocks. The property of language when each sound is treated as discrete is described as Discreetness. For example, the English word tin would consist of three units t/i/n. Speech units can be ordered and recorded, combined, and split apart. Therefore, the property of language when each sound is treated as discrete is described as discreetness.

The fact that the pronunciation of the forms back and back leads to a distinction in meaning can only be due to the difference between the “p” and “b” sounds in English. Each sound in the language is treated as discrete because of the distinctiveness of each sound, but due to some minor differences, their meanings will be different, and meanings attach to their sounds. Children learn the discrete units of language through exposure to the language used around them, and as they acquire language, they become proficient at combining these units in increasingly complex ways.

Topic 016

Creativity:-

Creativity is the art of self-directed learning. Creativity is a key aspect of language development in children, as it allows them to use language in new and novel ways to express themselves and communicate with others. Children are constantly experimenting with language, trying out new words and sentence structures, and playing with the rules of grammar to create unique and meaningful utterances

(Knowledge of how to combine words from phrases and sentence phrase = syntagmatic group sentence = phrase clause preposition) The ability to create and understand sentences and give them new meanings by altering them, changing, or adding a few phrases, is creativity. As creativity deals with the idea of a new or advanced way of doing something. For example, He dreamed of pigeon-toed giraffes and cross-eyed elephants dancing in pink skirts. The sentence is very different and is not used in everyday life, but we can make sentences by using other words.

Keep remember there is no restriction for upper bound on the size of sentences.

For example:-

- This is the house that Jack built.
- This is the malt that lay in the house that Jack built.
- This is the dog that worried the cat that killed the rat that ate the malt that lay in the house that Jack built.

So, this creativity is facilitated by the open-ended nature of language, which allows for the formation of an infinite number of sentences and meanings from a finite set of building blocks. While solo taxonomy (uni/multi-sentence structures) can also be used to provide different and new meanings of the sentences. In human language, creativity is one of the important characteristics. Through this feature, we can create beauty in language, explain concepts, and provide detailed demonstrations. As there is no restriction for upper bound

on the size of sentences. The mentioned examples show the repetition of the word, and it is also called creativity.

- The old man came.
- The old, old man came.
- The old, old, old, old, old man came.
- Once there was this little boy who asked his father to tell him
- That old, old, old, old, old story
- Yoko Ono, A Little Story

Topic 017

Displacement:-

Most animals, insects, and birds can communicate about things in the immediate environment only or present. The only time they talk is when they are in danger or when they are in need. Their language cannot give information about danger in the past or future. Human language by contrast can communicate or talk about things that are not present in the immediate environment. This means that people can discuss events that have happened in the past or may happen in the future, as well as imaginary or hypothetical situations. This feature of human language is called displacement. For example, if we (humans) live in 2023, then we can speak about events that happened in the past or the future. Also, we can discuss sudden changes.

Displacement is made possible using abstract symbols and concepts that can represent ideas and experiences beyond the here and now. For example, the moon, stars, dragons, math, equations, fear, heaven, hell, and so many other things. Animals' communication is generally considered to lack this property. Their communication is only based on sounds. It is also noted that the honeybee can convey his message, but it rather is limited, and only honeybees can understand their conversation. It is not possible for a human being to understand their language. This feature of language allows humans to create fiction and to describe possible future worlds or possible things that will happen based on past events. To conclude, displacement means the ability to talk across time and space. It is a feature of human language that animals cannot acquire it.

- **Universality**; refers to the equilibrium across humanity on linguistic grounds.
- **Competence and Performance**, which means that language is innate (cognitive thinking and information) and produced in society and furthermore, language is

culturally transmitted. Through displacement, we can talk about these two concepts: universality, competence and performance. So, Language is learned by an individual from his elders and is transmitted from one generation to another.

Topic 018

Do Animals Have Language?

Language, in its conventional form, is primarily associated with humans. It involves a complex system of communication that utilizes a set of symbols or vocalizations with agreed-upon meanings to convey information. While animals do not possess language in the same way humans do, they do exhibit various forms of communication.

Animals and insects can communicate with each other through a combination of vocalizations (sounds), body language, and chemical signals. Animals can only understand their language. They use these methods to convey information about danger, territory, mating opportunities, food sources, and other essential aspects of their lives.

Some philosophers also considered this theory that human language also evolved through animal language. Only in fiction, Animals can speak and hold meaningful conversations. Fiction can also be provided by human beings. There are lots of books that are based on fiction that explain the communication of animals. Winnie the Pooh to the Beatrix Potter books are written for children. **There is also a fact that we can teach animals about language through sounds.** For example, we can train cats, dogs, and monkeys, and Tobermory is a cat who has been taught to speak, to the consternation of guests at a house party. The fiction of Tobermory also explains that Tobermory says to a woman who is foolish enough to ask his opinion of her intelligence. Therefore, Sir Wilfred protested that you were the most brainless woman of his acquaintance and that there was a wide distinction between hospitality and the care of the feeble-minded.

Animals do not possess language as humans do, but they exhibit a diverse range of communication methods that allow them to interact and convey important information to others in their social groups. The study of animal communication provides valuable insights into the evolution of communication systems and the complexities of non-human cognition.

Lesson No. 4

LANGUAGE PROPERTIES

Topic 019**Properties of Language:-**

Language is the most flexible, and complex or versatile system of communication that allows humans to convey information, thoughts, and ideas to others. There are lots of characteristics and properties of human language that can make a difference in the language of other creatures.

Natural languages are codes and may be compared with other codes in all sorts of ways. However, there is a problem in deciding what properties of the codes or communication systems in which they operate is significant. Language properties can be used to compare languages and find out what properties are significant, which are insignificant, and which are less significant.

Here are some of the key properties of language and it has been described how they are displayed in human language:

1. **Arbitrariness: (Randomness):** This refers to the fact that there is no inherent connection between the sounds or signs of a language and the meanings they convey. Also, arbitrariness makes the signals more difficult to interpret for one who does not know the system.
2. **Productivity:** This property of language refers to the ability to create new utterances using a finite set of rules and symbols. According to Noam Chomsky, through the innate ability of human beings, we acquire language. We can combine words to form new phrases and sentences, and we can create new words when we need to describe new concepts.
3. **Cultural transmission:** Language is not innate but is instead learned through cultural transmission. Children learn language from the people around them and through exposure to language in their environment. Each culture has two aspects: thinking and practical. The practical aspect is based on values and traditions that are transmitted from one generation to another generation through the language. Therefore, language is one of the sources of preserving and transmitting culture from one generation to another.

4. **Discreteness:** Discreteness is opposed to continuity or continuous variation property of secondary elements sounds used to produce language are distinct from one another. Language is made up of discrete units, such as words, syllables, and phonemes. These units can be combined in different ways to create meaning, but they are still distinct and separate from one another.
5. **Duality of patterning:** It associates sounds with meaning. This property refers to the fact that language is made up of two levels of structure: the level of individual sounds (phonemes) and the level of larger units such as words and sentences. The sounds of language can be combined to form words, and words can be combined to form sentences.

Topic 020

Language as a Social Tool: -

It is common knowledge that language can be used as a social tool to accomplish tasks. But utterances are taken to be constituted as the encoding of mental contents. During the encoding and decoding of information, there are several steps involved. A proper encoding process ensures that the decoding process is also performed in the correct order.

In the mind cognitive process, the functions that operate and language operation, and the feelings, and thoughts which we are expressing. All this can be done through language development. Language can also be used to perform and express the realities of society and culture. The language uses a situation-based approach. Depending on the situation and environment, we used different words and sentences. Language is not being used as a single tool or to serve a single purpose. Therefore, the use of words is dependent on the situation.

For example, there are differences between the teacher's role in the classroom and the parent's role at home. In particular, sounds are tools for engaging the common understandings that constitute social realities. Sounds are phonemes (consonants and vowels) that convey information in the form of words and then become sentences, which are then able to communicate with others. To express the language, rules and regulations are used. As language is a rule-governed system. There are different approaches used to consider language as a social tool. Furthermore, the encoded symbols are used in the service of the actions (when communicating, or when sending a message to the receiver, which is decoded by the receiver). Also, it is important to ensure that the message is not

distorted when it is sent. Otherwise, the purpose of language as a social tool will not be fulfilled.

Doing Things with Words

- J.L Austin was an early investigation of actions performed with word assertions commands promises.
- Searle is one contemporary who has followed this path.
- Others also focused on actions using words, such as the latter.
- Wittgenstein's association of language to a toolbox.

Language is a social tool that plays a crucial role in the development of a child's language skills. Language is not only a means of communication, but it is also a way of expressing oneself and establishing social connections with others. Through social interactions, children learn to use language to express their thoughts, feelings, and ideas.

Topic 021

Language as a Rule-Governed System:

Language is a rule-governed system, which means that there are specific rules and principles that govern the way language is used. These rules and principles apply to all aspects of language, including its sounds, words, grammar, and meaning.

According to Neil Smith and Deidre Wilson, language is a rule-governed system and thus can be expressed in the form of grammar. It means the language learner or language acquirer both have to follow certain language rules. Each form of language (Spoken, written) has some specific rules and standards. Language is a basic source of communication and people use it to convey their information and ideas. Moreover, it has been observed that many people do not understand the meaning and functions of language. In order to use them properly, they must learn and understand them.

Smith and Wilson presented a theory of what a language is, and they argued that language is rule-governed. According to their theory, language is a set of rules that allow speakers to generate an infinite number of sentences, each of which has a specific meaning. There have been a number of definitions of what a language is and, in each definition, there is an aspect that points out Language is a Rule-Governed system.

The key features of language as a rule-governed system are grammar, morphology, morpheme, phonology, semantics, and pragmatics. As, the rules of language are systematic and predictable, and they apply to all aspects of language, including the sounds, words,

grammar, and meaning. The rules of language allow us to create new words and sentences, as well as to understand the meaning of others' words and sentences.

Linguistic and Other Language Theories; argue language is a complex system that requires systematization and description in its grammar. Thus, language is not an easy process, as many components are processed simultaneously. For example, propositions, parts of speech, sentences, tense structure, active or passive voice, etc. In using the language, all these parts tell us where to go, where to stop, and where to flow. All of this can also affect and change meaning.

Modern linguistic theory claims that a language is rule-managed to maintain that it can be described in terms of grammar which is a set of rules. One of the key features of language as a rule-governed system is its grammar. Grammar refers to the rules that dictate how words are combined to form meaningful sentences. Every language has its unique grammar, and learning the grammar of a language is essential for effective communication.

Topic 022

Language as generative:-

The child of a family at the developmental stage of language is staying in the forest for some reason. Human sounds and language were not audible to him. In this way, he learns how animals communicate. On the other hand, one child in his family lives with his parents. It is easy for him to learn and understand human language, as well as to generate it. This is an example of language as generative.

Language is a broad concept. It is a school of thought within linguistics. It makes use of the concept of generative grammar. One great proponent of this concept is Noam Chomsky, who presented the theory of Nativism. He claimed that the human brain has an innate ability to help in understand and acquire language. He generated the concept based on applied grammar, at the same time humans can produce an infinite number of sentences from a finite set of rules.

Noam Chomsky: Noam Chomsky distinguishes between E-language aims: He collects sample data to analyze and present theories, ideas, and principles. He said that based on rules or construct grammar and generative grammar to describe the regularities of language concerned with what a speaker knows about language and where this knowledge comes from. In child language development, this generative capacity is demonstrated through the gradual acquisition of grammatical rules and structures. Children begin by learning individual words and phrases, but they quickly move on to

constructing sentences and combining those sentences to form more complex discourse. This process involves the use of syntax, which is the set of rules governing how words can be combined to form sentences. As children develop their understanding of syntax, they become more adept at generating new sentences and conveying more complex meanings. Language is a system represented in the mind/brain of a particular individual. Chomsky discovered the aim of language in 1988. Actual use of language in concrete situations UG (universal grammar) is part of the competence (human mind- cognitive related) of all language speakers.

Characteristics of Generative Grammar:

- Possible Problems for Analysis
- General Ideas about Language
- Deep and Surface Structures (Competence (higher order thinking) refers to deep structure, Surface belongs to lower level)
- Two Levels of Representation
- The General Concept of Universal Grammar (UG)

Topic 023**Creativity of Linguistic knowledge: -**

Linguistic knowledge plays a crucial role in a child's language development, particularly in the areas of vocabulary acquisition and grammar. Children are born with a basic capacity for language, but their linguistic knowledge and skills develop rapidly during the early years of life, primarily through exposure and interaction with language-rich environments.

Any speaker of any human language can produce and understand an infinite number of words or sentences. This system of rules also explains how speakers can use a fixed set of rules to produce infinite and endless sentences that should be grammatically correct, and this knowledge may be stored in a limited space of the human brain. The rules of syntax permit speakers to produce and understand a limitless number of sentences never produced or heard before. The principles of language allow us to create language, understand it, and convey information through sounds, words, and sentences.

The creative aspect of linguistic knowledge has various means of creating longer and longer sentences or forms. For example, once you made a sentence from one topic. Then, you can also change or modify it, or also add information in it. Basically, it is the ability of a language. It is possible to develop different versions of your language by

creating different phrases, and sentences, and explaining it in various ways through language. Therefore, the creativity of language can define concepts and ideas in detail. By exploiting the resources of our language and grammar, we can produce and understand an unlimited number of sentences full of unlimited ideas and emotions. For example, the addition of a verb with an adverb in a sentence can change the meaning. Aslam writes a letter; He writes a letter (The replacement of nouns with pronouns has also changed the meaning of sentences and the form of verbs). All this refers to language creativity.

Our brain capacity is finite, able to store only a finite number of categories and rules for their combination. The information processing model tells us about how the human brain processes information. There are two memories placed in it i.e., short and long-term. Short-term memory doesn't store information for later use, while long-term memory stores information and can easily be recalled or retrieved when we need it. Practice is required to save data in long-term memory. Through creativity, we can create various categories and forms of language and save them in our brains.

Lesson No. 5**TYPES OF LANGUAGE DEVELOPMENT****Topic 024****Language Development Process:-**

Language development is a complex and attractive journey that children attain from infancy through childhood. The journey begins in the pre-linguistic phase. Infants use cries, coos, and babbling to communicate. When the child is born, he expresses himself by crying or babbling, making his expressions, his needs, and vocalization. This phase is crucial for developing vocalization skills and sensitivity to speech sounds and it is very important for speech sounds.

- **Around 6-10 months:** infants start babbling. They experiment with different speech sounds and syllables. Babbling helps refine motor skills and lays the foundation for speech.
- **At 12-18 months:** toddlers enter the holophrastic phase. As, the holophrastic stage in which the child can speak one word. They use single words to convey complete thoughts. Their vocabulary also grows, and they begin to name familiar objects and express basic needs.
- **Around 18-24 months:** toddlers enter the two-word level. It means they entered the one-word to two-word. They start combining words to make simple sentences. This marks the emergence of basic grammar and more complex communication. From here they also find grammar when they combine words, it also expresses grammar.
- **At 2 to 2.5 years:** children enter the telegraphic level. They construct short, telegraphic sentences, or messages with essential words. This level demonstrates mastery of more advanced grammar.
- **Between 2.5 to 3 years:** language expansion occurs. It means at this level; the child's language is expanded. Vocabulary and sentence complexity increase. Children engage in more detailed and meaningful conversations.
- **Around 3 to 5 years:** language refinement takes place. Now more complex sentences that may be more than two begin to be spoken. Children fine-tune their language skills, including grammar and pronunciation. Language becomes more fluent, accurate, innovative, and sophisticated.

This was the process of language development from infancy to early childhood continues until.

Topic 025

The Language Acquisition Device:-

Language is the medium of communication and is mostly displayed in written, oral, and manual forms. Language is a cognition that truly makes us human. The Language Acquisition Device (LAD) is a theoretical concept proposed by Noam Chomsky to explain the innate ability of children to acquire and understand language. We can produce an infinite number of sentences with correct grammar by the use of a finite number of rules. There is no other species known to date that can express infinite ideas with a limited set of symbols. Language refers to a form of communication in which we learn to use complex rules to form and manipulate symbols that are to generate an endless number of meaningful sentences. Sequence of language development starting at birth. The child only uses sounds till 4 months. Language is practically absent, at about 4 weeks small throaty sounds are noticed e.g., understanding things given by caregivers, and around five years child speaks without childhood pronunciation.

Language Acquisition Device:- According to Chomsky, the LAD is a biological mechanism that enables children to automatically learn the grammatical rules of their native language through exposure to linguistic input. He argued that the LAD is a universal feature of the human mind and that it is responsible for the ease and speed with which children acquire language.

Language development can be broadly classified into three approaches.

- Behaviorism
- Nativism
- Interactionism

Behaviorism: It holds that language develops as a result of environmental influences. Here, the environment will work as a stimulus and the environment influences the language development of the child.

Nativism: The main theorist associated with this perspective is Noam Chomsky. It holds that language development is inborn. The nativist perspective argues that humans are biologically programmed to gain knowledge. For example, A child of a Punjabi speaker

will speak Punjabi automatically due to the environment. Same as the child who lives with English people, will learn easily English language.

Interactionism: It emphasizes the interaction between environmental influences and innate abilities in language development. Interactionists argue that language development is both biological and social (environmental) factors.

Topic 026

Language Development Types:-

There are two main types of language development in children: receptive and expressive language. Referential language refers to the ability to understand language, while expressive language refers to the ability to use language to communicate.

Referential: Children at first express only words and after words join at first into sentences of two words and then sentences of three words. This style is useful for young children to understand vocabulary. At this stage, the child is able to label things and people and try to learn them. And these children are more associated with their adults as compared to peers.

Expressive: In this style child first, utter sounds like babbles that copy the rhythm and beat speech. In this style, children apply language to discuss their specific emotions and requirements. Expressive language development, on the other hand, involves the ability to produce language to communicate with others. These children are more associated with both their adults and peers. Also, they speak social and functional words. They use language to express their needs and emotions e.g., stop it, I wanna go, hi; this is me. Children typically begin to produce their first words around 12 months of age and continue to develop their expressive language skills throughout childhood and adolescence.

Topic 027

Referential Language Development:-

Referential language development refers to the ability to use language to refer to objects, people, and events in the world. This type of language development is critical for effective communication and is an important aspect of child language development. Children at first express only words and afterward, join them together. First into sentences comprising of two-word and later into sentences comprising three words. It is a style of right-time learning of language in which children use language for the most part to label objects and people.

Children begin to develop referential language skills early in life or young children, with infants showing an ability to attend to and differentiate between objects in their environment. As they grow and develop, children become increasingly proficient at using language to refer to these objects, people, and events. This includes the ability to use words to name objects and to talk about them in more complex ways, such as describing their attributes or their location in space. Children use more single words, gradually building longer phrases and sentences from there.

It is also noted that at this stage of the child, tends to interact more with adults and less with peers. Children also use action verbs (to tickle) to reference an event in the world or in a depiction (someone being tickled by someone else). In summary, referential language development is a critical aspect of child language development that involves the ability to use language to refer to objects, people, and events in the world. This type of language development is influenced by a variety of factors, including children's exposure to language, their cognitive abilities, and their social interactions.

Topic 028

Expressive Language Development:-

Expressive language development refers to a child's ability to use language to express their thoughts, feelings, and intentions to others. This type of language development is essential for effective communication and is a critical aspect of child language development.

Most kids utilize a blend of two language styles. It is also noted that at this stage of a child, interacts with both adults and peers and uses social words. Children in this stage are trying to interact with each other without caring about the grammar and sentence structure; they are just interested in conveying the information and becoming more socialized as a result. They also used a combination of two words, for example: stop it, and I want to go. Furthermore, in this style, little children apply language to discuss their specific emotions and requirements. Kids first utter sounds like babbles that copy the rhythm and beat speech. Young children with language difficulties face poor eye contact due to the difficulty in language. A limited spoken vocabulary (less than 50 words at two years of age). Initially, children's expressive language skills are limited to a few words, but they rapidly develop and expand their vocabulary as they grow and interact with their environment. Children also begin to use grammar to convey increasingly complex meanings, such as forming sentences and using pronouns.

Research has identified several factors that influence expressive language development. One of the most important factors is the amount and quality of language exposure children receive from their caregivers and environment.

Topic 029

Transitions of Language Development:-

A transition or linking word is a word or phrase that shows the relationship between paragraphs or sections of a text or speech. Language development in children is a continuous process that involves several transitions as they grow and develop. These transitions mark significant changes in a child's language abilities and are influenced by various factors, including social interactions, cognitive development, and exposure to language. Therefore, three transitions help to explain a kid's acquisition.

First Transition: The first transition in language development occurs around 12 months of age (first-year ends and it proceeds in the school year) when children begin to produce their first words and transition from pre-linguistic communication to language use. The emergence of words into essential vocabulary such as combinations of phonemes, phonetics, and changes in the positions (start, middle, or end) of consonants, and vowels. For example, at, pat. This transition involves the development of expressive language skills and the ability to use language to communicate with others.

Second Transition: Another significant transition occurs between the ages of two and three when children begin to produce longer and more complex utterances, including sentences and multi-clause constructions. In this stage, children change from saying one word at once. They also join words into expressions and basic sentences about the end of the school year. This transition involves the development of grammar and syntax and the ability to use language to convey increasingly complex meanings.

Third Transition: Around the age of four, children enter a third transition in language development as they begin to develop metalinguistic awareness, the ability to think about and reflect on language as a system. At this stage, kids move after utilizing simple sentences to express themselves. One thought to complex sentences communicating different thoughts and the relationship between them. This transition involves the development of language-related skills, such as reading and writing (e.g., paragraph speech, etc.), and the ability to use language to think and reason about the world.

Lesson No. 6

KEY SIGNS OF THE LANGUAGE DEVELOPMENT PROCESS**Topic 030****Key Sign of Language Development:-**

Children everywhere throughout the world follow the same model of language development. Because in the whole world, only Allah has given this language system to humans, they start with sounds, then words, and then make sentences. This process starts from birth. Several milestones of which are as follows.

A child uses his or her voice to express pleasure and displeasure. He is able to move his or her eyes in the direction of sounds and responds to changes in the tone of your voice.

Babbling and gestures are two key signs of language development in infants. Children dynamically make sounds from birth to onward years to attract attention. These continue till the middle of the first year.

- **Crying:** Infants even cry during childbirth, which can indicate trouble, but these sounds indicate many other things also.
- **Cooking:** Children first utter murmuring sounds which are pronounced from the backside of the throat and generally convey delight in interaction with the caregiving persons.
- **Babbling:** Babbling is a pre-linguistic vocalization that typically begins around 6 months of age and involves the repetition of consonant-vowel combinations. Infants' babbling becomes more complex as they grow and develop, and it serves as a precursor to the development of speech and language. Babbling is thought to play a critical role in the development of phonological awareness, the ability to recognize and manipulate the sounds of language. After the age of 1 or 1.5, a child uses one-word sentences and then two-word sentences. Three-word sentences and so on.
- **Gestures** are another key sign of language development in infants. Infants use gestures such as pointing, reaching, and waving to communicate their intentions and desires to others.

One key sign of language development in children is the acquisition and use of vocabulary. Children begin to acquire words and meanings from an early age, and by the time they reach preschool age, they typically know thousands of words. The ability to acquire and

use a wide range of vocabulary is critical for effective communication and is a key aspect of language development.

Topic 031

Role of Nature and Nurture in Language Development:-

Nature states that a child is born with genetic inheritance. On the contrary, nurture is the result of exterior influences after the child is born exposure, and experience in learning. The role of nature and nurture in language development has been a topic of debate for many years. Nature refers to the genetic and biological factors that influence language development, while nurture refers to environmental factors such as social interactions, exposure to language, and cultural influences. For example, after birth, children have to interact with their parents and other family members

The Role of Nature in Language Development:

Infants are gifted to grasp objects, recognize numbers, and faces, and speak the language. Research suggests that both nature and nurture play a critical role in language development. For example, genetic factors may influence a child's ability to acquire language, such as the ability to recognize and distinguish between different sounds in language. Behavioral genetics says this tendency appears early in life and remains continuous throughout a lifespan. For example, recognition of faces, carrying objects and speaking words or sounds. Moreover, neuroscience says that the genome has a rich toolkit of axion molecules, and cell adhesion molecules to aid the structure of the brain during language acquisition (word recognition, or sound production) making learning possible.

The Role of Nurture in Language Development:

The innate organization of the brain cannot be overlooked but has helped to re-evaluate our conception of nature and nurture. Thus, there has been a constant struggle between supporters of nature and nurture to explain language learning. However, environmental factors such as the quality and quantity of language input also play a significant role in language development. Children who receive more language input from their caregivers and have more opportunities for social interaction tend to develop stronger language skills. Cultural influences such as the language spoken in the home and cultural practices related to communication also influence language development. For example, when mothers speak to their children, play with them, and listen to stories and other books,

their children's language acquisition speed increases. To conclude, the inborn and innate capacities or abilities cannot be overlooked but have helped to re-evaluate our conception of nature and nurture.

Topic 032

Inheridity and Language Development:-

Inheridity means the things which are attained or achieved by birth from the parents. Genetics and inherited factors play a significant role in a child language development. Children inherit a genetic predisposition to language acquisition, which can influence their ability to learn and use language. Research shows that genetic factors can affect the development of language processing in the brain. For example, certain genetic mutations can lead to specific language impairments, such as difficulties with grammar or vocabulary. Genetic factors can also influence a child's overall cognitive abilities and linguistic skills. Researchers have also assessed that from mid-childhood to early adolescence has a greater genetic/inheritance influence on language and literacy skills. As a result of individual differences, this can also vary from child to child. Infact, siblings differ from each other as well.

However, genetics alone cannot fully explain the complexity of language development. The environment in which a child grows up and the experiences they have also play a crucial role in shaping their language skills. So, genetics and innate abilities can also flourish with time, as a child grows. The amount and quality of language input that a child receives from caregivers and other adults can significantly impact their language development (including, sound speed, and understanding level can be different from child to child. For example, An individual's intelligence is inherited from their mother

Other studies also claimed that during language development, the process of genetic innovation and amplification are also involved. Innovation refers to novel genetic factors emerging during development. For example, the emergence of new words, and sentences, mention one/two/three-word sentences in language development. In contrast, amplification refers to genetic influences that are associated with a trait and personality throughout development. As, some children quickly speak the language, compared to other children, and when both factors environment, and inherit involves, language pronunciation, speed, and correctness become more flourished.

A meta-analysis of twin studies on cognitive abilities suggested that understanding of language, pronunciation, and words, expression of needs novel genetic influences predominate during the transition from early to middle childhood, supporting innovation. The developmental origins of genetic variation contributing to child and adolescent language, literacy and cognition are little characterized. Genetic relationships with early childhood receptive vocabulary are unknown in the spectrum of interrelated later-life skills that are genetically related. Early childhood language abilities is only partially understood. Expressive and receptive vocabulary was assessed at 38 months using the report and age-specified defined word lists adapted from the MacArthur communicative development inventory words and sentences and declared that inheritance has a great influence on the communicative development of the child.

Topic 033

Individual Differences among Children:-

Individuals can be exactly alike in their resulting development and adjustments. The unique characteristics and traits emerge as children pass from one stage to another. Individual differences in language development are a common phenomenon among children, and understanding these differences is crucial for promoting their overall language development and success. There are many types of individual differences such as physical and internal. These are unique characteristics and traits that emerge as children pass from one stage to another. So, individuals can be exactly alike in their resulting developments and adjustments. Here only explain the individual differences with reference to language development.

The rate of development is not the same for all individuals. There are some children who develop and learn language faster than others. According to research the amount and quality of language input that children receive from their caregivers can significantly impact their language development. Children who are exposed to a language-rich environment and who receive high-quality language input from their caregivers are more likely to develop strong language skills. On the other hand, children who are exposed to a language-poor environment or who receive limited language input are at risk of experiencing delays or difficulties in their language development.

A child's temperament, such as their level of shyness or extroversion, can also affect their language development as it can impact their social interactions and exposure to language-rich environments. Therefore, parents, caregivers, and teachers need to

recognize and accommodate individual differences in language development. Tailoring language learning experiences and interventions to meet the individual needs of each child can promote their overall language development and success.

Moreover, the environment modifies to a certain extent the effect of heredity. It also provides the direction of the growth and development of an individual. But heredity gives potential, growth, and development of the individual differences. Individual differences in language development can also arise due to various factors such as cognitive abilities, learning styles, temperament, and environmental factors. For example, a child with strong auditory processing skills may excel in spoken language development, while a child with strong visual processing skills may excel in written language development.

Topic 034

Concept of Diversity in Language:-

Language development among children of linguistic diversity. Diversity plays an important role in language development as it allows children to be exposed to a wide range of languages, dialects, and communication styles. According to a study by Barbu, Serratrice, and Stokes (2016), exposure to multiple languages and dialects from an early age can lead to greater linguistic flexibility and cognitive advantages in children. Dialect is a diverse specialized variation of a language. It is typically used in oral language regional and social variations. For example, In Pakistan, the people of Punjab speak Punjabi with different accents and dialects. Thus, dialects are different in each district. Therefore, the diversity of dialects is called language flexibility. Similarly to the UK, different dialects of English are used throughout the provinces. So, dialect shows the interactions of different language groups.

Small vocabulary and simple grammar are used because of the limited functions. When one language dialect across two generations of linguistic features expanded, it became the mother language. And this type of language has permanence in it. **There are two main types of English around the world, American and British.** Standard American English dialect used in business and educational settings “standard” dialect. The diversity of language and dialect is historical, and it grows and moves with time. Culture also plays an important role in the development of dialect. Language is the preservation or saving of any culture. Therefore, language diversity varies from culture to culture. For example, African American is an English dialect that has richness of linguistic complexity. It is also considered as a separate and authentic dialect. Not a broken form of

English Bi-dialectism provides linguistic flexibility. Whorf - Sapir hypothesis, the way we think is influenced by our language Verbal Deficit Perspective Anything other than Standard Average European (SAE) is a poorly proven invalid socialization mismatch hypothesis. Languages that are not developed properly or in a proper way create problems and are considered weak. The difficulty also arises when we fail to address diversity.

However, it is important to note that diversity in language development can also pose challenges for children who are learning multiple languages or who are exposed to dialects or communication styles that differ from their own. Parents, caregivers, and teachers need to provide support and resources to help children navigate these challenges and to promote their overall language development. Diversity in language development also helps children to develop a greater understanding and appreciation of different cultures and perspectives. It can promote empathy, respect, and inclusivity, and can help children to develop the skills needed to communicate effectively with people from diverse backgrounds.

Topic 035

Nurture in Language Development:-

The nature argument might suggest that the ability to understand language is innate regardless of the environment a child finds themselves growing up. Whereas the nurture argument suggests that language ability is fully determined by the environment and that all children can develop the same language. Nurture, or the environmental factors that influence language development, plays a crucial role in a child's language acquisition process. According to a study by Hart and Risley (1995), the amount and quality of language input that children receive from their caregivers can significantly impact their language development. Children who are exposed to a language-rich environment and who receive high-quality language input from their caregivers are more likely to develop strong language skills.

Ways to Nurture Your Child's Language Development:-

- Read to your baby routinely (It is very important for parents to study their children's words and sounds and to listen to them attentively)
- Let dad or mothers read the bedtime stories too, (This improves learning skills, which is the primary objective of language learning)
- Narrate the day as it unfolds.
- Introduce your child to “big” words.

- Carefully correct poor pronunciations

Nurture refers to all the external or environmental factors that affect human development such as how someone is raised, socioeconomic status, early childhood experiences, education, and daily habits. In addition, social interactions, early childhood experiences, education, and daily habits also play a significant role in language development. Children who have frequent opportunities to engage in conversations, participate in language-rich activities, and receive positive feedback and reinforcement for their language skills are more likely to develop strong language abilities.

Topic 036

Environment and Language Development:-

The theory of empiricism posits that knowledge and skills are acquired through his/her experiences and interactions with the environment. Interaction with various environments is called environmentalism. More exposure to the environment better and fast the acquisition process. There are lots of dimensions and types of environments. Hence, interaction with different environments can enhance a child's language development.

In the context of language development, this means that a child's language skills are influenced by the linguistic input they receive from their environment. According to this theory, children learn language through imitation and reinforcement of language use by their caregivers and other individuals in their environment. The environment plays a crucial role in a child's language development. According to a study by Hoff and Tian (2005), the quality and quantity of language input that children receive from their environment is strongly correlated with their language abilities. Children who are exposed to a language-rich environment and who receive high-quality language input from their caregivers are more likely to develop strong language skills. There are lots of environments, so the language developmental experiences of the child are also different.

Family Environment: The parents who give more reading time to their children to learn their language quickly. The mother's language influences the child's vocabulary and the environmental influences behavioral view. It means the occurrence of some event or incident. Language is complex learned, skilled, and reinforced.

Strategies for language development in children: -

- Parents, and older children modify their speech
- By representing, rephrasing
- expanding, restarting,
- labeling, identifying objects by names

Some more strategies:-

- Teacher's role (Parents, caregivers, and teachers can play a significant role in supporting children's language development by providing high-quality language input and creating opportunities for language-rich interactions and experiences)
- Cartoon (It helps to refine the words capacity of the children)
- Movies (e.g., Lion king, Peter, and the rabbits)
- Physical environment in the class (Early childhood classes are group-based and peer-forming, resulting in an environment that promotes student interaction)
- The room arrangement and placement of instructional material
- Group reading
- Access to classroom literacy material and objects (arrange them, different colors)

Lesson No. 7

LEARNING PERSPECTIVES**Topic 037****Factors Influencing Language Development:-**

Language development is a complex process that is influenced by a wide range of factors. These factors can be external and internal as well. Some of the general factors that play a significant role in language development include age, aptitude, intelligence, attitudes, motivation, and personality.

Age: It is a critical factor that influences language development. The children first learn sound, make words, sentences of words, one word or two words. As they become older, they learn complex sentences. It means simple to complex, concrete to non-concrete, and easy to difficult. Research suggests that the early years of life are the most critical for language development, as children's brains are more receptive to language input during this period.

Aptitude: It is an innate and inbuilt capability in human beings. Language aptitude refers to what the speakers of different languages have toward their language's other languages. There is also a philosophy that younger children quickly learn the language.

Motivation: It is derived from the word "motive" which denotes a person's needs, desires, wants, or urges. There are two types of motivation: Intrinsic and Extrinsic. Intrinsic motivation deals with internal happiness and satisfaction. In this type of motivation, there is no reward. The reward for the child is to learn those words and sounds. While extrinsic motivation gets rewards from the environment, and parents. So, motivation is a very important factor for language development. Children who have positive attitudes towards language learning and who are motivated to learn a language are more likely to develop strong language skills.

Intelligence: The ability to understand things, solve mathematical and complex problems, or make decisions with outcomes benefiting the actor. It is also an inborn capacity. Particularly, a child inherits intelligence from his mother. There are also levels of intelligence among children. Language development is also based on the intelligence level of the individual child. Children with higher levels of cognitive abilities and linguistic aptitude are more likely to develop strong language skills. However, it is important to note that language skills can be improved with appropriate interventions and support, even in children with lower aptitude or intelligence.

Attitudes: can also influence language development. Attitude means the way you think and feel about someone or something. Personality traits such as extraversion and openness to experience can also contribute to language learning success. Therefore, positive attitude of children towards learning a language, they will learn it easily.

Learning style: Every individual has different methods of learning or understanding new information. Learning styles include expressing, repeating, and remembering information. Alternatively, they are called cognitive learning styles. According to associative theory, once you have the information in your head and the relevant information you receive, then you will easily be able to comprehend and learn what has been said. Therefore, learning styles vary from person to person and every individual has their own.

Personality: It refers to the enduring characteristics. Behaviors that comprise a person's unique adjustment to life, including major traits, interests, drives, and values. Language development is a complex process that is influenced by a wide range of factors. While age, aptitude, intelligence, attitudes, motivation, and personality are all general factors that can influence language development, it is essential to note that every child is unique, and their language development is shaped by a combination of individual and environmental factors. Therefore, providing a supportive language-rich environment that caters to individual needs and preferences is crucial for promoting optimal language development in children.

Topic 038

The Learning Perspective:-

Learning is “a process that leads to change, which occurs as a result of experience and potential for improved performance and future learning” (Ambrose et al, 2010, p.3). The learning perspective is also known as the theory of learning. It is a psychological approach that emphasizes the role of experience and interaction with the environment in shaping human behavior and development, to best understand a person we need to consider the situation the person is in (How he thinks, and how interacts socially).

Following are the learning perspectives:

- Behaviorism
- Cognitivism
- Constructivism
- Humanism

A psychological approach that emphasizes how the environment and experience affect a person's or animal's actions, it includes behaviorism. Behavior is a factor that can be measured and visible.

A learning procedure in which associations are made between a natural stimulus and a learned neutral stimulus. The view is that behavior can be explained in terms of direct and indirect reinforcement, reward, and punishment. So, learning or experience in determining development or behavior. In the context of language development, the learning perspective suggests that language is learned through a process of imitation, reinforcement, and conditioning. According to this perspective, children learn language by imitating the language use of their caregivers and others in their environment and receiving positive feedback and reinforcement for their language use.

Behaviorism's perspective:- focuses on the idea that all behaviors are learned through interaction with the environment. It states that behaviors are learned from the environment, and innate or inherited factors have very little influence on behavior. It emphasizes the importance of observable behaviors and stimulus-response associations. Behaviorism has played a significant role in education, particularly in the development of behavior modification techniques. As, an experiment of Pavlov on dogs, he provides conditions in it. He combined the bell and food. He rang the bell and salivation was produced. The purpose of this experiment was to examine how higher animals' brains adapt to their external environment using salivary conditioning. So, external stimuli are conditions, and they impact the behavior. Similarly, the operant conditioning theory proposed by B.F. Skinner. In addition, he taught behavior through rewards and encouragement. Animals and humans have also been the subjects of his experiments.

Cognitivism:- Cognitive theory suggests that the human mind is like a computer that is constantly processing and encoding data. According to cognitive theory, when a person experiences stimuli his mind will look toward prior schema. Prior schemas are small sets of information already present in the mind, and when similar information is added, the schema is formed. This process was referred to as accommodation by Piaget. It emphasizes the importance of mental processes, such as perception, memory, and problem-solving, in learning. It posits that learning occurs through the acquisition and manipulation of knowledge, which can then be applied to new situations.

Constructivism is based on the idea that people actively construct or make their own knowledge and that reality is determined by their experiences as learners. And learners use

their previous knowledge as a foundation for building new things that they learn. It emphasizes the importance of learners' prior knowledge, experiences, and beliefs in shaping their learning. This perspective emphasizes the importance of learners' active engagement, collaboration, and reflection in constructing their knowledge and understanding. In this theory, students construct their own meaning, they are independent learners and teachers play a facilitator or guide role.

Humanism is a paradigm and pedagogical approach that believes learning is viewed as a personal act to fulfill one's potential. In this theory, the teacher's role is to be a role model. A teacher is also expected to provide a reason and motivation for each task. While the role of the student is to explore and observe. This perspective emphasizes the importance of the individual's subjective experiences, feelings, and self-concept in the learning process. It posits that learners are motivated to learn and reach their full potential when their emotional and psychological needs are met. Furthermore, it also emphasizes the importance of creating a supportive, positive learning environment that fosters learners' autonomy, self-esteem, and self-actualization.

Topic 039

The Nativist Perspective Noam Chomsky:-

The nativist perspective, as articulated by linguist Noam Chomsky, holds that Infant is born with complete world knowledge. They have a concept of physical objects in a language. Youngsters learn an extremely complex system smoothly in a short period. This perspective argues that language acquisition cannot be solely explained by environmental factors such as input and reinforcement but must also be attributed to the genetic and neurological factors that enable the language acquisition process.

Nativism theory asks a question, do youngsters who are born deaf learn a needy language at a level that is higher than the level they can hear? The answer is that they hear a string (sequence) of words and infer the utterances and syntactic rules of language.

Fodor's learning inconsistency: He said that one learns something only if he/she knows it in advance. So, to learn a language you must know the language in advance. Nativism in the case of language, infants are born with a universal grammar (UG)- a database of grammar language acquisition device (LAD), which is a hypothetical cognitive mechanism that allows us to unconsciously acquire language. According to this theory, the LAD contains a set of universal grammar rules that are present in all languages, and that children use to learn the specific grammar of their native language. Nativism believes that

the child is born with a LAD and UG, he doesn't have anything to imagine if the child is born with a UG and no LAD, and he cannot hypothesize about the language.

Topic 040

Ideas of Noam Chomsky:-

Who is Noam Chomsky? Noam Chomsky is a renowned American linguist, philosopher, and political activist, born on December 7, 1928, in Philadelphia, Pennsylvania, U.S. He is one of the most influential thinkers of the 20th century and has made significant contributions to the fields of linguistics, psychology, and political theory. He is an American theoretical linguist whose work from the 1950s revolutionized the field of linguistics by treating language as a uniquely human biologically based cognitive capacity. Knowledge of the internal structure of the human mind problem of how this knowledge is acquired. In this regard, we need to read anatomy and other knowledge.

Many people believe that Chomsky claims that language is innate and that there is a universal grammar. This is infact, an incorrect interpretation of Chomsky's theory.

Universal Grammar is a question of how language is acquired, based on universal principles of language. Chomsky proposed that humans have an innate capacity for language acquisition, which he called Universal Grammar. According to Chomsky, there are certain linguistic structures that are hard-wired into the human brain, and children acquire language effortlessly because they are born with this knowledge. Chomsky also wrote that UG is a system of principles and conditions. He found through his studies, that humans have a language acquisition device that other animals do not have. When exposed to language, a child will acquire that language whereas an animal will not. Hence, Chomsky wrote that UG is the system of principles condition.

Topic 041

Behaviorist Perspectives / Behaviorism B.F Skinner:-

Who is B.F Skinner? Burrhus Frederic (B.F.) Skinner was an American psychologist. He was born on March 20, 1904, in America and died on August 18, 1990. In terms of his personality, he has a lot of characteristics. He was a psychologist, behaviorist, author, inventor, and social philosopher. Basically, he was a professor of psychology at Harvard University from 1958 until his retirement in 1974. He has also worked in other countries such as Susquehanna, Pennsylvania, U.S, and Cambridge,

Massachusetts. He is also best known for his influential work on the principles of operant conditioning and behaviorism.

Behaviorism B.F Skinner: He proposed the theory of Operant conditioning. The history of the individual, rather than anatomy, provides the most useful data or information for predicting and controlling human behavior. The behaviorist approach was developed by B.F. Skinner believed that behavior is determined by the consequences that follow it. Skinner's work focused on the principles of operant conditioning, which involves shaping behavior through reinforcement and punishment.

Skinner's Scientific Behaviorism: People generally do those things that have pleasurable consequences and avoid doing those things that have punishing consequences. Skinner proposed that all behavior is learned through the consequences that follow it. If a behavior is followed by a positive consequence, such as a reward or reinforcement, the behavior is more likely to be repeated in the future. On the other hand, if a behavior is followed by a negative consequence, such as punishment or the removal of a positive stimulus, the behavior is less likely to be repeated in the future.

Skinner has also done experiments on animals and humans as well. He experimented on the cat and confined her in a cage. Cats are rewarded with food pellets when they open cages with their feet. This experiment was repeated and the timing of opening the cage was minimal, and again she got a reward in the form of a food pellet. Similarly, a teacher rewards students for good behavior each week in the teaching-learning environment. It can be in the form of intrinsic and extrinsic. In addition, punish any students who exhibit negative behavior in the classroom. Therefore, prediction, control, and description are possible in scientific behaviorism because behavior is both determined and lawful. There is also conditioning. B.F Skinner called it operant conditioning (Skinnerian conditioning) Skinner also proposed that behavior is not caused by internal mental processes but is instead shaped entirely by external environmental factors. He argued that by manipulating the environment, it is possible to shape any behavior, regardless of an individual's innate tendencies or predispositions.

Lesson No. 8**LANGUAGE DEVELOPMENT IN VIEWS OF PSYCHOLOGISTS****Topic 042****Generative perspective:-**

Noam Chomsky is the proponent of the Generative perspective. The rules determine the structure and interpretation of sentences that speakers accept as belonging to the language. The generative perspective is a theoretical framework within linguistics that emphasizes the innate ability of humans to generate an infinite number of sentences using a finite set of rules. Noam Chomsky and his followers argue that humans possess a unique cognitive capacity for language that is not shared by other animals.

According to the generative perspective, all human languages share a set of universal grammar rules that are hardwired into the human brain. These rules allow humans to create and understand an infinite number of sentences, even if they have never heard those particular sentences before. The generative perspective emphasizes the creativity and flexibility of language and argues that humans can use language in novel and innovative ways.

Theory of competence: A model of a psychological system of unconscious knowledge that motivates or inspires a speaker's ability to produce and interpret utterances in a language. Generative grammar claims to be a theory of cognitive psychology and a model of the psychology of language. It also explains descriptive rules of how people perceive and speak correctly. It also claims that use whom not who.

Generative grammar was welcomed widely in the start as a way of formalizing the hidden set of rules a person knows. When they know their native language and produce grammatical words/sounds. However, Chomsky has repeatedly rejected that interpretation. One of the key tenets of the generative perspective is the idea of competence versus performance. Competence refers to the idealized knowledge that a speaker has about their language, including their knowledge of grammar and syntax. Performance, on the other hand, refers to the actual use of language in real-world situations, which can be influenced by factors such as context, social norms, and cognitive limitations.

Topic 043**Constructive Perspective:-**

Introduction: The 21st-century classroom is filled with an exciting collection of learners. Students come from different types of socioeconomic backgrounds, with cultural experiences, and learning styles. These dynamics and vibrant create a challenge for teachers. This means that 21st-century classrooms do not operate passively. There is a lot of activity, and it is very different. Also, teachers mostly adjusted to the levels of the pupils.

Meaning of Constructivism: The meaning of construction is to construct or build something. Constructivism is a rather heterogeneous idea. Students invent their own concepts and ideas, linked to what they already know (previous knowledge). This meaning-making theory of learning is called Constructivism. Knowledge is constructed by learners through active engagement and participation, a mental process of development. The constructive perspective in language development posits that children play an active role in the acquisition and development of language, rather than being passive recipients of linguistic input. According to this perspective, children use their own cognitive and problem-solving abilities to make sense of the language they hear, actively constructing their understanding of language as they engage with the world around them. Hence, students construct new knowledge and, their own meanings, and develop new concepts based on their experiences. He will be more creative in this regard. Creativity is the art of self-directed learning. And learners are the builders and reactors of meaning.

Definition of Constructivism: According to Brader-Araje and Jones (2002), Constructivism can be defined as “the idea that development of understanding requires the learner to actively engage in meaning-making.” So, a teacher needs to actively engage learners in making and constructing the meaning. It can only be done when students learn and experience it independently. Here the role of the teacher is guide and facilitator. When we invent our concepts and ideas, linked to what we already know. This meaning-making theory of learning is called Constructivism. Piaget called it schema and adjustment of knowledge is called accommodation.

Varieties of Constructivism:

- Educational Constructivism
- Philosophical Constructivism
- Sociological Constructivism

Constructivism in teaching: Constructivism teaching is based on the belief that learning follows as learners are actively involved in a process of meaning and data construction. The constructive perspective in language development suggests that children are active participants in the process of acquiring and developing language and that the quality of their interactions with their environment plays a crucial role in this process. Research has shown that children who are exposed to more complex language input from an early age tend to have more advanced language skills later. However, the constructive perspective emphasizes that it is not just the quantity of language input that matters, but also the quality of the interactions that children have with their caregivers and other individuals in their environment.

Topic 044

Language Development in Views of Psychologists:-

Language development has been studied by psychologists from various perspectives. Here are some of the views put forward by notable psychologists in the field:

- 1- **B. F Skinner:** He says that language develops using reinforcement. Sounds, words, and phrases are uttered by the behavior with words of praise or treats to continue the behavior (learning of language). B.F. Skinner also believed that language development is primarily influenced by environmental factors, particularly through a process called operant conditioning. According to this perspective, language is learned through reinforcement and punishment of verbal behavior.
- 2- **Noam Chomsky:** He says that infants are given a neurological construct referred to as the language acquisition device (LAD) that makes infants ready to learn a language. Language develops if the infant is exposed to it. He proposed that language development is primarily innate and that humans have an inherent ability to acquire and develop language.
- 3- **Social pragmatic views** emphasize the child's active engagement in learning a language is very important. The child seeks information, memorizes terms, and imitates. The speech is heard from others and learns to conceptualize using words for the acquisition of language.

Many argue that all three of these dynamics foster the acquisition of language. At birth, infants exhibit two emotional responses such as attraction and withdrawal. They show attraction to pleasant situations that bring comfort, stimulation, and pleasure. (For example; attraction of mothers with children and love from their caregivers). And they

withdraw from unpleasant stimulation such as bitter flavors or physical discomfort. At around two months, infants exhibit social engagement in the form of smiling as they respond with smiles to those who engage in their positive attention. Pleasure is expressed as laughter at 3 to 5 months of age. Displeasure becomes more specific fear, sadness, rejection, or anger between ages 6 and 8 months. Psychologists have put forward various perspectives on language development, including behaviorist, nativist, interactionist, and cognitive perspectives. Each perspective emphasizes different factors in language development, including environmental factors, innate abilities, social interaction, and cognitive processes.

Topic 045

Piaget's View of Cognitive Development:-

Jean Piaget's theory of cognitive development suggests that intelligence changes as children grow. Similarly, language develops with the passage of time (from birth to adult age). A child's cognitive development is not just about acquiring knowledge, he/she has to construct a mental model of the world that helps him to understand the world, learn the language, and also assist him in recognizing his environment. Cognitive development occurs through the interaction of innate capacities and environmental events, during the stage of development. **Piaget's theory proposes 4 stages of development.**

- 1- Sensorimotor Stage (0-2 years)
- 2- Pre-operational Stage (2-7 years)
- 3- Concrete Operational Stage (7-12 years)
- 4- Formal Operational Stage (12 years and up to 18)

The details of each stage are mentioned below:

- **Sensorimotor Stage (0-2 years):** In this stage, infants learn through their senses and movements. They develop object permanence, the understanding that objects continue to exist even when they cannot be seen, heard, or touched.
- **Pre-operational Stage (2-7 years):** At this stage, children are also egocentric and possessive. In this stage, children begin to use symbols, such as words and images, to represent objects and events. However, they still struggle with logical reasoning and have difficulty taking another person's perspective.
- **Concrete Operational Stage (7-12 years):** In this stage, children become a little bit more mature/imaginative and begin to think logically and understand cause-

and-effect relationships. They can perform mental operations on concrete objects and ideas. These children have no ability to understand the concept of conservation. The meaning of conservation here refers to relying on the quantity rather than the quality, for example, infants believed that the same amount of water in the glass and the same amount in the plate are different. Water in a glass (has a height) is higher than that in an oblique or flat object.

- **Formal Operational Stage (12 and up to 18 years):** In this stage, adolescents and adults can think critically, abstractly, and hypothetically. They can reason about complex ideas and concepts. These children become mature enough and do not perceive things as they exist.

The sequence of the stage is universal across cultures and follows the same (unchanging) order. All children go through the same stages in the same order (but not all at the same rate) however, the rate of learning language is different.

How did Piaget develop the theory?

Piaget was employed at the Binet Institute in the 1920s, where his job was to develop French versions of questions of English intelligence tests. He became interested because of the wrong answers of children gave the questions that required logical thinking. He believed that these wrong answers revealed important differences between the thinking of adults and children. Piaget made his own new set of assumptions about children's intelligence. Piaget's theory emphasizes the importance of active learning and exploration in cognitive development. He believed that children are active participants in the process of constructing their understanding of the world, rather than passive recipients of information. His theory has had a significant impact on the field of developmental psychology and has influenced the design of educational programs for children.

Topic 046

Vygotsky's Social Development:-

Vygotsky was a Russian psychologist. The ideas he possesses belong to B.F. Skinner as well. At the age of 38, he died of an early death. About the theory, Vygotsky placed more emphasis on social contributions and interaction to the process of language development. He focused on the connections between people. The sociocultural context in which they act and interact in shared experiences.

Social interaction has been given more attention by Vygotsky. His interests in Psychology were quite diverse, but often focused on topics of child development and

education. He has also explored such topics as the psychology of art and language development. Social Interaction Vygotsky felt social learning anticipates development. He states every function in the child's cultural development appears twice. Inter-psychological refers to a relationship between people, and intra-psychological refers to the relationship between a child and his or her environment. He believes that young children are curious and actively involved in their learning and the discovery and development of new understandings.

Vygotsky's theory of social development emphasizes the important role of social interactions in the language development of a child. According to Vygotsky, children learn language through social interactions with more knowledgeable others, such as parents, teachers, and peers. He believed that language development is not just an individual process but is shaped by cultural and social factors. Vygotsky's theory emphasizes the importance of social interactions, cultural context, and the role of language in cognitive development. According to his theory, language development is not just a cognitive process but is shaped by social and cultural factors.

Topic 047

Noam Chomsky (psycholinguistics):-

Noam Chomsky was born on December 7, 1928, in Philadelphia. He was an American theoretical linguist whose work from the 1950s revolutionized the field of linguistics by treating language as a unique human, biological-based cognitive capacity, or development. The best-known Noam Chomsky contribution to psychology is the concept of universal grammar. It states that language is innate, or inborn, instead of learned, as is believed in behaviorism theory. So, the Noam Chomsky theory is opposite to the theory of Behaviorism. B.F. Skinner believed that behavior can only be developed through reinforcements.

A Noam Chomsky psychology theory includes the impact on language that linguistics should be included in cognitive psychology. Noam Chomsky promoted the theory of universal grammar which suggests that language is innate or inborn and is processed through the brain's pre-existing mechanism (LAD).

More precisely as far as the relationship between the human brain and development, Chomsky believes learning takes place through a mechanism in the brain, subsequently, language learning is generated by the environment. Chomsky theorizes that linguistics fits into cognitive psychology because it is the result of mental processes. Chomsky even

declares a baby has a language Acquisition Device or LAD that allows them to learn a language quickly and complex sentences as well. The LAD is a cognitive mechanism that is responsible for the rapid and effortless acquisition of language in young children. According to Chomsky, the LAD is programmed with a set of universal grammar rules that are common to all human languages.

Many Scholars view Chomsky's views as siding with the French philosopher Rene Descartes instead of B.F Skinner. They see American psychologist B.F Skinner as siding with English philosopher John Locke instead.

Chomsky's theory has had a significant impact on the field of linguistics and has influenced the study of language development in children. His theory emphasizes the importance of innate abilities and biological factors in language acquisition, rather than just environmental factors.

Lesson No. 9

LANGUAGE DEVELOPMENT STAGES -1

Topic 048Gender:-

Gender: Participants will have a sound understanding of gender concepts and terminologies.

Definition of Gender: Gender refers to those characteristics and roles of women and men that are socially constructed.

What is Gender about: Social roles and relations between men and women in society. Gender roles are very important in our society and also their relations are also associated with the values of the society. In any society, values and preferences are different. So, it can vary from society to society.

Difference Between Sex and Gender: Sex refers to biological roles for example a child is born with the biological factors (male and female). Gender refers to those roles that are provided by society as male and female. There can also be differences between these roles. The concept of gender affects all parts of our lives (social, economic, and political). For example: **The concept of male and female is not equal in our society.** In terms of respect, their roles are also different. As the female gets more respect than males. **Economic impact: There is a difference in earnings and wages between men and women, as well as in economic status.** Women did not have the right to vote for political parties in the early days, which had a direct impact on their economic standing. The concept of gender also changes over time. It is what we expect men and women to do and behave. It is about how power is used and shared.

Gender Equality: Entails the concept that all human beings, both men and women, are free to develop their personal abilities and make choices without stereotypes, rigid gender roles, or prejudices. Gender equality means that the different behaviors, aspirations, and needs are both considered valued and favored equally. It does not mean that women and men have to become the same, but that their rights, responsibilities, and opportunities will not depend on whether they are born male or female. Moreover, in modern times the concept of sex (male and female) does not affect the roles, responsibilities, and opportunities of gender.

Additionally, gender stereotypes can also influence the types of activities and toys that children are exposed to, which in turn can affect their language development. For

example, girls may be more likely to play with dolls and engage in nurturing activities, while boys may be more likely to play with trucks and engage in rough-and-tumble play. These different activities can influence the types of language and communication skills that children develop.

Topic 049

Language Development Stages:-

Language development is a remarkable journey that individuals pass through from infancy to early childhood.

Stages of Language Development

- Pre-Linguistic Stage
- First year of life of the child
- Development of gestures
- Making adequate eye contact
- Cooing, babbling and crying
- Two-word stage
- Telegraphic stage
- Multi-word stage

Now, let's examine each of these stages individually and explore them in greater detail.

Prelinguistic Stage:-

- The initial phase where infants communicate using cries, coos, and babbling. This stage is crucial because young children communicate without using words. It serves as an important step towards the development of language and is followed by the stage where they begin to form actual words.
- Lays the foundation for later language development by refining motor skills and exposing infants to speech sounds. Language development refers to the progression and refinement of children's communication skills. It involves the development of their motor skills, as well as exposure to various sounds and speech patterns. Further, language development occurs through the process of being exposed to language, and it is characterized by different stages in which children learn and acquire language skills.

Babbling Stage:-

- Occurs around 6-10 months, involving experimentation with different speech sounds and by connecting different syllables.

- Plays a crucial role in refining motor skills, enhancing phonemic awareness, and preparing to produce speech.

Holophrastic Stage:-

- Emerges at 12-18 months, where toddlers use single words to convey complete thoughts, they are capable of expressing their complete emotions and needs using just a single word. In addition, they also demonstrate the ability to identify and name objects that belong to them.
- Marks the beginning of vocabulary development and symbolic communication. Toddlers start naming familiar objects. Afterward, there is a stage where children use two words together, and then they progress to the multi-word stage. In the multi-word stage, children start using complex sentences with more than one or two words to express themselves.

Topic 50

Development of Language in Early Years:-

Language development in early years is a crucial aspect of a child's overall growth. It plays a significant and profound role in a child's life due to its importance.

Importance of Early Language Development:

- **Cognitive Foundation:** Language development serves as a cognitive foundation, influencing other areas of development, including problem-solving and critical thinking.
- **Social Interaction:** Vygotsky was a Russian Psychologist who believed that children learn from social interaction. It is integral to social interaction, allowing children to form relationships, and express needs, and engage them in collaborative activities.

Skills Acquired: The foundation for vocalization encompasses the acquired skills in language development. It also fosters sensitivity to speech sounds, which is crucial for early communication.

- **Language Expansion:** Between 2.5-3 years, language expansion occurs with an increase in vocabulary and sentence complexity.
- **Skills Acquired:** Detailed and meaningful conversations, expanding both receptive and expressive language skills. As a result, this gradual process expands their language abilities over time.

- **Language Refinement:** At the same time, the language becomes refined. Around 3-5 years, children fine-tune language skills, including grammar, pronunciation, and communication strategies.
-
- **Skills Acquired:** Fluency, accuracy, and sophistication in language use. This is due to a significant increase in their vocabulary.

Factors Influencing Early Language Development:-

There are some factors that influence early language development.

- **Genetics:** The first factor is genetics, which is inherited tendencies influencing language abilities and it is inherited from parents and passed on to their children.
- **Environment:** Exposure to a language-rich environment and interactions. When a conducive environment is provided to a child, their language development accelerates, and this stage becomes more firmly established at a quicker pace.
- **Caregiver Interaction:** The role of responsive caregiving in language development. Children who engage in interactions with family members and caregivers experience enhanced language skills and learn language more rapidly.

In summary, we have discussed the various stages of language development, particularly focusing on the stages observed during early childhood. We explored how children acquire language skills during their developmental years and examined the factors that can impact their language development.

Topic 051

Stages of Language Development:-

Language development in children can be broadly divided into several stages. Each stage is characterized by specific language skills and milestones that children typically reach during that stage. The stages of language development in child language development are:

- 1- **First stage (Cooing):** It is also called pre-linguistic stage. It occurs with zero and 6 months. Children in this phase don't have speaking or language skills. So, they communicate with sounds like cooing.
- 2- **Second stage (Babbling):** Children's language development happens between the age of 6 and 9 months. Children begin to babble, making noises and syllables

that aren't yet words. For example: ma-ma, pa-pa, etc. They also begin to understand simple words and phrases, such as their own name or "no".

- 3- **Third stage: Single word/Holophrastic:** This stage usually happens between the ages of 9 and 18 months. During this stage, their language skills usually increase enough to say single words that describe objects or their basic needs. Children begin to use words to express their needs and desires. They can say simple words like "mama", "dada", and "ball".
- 4- **Two-word stage (18 to 24 months):** The child can speak two-word sentences that usually have some meaning, and they can also express their feelings and needs to their caregivers or relatives and surroundings. They group words that they learned during the holophrastic stage. Some examples may include saying "more food" at the table, "more milk" or "my toy". They also begin to use pronouns and prepositions.
- 5- **Fourth stage (Telegraphic):** This stage occurs between the ages of 24 and 30 months. Children can speak longer phrases. The child can speak more than two to three words at this stage. For example, the cat drinks the milk, I want to go, or Mama gives milk, etc.

Multi-word stage: This stage starts beyond 30 months. Children begin to use more complex sentences and can carry on simple conversations. So, they can communicate better their ideas. They also learn new words at a rapid pace and can understand abstract concepts.

It is important to note that the exact age ranges and specific milestones may vary between children. However, these stages provide a general framework for understanding the progression of language development in children.

Topic 052

Stage 1: Learning Sounds:-

Dear students, I will talk about the language development stage 1 (learning sounds) in this module.

Stage 1 of language development is learning sounds. This stage typically occurs during the first 6 months of a child's life. During this stage, infants begin to develop their ability to hear and distinguish sounds. Infants can distinguish between different vowel and consonant sounds, even if they are not from their own language. This stage 1 (learning sounds) is also called the pre-linguistic stage.

- **Crying:** After birth to 2 months, a child starts crying and they produce sounds through their vocal throats without being aware of it.
- **Cooing:** After 5 months, a child is able to produce vowel-like sounds.
- **Babbling:** This stage occurs between 6-9 months. A child starts babbling at this stage or syllables like sounds (ba-ba-ba, ma-ma-ma). The sound production period goes through the year. During the first year of life, the child is in a Pre-speech stage. It is also important that the developmental aspects related to speech would include the development of gestures. Making adequate eye contact, sound wordplay between infant and caregivers, cooing, babbling, and crying. Examples of such pre-school sounds would be dada, dada, mama, mama, and waah.

When babies are born, they can hear and distinguish all the sounds (e.g., pleasure or anger) in all the languages in the world. That's about 150 sounds in about 6500 languages, though no language uses all of those sounds. The sounds a language uses are called phonemes. The English has about 44 sounds (vowel and consonant). Some languages use more and some fewer sounds. Babies learn which phonemes belong to the language they are learning. The ability to recognize and produce those sounds is called "phonemic awareness" which is important for children learning to read. The best way to promote language development for babies is simply to talk to your child. Babies learn by experiencing (and listening to) the world around them. The more language they are exposed to the better. Additionally, you can put words to their actions. Talk to them as you would in conversation, pausing for them to respond, and then you can say back what you think they might say.

Research has shown that infants' exposure to language and sounds in their environment can impact their language development during this stage. Infants who are exposed to more speech and language from their caregivers tend to reach language milestones earlier than those who are not. Additionally, infants who are exposed to a variety of sounds and languages may have an easier time distinguishing between sounds in their own language later on. The learning sounds stage is an important first step in a child's language development. It sets the foundation for later language skills, such as word recognition and speech production.

Lesson No: 10

LANGUAGE DEVELOPMENT STAGES - 2

Topic 053Stage 1: Learning Sounds Birth, 4 Months, 6 Months:-

This stage begins at birth and continues until around 6 months of age. At birth, infants can hear and recognize sounds in their environment. They can differentiate between their mother's voice and the voice of a stranger. However, they cannot produce sounds themselves.

- **By 2-3 months**, infants begin to coo and make vowel-like sounds. These sounds are often accompanied by facial expressions and gestures, such as smiling or waving arms. Infants may also begin to imitate sounds they hear, such as coughing or sneezing.
- **By 4-6 months**, infants begin to babble, which is the production of repetitive consonant-vowel syllables, such as "ba-ba-ba", "ma-ma-ma", and "da-da-da". These sounds are often used in play and communication with caregivers. Also, these sounds are produced voluntarily and involuntarily through their vocal cavity. Babbling is experience-expectant learning. All babies babble and gestures or facial expressions.

The sounds they make are similar no matter what language their parents speak. And during the babbling, the child speaks syllables (one, two, three, etc.) Over the next few months, babbling incorporates sounds from their native language. Even untrained listeners can distinguish between babbling and infants. Those children who have been raised in cultures in which French, Arabic, or Cantonese (Cantonese is a language spoken by 60 million Chinese) languages were spoken. So, a child acquires the language according to their native and culture as compared to English or other languages.

The environment plays an important role in the language acquisition process. A newborn baby learns sounds or language according to the provided social discourse. Many cultures assign important meanings to the sounds baby's babble: "ma-ma-ma, pa-pa-pa" are usually taken to apply to significant people (caregivers, relatives etc.) in the infant's life. It is important to note that every child's development is unique and may progress at different rates. However, the learning sounds stage is an important foundation for later language development. Infants who are exposed to a variety of sounds and languages

during this stage may have an easier time distinguishing between sounds in their own language later on.

Topic 054

Stage 2: Learning Words:-

Stage 2 of language development is learning words, which typically occurs between the ages of 12 to 18 months. During this stage, children begin to understand and use words to express themselves. Some of the milestones of this stage include:

One-word stage (Holophrastic): An infant's maximum sentence length is one word at this stage. The words are: Naming objects, events, and people in the child's immediate surroundings. Only one word is simple in pronunciation but concrete in meaning. For example, milk, mommy, doggie, etc. So, this one word gives complete and comprehensive meaning.

Pre-school years: They know about 50 words and most children progress to a stage of two-word combinations.

Two-word stage: A word in the two-word stage without grammatical modifications. For example, doggie mommy milk. Two-word utterances express the following: Examples to ask for more milk say no to something no milk Notice something hi doggie Notice something disappeared no cookie. Two-word stage experimenting with many binary semantic-syntactic relations. Because they don't have any sense of use and principles of grammar. But it starts as they grow.

Research has shown that children's exposure to language and interactions with caregivers during this stage are crucial for their language development. Children who hear more language and receive more responsive feedback from their caregivers tend to have larger vocabularies and more advanced language skills. The learning words stage is an exciting time as children start to communicate their wants and needs through language. It sets the foundation for future language development and learning.

Topic 055

Learning Words 8 Months, 12 Months, 18 Months:-

Dear students, I will talk in detail regarding the language development stage 2 (learning words) in this module.

At about 7-8 months of age, infants readily learn to recognize new words and remember them for weeks. At 8 months, infants can recognize familiar words and may

start to respond to their own names. They can also understand simple words such as "no" or "bye-bye" and may begin to use gestures to communicate, such as pointing to objects they want.

At 6 months, if an infant hears either "mommy" or "daddy", they look toward the appropriate person. Infants gradually come to understand the meaning of less frequently heard words. The pace is going to vary from child to child.

At about 10 months, children understand about 11 to 154 even though they may not be able to say these words. By their 1st birthday, infants usually say their first words, usually an extension of babbling or refinement in their language.

By the age of 2 most children have a vocabulary of a few hundred words, and by age 6 the vocabulary includes over 10,000 words. Approximately 1500 words are learned by children each day, according to American research.

The importance of Symbols: Children begin using gestures, which are symbols shortly before their first birthday. Gestures, words, and syllables convey a message equally. Well, sometimes gestures pave the way for language. In one study, 50% of all objects were referred to first by gesture and, about 3 months later, by word. After children know the objects have names, a gesture is a convenient substitute for pronouns like "it" or "that" and often causes the adult to say the object's name. A child's name for everything. Once an infant's vocabulary reaches about 50 words it suddenly begins to build rapidly, at a rate of words per month, mostly nouns. This language spurt occurs around 18 months and is sometimes called the Naming explosion.

At 18 months, children's vocabulary grows rapidly, adding 1-2 new words to their vocabulary each week. They can understand and follow more complex directions and can use words to form simple phrases, such as "want milk" or "bye-bye dada." They may also start to ask simple questions, such as "What's that?" or "Where's mama?"

Topic 056

Stage 3: Learning Sentences:-

It typically occurs between the ages of 2 to 3 years old. During this stage, children start to combine words into phrases and sentences to express more complex ideas and thoughts. Some of the milestones of this stage include:

As part of language development, a child will begin to use;

- Two-word sentences at around two years.
- **By age three**, they'll be able to use sentences within three or more words. For example, "Mummy get in the car" or "Me go too". They also start to **hear grammar and more structured sentences**. For example; instead of "I go" a child might say "I am going".
- **Children also use the past tense** at this stage. For example; "walked", "jumped". And they'll start using plurals like "cats", "goats", or "horses". A child might not always get it right when they use **plural and past tense**.
- **A complete sentence has two components**, a subject and a verb. The subject and verb must form a complete thought to be considered a simple sentence. The addition of an object can also modify the meaning of the sentence. For example: "The couple dances".
- A sentence that contains two simple sentences joined by a conjunction is called a **compound sentence**. A **conjunction** joins words, phrases, and clauses together in a sentence. Conjunctions for and nor but yet so.
- **Compound Sentence:** The comma in a compound sentence is placed before the conjunction. For example, Andy built a snowman, and Jeff played with his dog.
- **Sentence Structure:** Compound Sentence where would you place the comma in the following sentence? For example, Dan struggled with his homework so his father helped him. Dan struggled with his homework, so his father helped him.
- **Pattern for the Compound Sentence:** We see these as sentences with a pattern. The placement of commas can change the meaning of the sentences. For example; He journeyed a long way, for his home was across the ocean. Dan struggled with his homework, so his father helped him, I built a very strong boat, yet it still sunk to the ground.

Topic 057

Stage 3: Learning Sentences 24 Months, 30-36 Months, Beyond 3 Years:-

Learning sentences typically occurs between the ages of 24 months to beyond 3 years. During this stage, children begin to use words to form more complex sentences to express their thoughts and ideas. Most children begin to combine words into simple sentences by 18 to 24 months of age. Children's first sentences are two-word combinations referred to as Telegraphic speech. Words directly relevant to meaning. Words not critical to the meanings are left out-similar to the way telegrams were written. Therefore, a child

can only speak those sentences that have meanings otherwise less sentences will be neglected.

Kinds of words:

- Function words: a, the, in
- Auxiliary (supporting) words: is, was, will be
- Word endings: plurals, possessives, verb tenses
- Telegraphic speech: Two words utterances (sounds)

A child usually deals with everyday events, things, people or activities and explains them in sentences by using the words. As it is an important phase for language development and child needs more attention and care from his/her caregivers. Word order usually reproduces to what the child hears. For example, “More cookie”, “Mommy goes”, “Daddy juice”, “Sue dogs”, etc. These sentences are brief and to the point, containing only vital information.

At about 2 ½ years of age, children can produce more complex sentences (four or more words per sentence). Longer sentences are filled with grammatical morphemes (syllables, sounds) words or endings of words that make sentences more grammatical. **A 1½-year-old might say** “” kick ball” but a 3-year-old would be more likely to say “I am kicking the ball”

Over regularization: Speech errors in which children treat irregular forms of words as if they were regular. Applying rules to words that are exceptions to the rule. This leads young children to talk about foots, teeth, sleeps, sheep’s and mouse. Although technically wrong, Over-regularization is a sign of verbal superiority because it shows children are applying the rules to grammar. Between 3 and 6 years of age children learn to use negation. For example, “That isn’t a butterfly”. Children also learn to use embedded sentences. For example, “Jennifer thinks that Bill took the book”. Children begin to comprehend passive voice as opposed to active voice. Such as; “The ball was kicked by the girl” as opposed to “The girl kicked the ball”. By the time most children enter kindergarten or primary, they use most of the grammatical forms of their native language with great skill.

Lesson No. 11

LANGUAGE DEVELOPMENT STAGES - 3

Topic 058Conclusion:-

All children learn language in the same pattern. There are stages of language development. When they learn to speak, understand, and communicate. They follow a normal sequence of milestones. Individual children develop language skills at their own pace.

Stage 1 is the initial phase of language development. Infants learn to distinguish and produce different sounds through babbling and vocal play. The foundation of phonemic awareness and speech production. Infants are exposed to various linguistic sounds in their environment. Shape their understanding of phonemes.

Stage 1: Learning Sounds Children are able to differentiate between sounds and ability to produce them accurately. Stage 1 makes the basis for language acquisition. To prepare for vocabulary development. It involves the acquisition of word vocabulary. Children begin to understand and use words to name objects, actions, and concepts.

Stage 2: Learning Words They expand their vocabulary through exposure to spoken and written language. Children learn words through repetition and interactions. They recognize words, and skills, and begin to link words with meaning. This stage is crucial for building a solid word foundation and understanding basic linguistic concepts.

Stage 3: Learning Sentences Stage 3 focuses on the development of sentence structure and grammar rules. Children combine words to make simple to complex sentences. They learn and acquire syntax and rules for sentence-making. Gradually learn to apply them in their speech and writing and also refine their language skills.

Learning Sentences: They gain fluency, accuracy, and ability to communicate more effectively.

Implications for Educators and Parents:

Educators and Parents need to provide the following implications to children:

- Language-Rich environments
- Meaningful Interactions
- Promoting Vocabulary and Sentence Development
- Modeling/Imitate and Feedback
- Individualized Support

It is important to note that the timeline for language development may vary among children, and some may reach these milestones earlier or later than others. Additionally, children's language development is influenced by a range of factors, including genetics, environment, and culture. Overall, understanding the stages of language development in children can help caregivers and teachers provide the support and guidance needed for children to develop strong language skills and reach their full potential.

Topic 059

Development of Words in Toddler's Communication:-

A **toddler** is a young child, usually defined as being between the ages of one and four. **Toddler development** refers to the change that occurs in children aged between 1 and 4 years. Change may occur as a result of genetic processes known as maturation, or may be due to environmental factors and learning. Learning belongs to the behavior modification. It can be done through self-learning, environment, and efforts from parents, etc. But its base is genetic processes such as; intelligence, word speed, or maturity in learning language, etc.

Usually, the **development of words** involves interaction between the two class fellows, peers, friends, father-child, mother-child, etc. Early language development is characterized by single-word utterances, then two-word utterances, and by early multi-word combinations. Learning strategies may differ from children who produce individual words mostly nouns to those who produce unanalyzed phrases. These phrases called formulas represent a whole-to-part strategy of learning that seems to be less efficient than learning words and building to longer utterances. First words fill the intentions previously served by gestures or vocalization. A toddler's first word most often occurs around 12

months. Around 12-18 months of age, toddlers typically begin to use one or two words to convey entire thoughts or ideas, which is known as the telegraphic stage of language development.

The child will then continue to steadily add to his or her vocabulary until around the age of 18 months when language increases rapidly. He or she may learn as many as 7-9 new words a day. Around this time, toddlers generally know about 50 words.

At 21 months is when toddlers begin to incorporate two-word phrases into their vocabulary such as “I go”, “mama give” and “baby play”. All these sentences give complete information, but the grammatical rules are not followed. Before going to sleep they often engage in a monologue called crib talk in which they practice conversational skills.

At this age, children are becoming very proficient at conveying their wants, feelings, and needs to their parents. The development of words and vocabulary is an important aspect of toddler's language development, as it allows them to express themselves and interact with others more effectively. Parents and caregivers can support this development by talking to toddlers frequently, using simple words and sentences, and encouraging them to practice their language skills in a variety of contexts.

Topic 060

Single Word Utterances:-

The one-word stage, as the name implies. The stage in which children speak mainly in single words. For example, during the one-word stage, a child isn't yet able to say “I want milk” so they say “milk”. A child just says one word to convey his meaning and names the things. This stage occurs from about age 1-2 and then gives way to the two-word stage. Without completing the first stage, it is impossible to cover the second stage. Therefore, the acquisition of language is a complete process but it varies from child to child.

To utter means “to say”. So, when you are saying something, you are making utterances. A police officer “Stop!” is an utterance. Saying “Good boy!” to your dog is an utterance. It refers to a one-word utterance. Complex ideas are sometimes expressed with a single word, accompanied by gestures and emphasis. For example, depending on the context and how the word is spoken, milk may mean That is milk, I want more milk, or I spilled the milk. It is also called the holophrastic or holophrasis stage.

Example: Interestingly, these one-word utterances can also take the place of a whole sentence, for example when a child sees their father they utter “dada” instigating

the phrase “I see daddy”. They may also say “juice” implying that they would like some juice - “give more juice”

Research in child language development has demonstrated the importance of single-word utterances as a precursor to more complex language. As children begin to understand the meaning behind words, they can use them to communicate with others and make sense of the world around them. For example, a child may say "mama" to indicate they want their mother's attention or "ball" to request a toy.

One study conducted by Nelson and colleagues (1973) found that single-word utterances served as a predictor of later language development in children. The researchers found that children who produced more single-word utterances at 18 months of age had larger vocabularies and more complex sentence structures at 24 months of age than children who produced fewer single-word utterances. Overall, single-word utterances are a crucial aspect of early language development, providing children with the foundational skills they need to communicate effectively and build more complex language skills as they continue to develop.

Topic 061

Pragmatic

The term “**Pragmatics**” was first coined in the 1930s by the philosopher C.W. Morris and developed as a subfield of linguistics in the 1970s. Pragmatics is needed if we want a fuller, deeper, and generally more reasonable explanation of human language behavior.

Pragmatics is a subfield of linguistics that studies the ways in which context contributes to meaning. Pragmatic studies the factors that govern our choice of language in social interaction and the effects of our choice on others. Pragmatics is the study of language as it is used in specific contexts. For example, a child's language and communication patterns at home may differ from those at school or when interacting with friends and colleagues. Consequently, children adapt their vocabulary and word usage according to the specific context. It is important to provide clear and comprehensive names for objects in front of children while ensuring consistency and avoiding the use of multiple names for the same object.

Pragmatics is the study of language which focuses attention on the users and the context of language use rather than on reference, truth or grammar. Pragmatics involves understanding how people use language to convey meaning beyond the literal meanings of

words and how context influences the interpretation and use of language. This includes the use of non-literal language, such as sarcasm or irony, and the ability to understand the social and cultural context in which language is being used. Further semantic information is information encoded in what is uttered, these are stable linguistic features of the sentence.

Pragmatic information is (extralinguistic) information that arises from an actual act of utterance and is relevant to the hearer's purpose of what the speaker is communicating and what is the purpose of the speaker. Pragmatics plays a crucial role in understanding how different terms and concepts are employed in various contexts and when it is appropriate to use them. Without considering pragmatics, a complete understanding may be vague, as sometimes only a pragmatic explanation can provide meaningful sense and clarity.

The following example is borrowed from David Lodge's Paradise News.

"I just met the old Irishman and his son, coming out of the toilet." This conveys the idea that upon exiting the toilet, the speaker encountered the Irish man and his son who were waiting for them. It is important to note that this statement does not imply that there was enough room for both the Irishman and his son inside the toilet.

In conclusion, context plays a significant role in pragmatics as it focuses on the study of language in real-life situations. Within different contexts, the choice of words and sentences varies, considering factors such as timing, events, and dates. This highlights the dynamic nature of language use and the importance of considering the context for accurate interpretation and understanding.

Pragmatics further explains the distinction between two contexts and their respective language styles, as different language styles are employed in different contextual settings. This emphasizes the significance of understanding and adapting to the appropriate language style based on the specific context.

Lesson No. 12

DEVELOPMENT OF LEXICONS AND UTTERANCES**Topic 062****Initial Lexicons:-**

Definition of Lexicon: A book containing an alphabetical arrangement of the words in a language and their definitions as well as presentations. Basically, "lexicon" refers to a collection of words and their meanings within a language. In Urdu, it is called "Lughat". There are various dictionaries such as; oxford, Kitabistan (Urdu-English), Al Munjid (Arabic), and Feroz Ul Lughat (Urdu)

It is a book, in which words and vocabulary are arranged alphabetically, and it also explains the different dimensions and layers of the words such as nouns, verbs, and adverbs. The lexicon of a language includes not only the individual words themselves, but also information about their syntactic and semantic properties, such as their part of speech, inflectional forms, and relationships with other words in the language.

Further, a Lexicon is the vocabulary of a language, an individual speaker or group of speakers, or a subject. They are also called the total stock of morphemes in a language. Morphemes are also called syllables and it is the process of breaking words such as Boy (1 morpheme), short, examination, and beautiful. Therefore, different morphemes and syllables make different words, and then the lexicon explains the various features of words.

In natural language processing, lexicons can be used for tasks such as part-of-speech tagging, named entity recognition, and sentiment analysis. There are many existing lexicons for different languages and domains, and researchers and developers may also create their own lexicons for specific purposes or applications.

The set of all the words and idioms of any language is also called a lexicon. A mental system that contains all the information a person knows about Words in his/her mind. According to psycholinguists, people's knowledge of a word Includes knowing how a word is pronounced, and the grammatical patterns with which a word is used. **For example,** in electronic media and videos, there are various sound masters to guide about the sounds of the words and pronunciations including Urdu, and English (British, Australian, and American). Through these types of videos, a listener can correct his/her pronunciation during the language-learning process.

In addition, the meaning of words encompasses the entire set of words that a speaker possesses in their mental lexicon, which gradually develops over time. At the beginning of the year, children may have a limited vocabulary to express themselves, but as they mature, their repertoire of words and lexicon expands. The Content of the mental lexicon and how a mental lexicon is developed are studied in psycholinguistics and language acquisition.

Linguists use the technical term lexicon instead of the everyday term dictionary. A lexicon has to contain all the root morphemes and all the derived stems since their meaning is normally not entirely predictable. Furthermore, words change over time. Some words may become obsolete and be replaced by new ones, while additional words are introduced into the language. This dynamic process results in the continuous evolution and expansion of vocabulary.

- **Irregular variational forms of words**, such as the irregular forms of be, are and is since these cannot be predicted from morphology. These forms are used in the sentences and help in providing the complete meaning of the sentence.
- **Complex words** like blackboard, strawberry, and penknife. A lexicon is a compilation or inventory of words that is created by language experts, spoken by speakers, or formed within the mind of a language learner.
- **Longer expressions** such as kicked the bucket, known by heart, kill time, and so on all signs whose meaning is not predictable. As this is a long sentence it is not easy to convey its sense. To ensure clarity in conveying meaning, it is important to arrange words and sentences effectively, especially in long sentences. Additionally, there are guiding principles for constructing complex sentences. To conclude, a Lexicon is a dictionary that explains the dimensions of the use of words. It tells us whether it is a single, double, or combination of morphemes.
- **Openness:** The lexicon of a language is not fixed and does not remain that way forever. Lexicons change quite rapidly, new words come into use, and old ones lose popularity and eventually disappear. As you can see spellings of the same thing are different in British and American English. Also, it is noted that some changes are due to social and technological changes.

Topic 063**Meaning of Single-Word Utterances:-**

Single-word utterances refer to the use of one-word expressions by a child to communicate their needs, wants, and ideas. They are a significant milestone in language development and typically emerge around 12 to 18 months of age. Once the combination of morphemes was no longer considered the criterion for the starting point of language. The origin began to be pushed back earlier and earlier. Single-word utterances became a new focus. Language learners acquire words and express them through utterances, while the context plays a crucial role in comprehending the meaning of these words. Single words hold significant importance in language learning and continue to be a subject of great interest in the field today.

The study of word meaning is highly significant during the stage of child language acquisition, especially when learning a second language. Understanding the meaning of words plays a crucial role throughout the language acquisition process. Children primarily learn word meanings from their caregivers, such as parents and siblings, as well as through the various stages of language development. This learning process is further facilitated by the inborn capacity known as the Language Acquisition Device (LAD). Subsequently, children interact with their environment to reinforce and expand their understanding of word meanings.

Let's explain with some definitions and descriptions of words.

- Including when is a word developed word and when should we say that a child is using a **“real word”**. Hence, it is crucial to take into account the use of real words by a child as an indicator of their language development level. Various researchers have employed different criteria and approaches to study this aspect of language development.
- The **same utterance is used consistently to signal the same meaning** to name the same things. It is essential to assign a single, consistent name to each object to prevent ambiguity and confusion in the minds of learners. Providing consistent labeling fosters clarity and aids in effective language acquisition.
- It is similar to the sound of the conventional words used by adults. Language learners comprehend words and their meanings through exposure to adult speech, even before they can speak those words themselves. Over time, they begin to vocalize these words based on their own needs and interests. These words are

acquired from their environment and caregivers, who serve as primary sources of language input and learning.

- It is spoken with the intention to communicate (not just in imitation of what an adult has just said).
- Word utterance is used in a variety of settings, and to name items the child has not heard other names. It is important to provide and explain complete names to the objects in front of the child and also avoid to giving different names to a particular object.
- Distinctions have been drawn among “proto words” invented rather than words from the adult language but seem to have consistent meanings.
- Single-word utterances are also called “**context-bound words**”. They are also used only in a single context. In “Real words” Context-free; is used to label categories rather than particular objects in a single context.

Overall, single-word utterances are an important stage in a child's language development as they signify the beginning of their ability to express themselves and communicate their needs and wants effectively. Moreover, the pronunciation of the child and adult may change due to the specific context, but the meaning of the word will remain the same. The use of single-word utterances is crucial in language development because it marks the beginning of a child's ability to communicate effectively through language. As they continue to develop, children will begin to combine words to create more complex phrases and sentences.

Topic 064

Early Multi-Word Utterances:-

The stage of language development where a child starts using multiple words to communicate typically occurs between 24 to 30 months of age. It generally begins around the age of 30 months, which corresponds to two to two and a half years, and during this time, children gradually increase their vocabulary and begin to express themselves using a greater variety of words.

This is a stage in which they **speak two words together**, after which when they grow from this age i.e. from 24 months to 30 months, they go to the stage of multi-word utterances in which they start speaking complex sentences and they demonstrate their needs and emotions. These sentences are relatively simple sentences, yet the sentences they

are not very difficult sentences simple sentences like “doggy, go back or bus going” etc. are sentences like that which are sentences that meaning conveys are in the multi-word stage but still they are simple words and simple sentences. That's why they demonstrate the lexicon of the child, that is, the vocabulary of the child is the dictionary in their mind, rather than grammatical understanding.

During the stage of multi-word development, children demonstrate their growing language proficiency by **expressing their thoughts, emotions, and interests through the use of multiple words**. At this stage, their focus is primarily on conveying meaning and understanding rather than on strong grammatical accuracy. While grammar is still developing, their comprehension and interpretation of concepts play a more significant role in their language usage.

The Later Multi-Word word stage is above 30 and beyond children will typically begin to **communicate in more significant sentences that make both grammatical and functional sense**. During this stage, children may not possess a strong grammatical sense, but they effectively communicate their desires, needs, and emotions through functional language. This stage is sometimes referred to as the telegraphic stage because children imitate and mimic the concise style of telegram language. They begin incorporating longer and more complex grammatical utterances, as well as words with richer meaning, into their conversations.

The multi-word stage typically begins after the age of three, around 36 months, and encompasses a majority of children within this age range. During this stage, children develop **the ability to articulate complex words and sentences**, enabling them to effectively communicate their ideas, emotions, and needs using a variety of expressions. In this final stage of language acquisition, children now learn to use functional morphemes to change the meaning of the words they use.

Morphemes are units of sound or syllables that can be found within words. They can exist as single morpheme words, double morpheme words, or even words with three or more morphemes. Children learn these morphemes and understand how their placement at the beginning, middle, or end of a word can alter its meaning. By manipulating these morphemes, they can modify words and create new ones as a result. Examples include the words but, in, the, and that.

Multi-word expressions are linguistic objects formed by two or more words that behave like a **“unit”** by displaying formal and/or functional characteristics. i.e. In linguistic terms, a sentence, which we can also refer to as a unit, can take various forms. This includes

compound sentences, which are formed by combining two separate smaller sentences using a conjunction word. These compound sentences can also be considered as complex sentences. Children at this stage of language development are actively learning and exploring these structural aspects. Their functional abilities are evident as they demonstrate their understanding and usage of these sentence types.

Phrase combinations are significant as they allow children to express their thoughts, convey meaning, discuss objects, and communicate their emotions effectively. This stage of language development marks a significant milestone, as children have acquired a considerable level of linguistic proficiency. They can engage in conversations and attributing meaning to their words by utilizing a diverse range of vocabulary.

Topic 065

Transition: Early-Word Combinations:-

When we refer to transition in the context of language, it signifies the process of language development or change rather than the literal transmission of language itself. Semantic development acquisition of words and their meanings presentation transcript. **Semantic development relates to the growth and maturation of word meanings and the underlying structure of language.** It encompasses the progression and refinement of the words we use and their associated meanings. Therefore, Semantic development involves the acquisition of words and their meanings.

During the process of language acquisition, children learn words by **combining various morphemes and forming word combinations**. This period of language acquisition is crucial for acquiring both words and their associated meanings. Children also develop an understanding of word meanings based on contextual cues as they progress through this language acquisition phase. A child learns the first word at about 12 months. In the beginning, word development in children progresses at a steady and gradual pace.

However, once the child reaches the age of 18 months or older, there is often a notable increase in language acquisition, commonly referred to as a **"language burst."** i.e. During early childhood, children often experience a **"Vocabulary Burst"** or **"Naming Explosion"** phase, characterized by a rapid increase in their ability to name objects and learn new words. In this stage, children demonstrate a quick and significant expansion of their vocabulary, allowing them to name things more proficiently and augment their overall word development at an accelerated pace. Vocabulary Burst Rapid increase in the rate of word learning in very early childhood. Estimated that the average 5-

year-old knows about 6000 words. If a child knows 100 words at 18 months, this means they learn 5900 words over the next 3 1/2 years.

According to the Americans Research, it has been found that children typically acquire approximately 1,500 new words annually. Consequently, by the age of four or five, their vocabulary is estimated to consist of around six thousand words. On average, children acquire approximately five new words each day. He does the fast mapping of it and how they do that.

Naming insight: Everything has a name and there's a name for everything and concepts. Application of word-learning strategies or principles specific to this task that the children focus on it to learn the language. During this period of language development, children possess an innate ability for language acquisition. However, their interaction with the environment plays a crucial role in expanding their vocabulary. Initially, this interaction primarily occurs with parents and siblings. As children reach the age of three and start attending school, their vocabulary growth further expands through interactions with teachers and classmates. These diverse environmental interactions contribute to the continuous increase in their vocabulary.

World Learning Principles: The principle behind language acquisition is that children learn to break down words into morphemes (consisting of one, two, or three morphemes) or syllables. By deconstructing words in this manner, children can explore and understand the meanings associated with these word components. For example, Taxonomic assumption words are labels for categories of things whole-object assumption. Instead of defining things based on their individual parts or attributes, children typically define objects as a whole. They do not rely on single morphemes or syllables to name objects; rather, they identify and label them based on their overall perception of the entire object. During the transitional phase of language development, children begin to label whole objects exclusively and avoid attaching multiple labels to the same object. It is important to discourage labeling that can lead to confusion and hinder the child's learning process. Consistently associating the same meaning with a word helps enhance the child's ability to learn and understand words effectively.

4 Word-learning errors Under generalization Overgeneralization: During the period of accommodation in language development, children begin to broaden their word usage beyond narrow contexts. For instance, if a child initially refers to only their own pet as a "cat," they gradually learn to apply the term to other cats in their environment. This process involves adjusting their existing information, schemas, and mental representations.

When encountering new objects or animals, such as seeing a dog for the first time, children compare and contrast it with familiar objects. For example, if they perceive a dog to resemble a donkey in some aspects, they learn that it is not a dog but a separate entity referred to as a donkey. Through these early word transitions and combinations, children expand their knowledge and understanding of the world. This stage marks a vital phase in a child's language learning journey as they transition into more comprehensive language usage.

Lesson No. 13

PHONOLOGICAL LEARNING PROCESS -1**Topic 066****Multi-word Utterances:-**

The multi-word stage is also known as the telegraphic stage. It includes the production of longer and more complex grammatical utterances. And the sentences in which three or four words are combined. Typically, the stage that follows the two-year milestone is the subsequent stage in language development. **It is called the telegraphic stage due to the sentences that are recited mimicking the information found in telegrams.** This multi-word utterance is the most important stage of language development or language acquisition. Also, take it as the final stage of language development.

In this stage, **children appear to deliver words, in the correct order, making no errors, despite producing shortened sentences.** This means that in the English language, sentences typically follow a subject-verb-object order, and children naturally grasp and use this structure when incorporating words into their speech. They maintain the word order and assign meaning accordingly, demonstrating their understanding of grammar. Clearly, rapid development is seen from the age of two and onwards. During this stage, there is a **rapid acceleration in language development among children.** Between the age of 24 months and 30 months, which spans the period before reaching three years old, the speed of language development in children is notably high. Simple two-word utterances begin to evolve into a broad range of utterances within the course of only a few short months.

The Two-Word Utterance serves as a developmental milestone preceding the Multi-Word Utterance stage in language acquisition. As children progress from the Two-Word Stage to the Multi-Word Stage, they gradually transition to using more than two words in their sentences while maintaining the correct word order. This progression allows them to effectively convey their intended meaning as their language skills mature.

After 18 months, the child's vocabulary expands immensely, with as much as ten to twelve words being recited a day. Between 18 to 24 months, the pace of a child's language development accelerates significantly, accompanied by a substantial increase in their vocabulary. They begin incorporating approximately eight to ten new words into their daily usage, thereby expanding their language skills and enriching their mental lexicon or

vocabulary. Evidently, in this stage, the most important lexemes, such as prepositions, and determiners are parts of speech. The usage of parts of speech in the English language is crucial for constructing complete and meaningful sentences, as well as combining and connecting sentences.

At the stage of multiword utterance, children's language development reaches a level where they can **arrange words in the correct order**. They are able to construct sentences by combining multiple words, allowing them to effectively express complex ideas and convey their intended meaning. **Auxiliary (Supplementary) verbs and varieties are utilized to express ideas**. It means a child can communicate their meaning and convey information by employing auxiliary or supporting verbs, as well as utilizing a variety of different words and verbs. Although the child tends to confuse the context of sentences, hence one must pay close attention to understand their telegraphic speech. Context is also very important in language development, as we read in pragmatics it is the “study of language use in the sentences,” A child pays careful attention to comprehend the appropriate order of words, their developmental stage, and the context in which they are presented.

Children only start to produce words accurately by the age of 4. However, the pronunciation of many words, Also, children have achieved advanced proficiency in pronunciation, and their language development is almost fully developed. It marks the final stage of language acquisition, typically occurring around the age of four. During this period, children acquire correct pronunciation through learning from their environment, caregivers, parents, and teachers at school. They are also capable of effectively connecting words and expressing themselves in the appropriate order.

At this stage is described as individual, and adult correction is not encouraged because the child does not tend to hear their own mispronunciations, therefore not recognizing the mispronunciation that the parent desires to fix. When adults or caregivers attempt to correct a child's pronunciation or language, the child often fails to pay attention due to the discrepancy between their own language abilities and those of the adults. While adults may provide correct pronunciation and word order, children tend to stick to their own pronunciation and word usage. Even if parents or caregivers insist on correction, the child may not immediately respond or make the desired changes. It is important to recognize that this stage of language development requires time and patience, as it represents a crucial phase in the child's linguistic growth.

Topic 067**Phonological Learning:-**

The term phonological is derived from the Greek root phone, which means voice or sound. Phonological learning means the study of sounds. As you know human language starts with sounds then syllables are made from words. Words are formed, words are single words, then multi-word stage, three-word stage, or multi-word stage, they are combined in this way to form sentences. But it is based on sounds, we need to learn the language before or after learning the language, it is important that we learn the types of sounds or the way sounds are used in language.

Phonological learning focuses on the **study of sounds in language**. Human language begins with sounds, which then form syllables and eventually combine to create words. Whether learning a language before or after acquiring it, understanding the different types of sounds and their usage in language is crucial. It is essential to grasp the foundational role of sounds in language acquisition and development.

It is referred to as phonological learning. Phonological learning refers to the science of phonemes. This is the study of speech sounds. And phonemes are the smallest unit of speech. Phonological learning refers to acquiring the system of speech sounds of a language through phonological awareness. During this stage, a child's understanding of sounds and phonemes is fully developed before they enter the word stage. Phonological awareness plays a crucial role in language acquisition, as it greatly influences the child's ability to acquire and comprehend language effectively.

Phonemic awareness, phonological coding, and recovery of phonological codes. The process of assigning meanings to codes and retrieving phonological codes refers to the cognitive processes involved in extracting or retrieving information from long-term memory.

Phonological learning involves becoming aware of the sounds of spoken language. In language learning, the initial objective or task is to develop spoken language skills through listening. Effective listening lays the foundation for accurate speech production.

Phonological awareness is holding information in working memory. When phonemes or information stored in a child's working memory are retrieved, it involves repeating or speaking to them aloud. This retrieval process transfers them from working

memory to long-term memory, where important and valuable information is stored. According to the inferential processing model, phonemes are subsequently stored in long-term memory and can be accessed from working memory for phonological learning during the language acquisition process.

Accessing phonological Information and recovering that information.

Information retrieval or recovery refers to the process of accessing and retrieving information that is already stored in working memory. It involves extracting the information from its phonological codes in order to recognize, categorize, or assign meanings to the retrieved content.

The making of associations between sounds and printed symbols. The printed symbols of language, and making a relationship between the sounds, we would retrieve the phonological codes and communicate with them.

A hierarchy of phonological awareness skills consists of rhyming, alliteration (repeat), blending (combine), segmentation (splitting apart words of sentences, and words of phonemes), and manipulation (change). The retrieval of phonological codes and effective communication are integral components of the hierarchical progression in language development, language learning, or language acquisition. These elements constitute fundamental aspects within this process.

Phonological awareness is a critical early literacy skill that helps kids recognize and work with the sounds of spoken language. Linguistic awareness and critical literacy skills are crucial processes in language development. Literacy skills encompass various abilities such as phonics, word formation, and naming, enabling children to recognize objects and comprehend the sound structure of spoken language. These literacy skills facilitate word comprehension, phonemic awareness, and expressive language production in children. Phonological awareness is made up of a group of skills. Examples include being able to identify words that rhyme. Poetry or poems play a significant role in fostering a child's language acquisition as they engage in rhyming words. Children naturally develop an interest in language through the rhythmic and melodic qualities of rhymes. They learn words by combining phonemes, further enhancing their linguistic skills.

Counting the number of syllables in a name, recognizing sound patterns, segmenting a sentence into words, and identifying the syllables in a word. In language development, recognizing sound patterns and naming objects are key aspects of

word acquisition. Additionally, sentence segmentation involves breaking down sentences into their constituent parts, interpreting them, and understanding the syllables and morphemes within the words. Further, the most refined form of learning any language is formic awareness.

Topic 068

Auditory Maps:-

Syllabic units rather than separate consonant vowel phonemes. Before the auditory maps, I will talk a little about the phonemes and phonetics of language, which are syllabic units, rather than separate consonants and vowels. Syllabic units possess elements of both phonemes and a combination of consonants and vowels. They have also provided of great importance in early child language development.

- **Word learning is an association between a pattern on the auditory map and a pattern on the concept map, between the way a word sounds and its meaning.** The relationship between the sounds of words and their meanings is similar to the connection between syllabic units and phonemes.
- **When a child hears a word and sees an object simultaneously, an association is formed.** Most likely, at this early stage, many elements of the two maps are not interconnected. It means that when a child utters a word that corresponds to the name of an object, it establishes a connection between the word and the object itself.

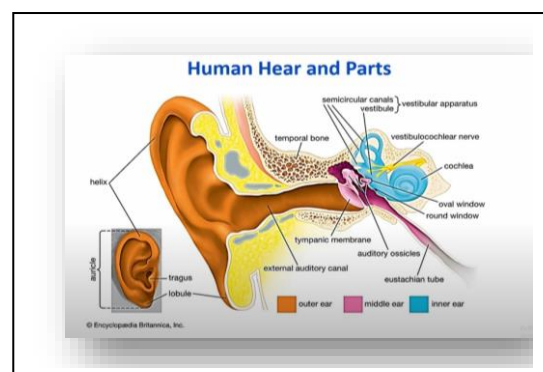

Path of Sound: Sound waves enter the outer ear and pass along the ear canal to the eardrum. Soundwaves bounce off the eardrum, making it vibrate. The eardrum is connected to three small bones, known as ossicles. Vibrations pass through these bones, exerting pressure on the cochlea's upper membrane and ultimately reaching the oval window. This process causes the cochlea to vibrate, generating waves within the fluid it contains. The fluid then moves forward, converting the sound's frequency into waveforms. As the waves travel through the nerves to the brain, they undergo frequency transformation. Subsequently, the brain interprets these frequencies as words, resulting in comprehension and understanding.

Structure of the Ear:

- Outer ear
- The middle ear
- The inner ear

To gain a better understanding of the auditory process, it is essential to examine the various components and their structure within the human ear.

In the diagram provided, we can observe the different parts of the ear. Beginning with the outer ear, the ear canal serves as the entry point for sound waves. Moving into the middle ear, the sound waves reach the eardrum, causing it to vibrate. These vibrations are then transmitted through the three small bones, known as

ossicles. The final bone, called the stapes, transfers the vibrations to the cochlea. Inside the cochlea, the fluid converts the vibrations into sound wave frequencies. The human ear is capable of perceiving frequencies ranging from 20 to 20,000 Hz. From here, the auditory nerve carries the signals to the brain, where the sound is processed and given meaning. This entire listening process is facilitated by auditory maps, which transform the sound waves into comprehensible words.

Topic 069

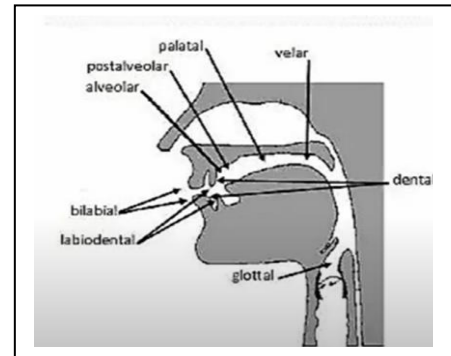

Places of Articulation:-

The location of where the sounds are produced is called “articulation”. If it is called a verb, it means articulate, and if we use it as a noun, then articulation. There are eight places of articulation that produce the sounds. **The sounds can be distinguished as to where in the oral cavity these are articulated.** i.e. where in the mouth there is most obstruction when they are pronounced. When sounds are produced, they result from the contact or collision of two organs within the oral cavity. This interaction generates specific sounds, and the location where these sounds originate is referred to as the place of articulation.

Articulatory maps are representations of how the vocal tract produces speech of sounds. i.e. how the vocal tract produces sounds in it. Show movements, and positions of the tongue, lips, jaw, and other parts of the vocal tract that are involved in speech production or production of language. Sounds are produced when various organs within the oral cavity come into contact with each other. Different sounds are created depending on the specific locations where these organs touch, resulting in a diverse range of distinct sounds. How speech sounds are produced and how they differ across languages. All these aspects will be discussed in detail.

The place or point of articulation (POA) are eight:

- Bilabial
- Labiodental
- Dental
- Alveolar
- Postalveolar
- Palatal
- Velar
- Glottal

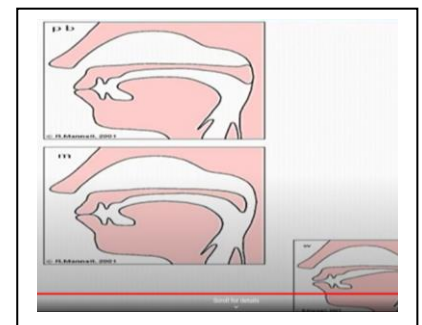

These places are points or places of articulation. Their explanation is described as follows: Dear students, this is a diagram in front of you. These sounds are formed within the oral cavity based on the specific points of contact or touch. The diagram before you illustrate the names of these points of articulation.

- For example, when the two lips come together, the resulting sound is known as a **bilabial sound**. Similarly, when the upper front teeth and the lips collide, it is referred to as a **labiodental sound**.
- Another example is the **alveolar sound**, which is produced when the tongue makes contact with the area behind the upper front teeth.
- Furthermore, the **post-alveolar sound** is created when the tongue touches the area just behind the alveolar ridge, known as the **palatal place**. The resulting sound is called a **palatal sound**.
- Similarly, the **velar sound** is produced when the back of the tongue makes contact with the velum.
- Lastly, the sound originating from the throat, specifically the **glottis**, is referred to as a **glottal sound**.

There are a total of eight places of articulation. In this module, I will explain four of them, and the remaining four will be covered in the next module.

Let's take a look at them in detail.

- **Bilabial sounds:** They are produced when the lips are brought together. The lower and upper lips approach or touch each other. Examples are /p/, which is voiceless, as in pay, or /b/ and /m/ which are voiced in the bay, may. The above diagram to the right shows the state of the vocal tract during a typical (p) or (b). The sounds

produced by the articulation of p, b, and m involve the contact of both lips. These sounds are categorized as bilabial sounds since they are created by the touching of the two lips.

- **Labiodental sounds:** They are made when the lower lips are raised towards the upper front teeth. English (f) and (v) are labiodental fricatives. The diagram to the right shows the state of the vocal tract during a typical (f) or (v).
- **Fricatives:** Fricatives are sounds that are produced when air is passed through a narrow opening with consistent pressure. The fricative sounds, such as "f" and "v," are examples of this. These sounds correspond to the initial sounds we discussed earlier, specifically the bilabial and labiodental sounds.

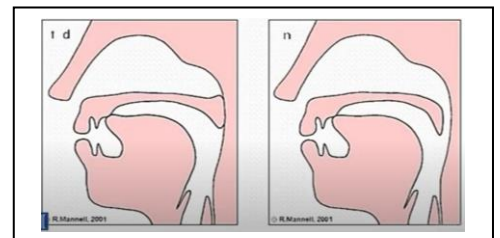

Lesson No. 14

PHONOLOGICAL LEARNING PROCESS - 2

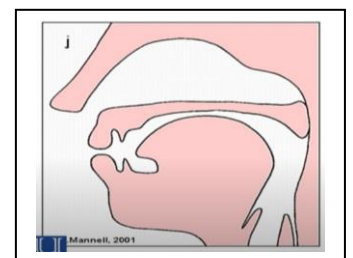

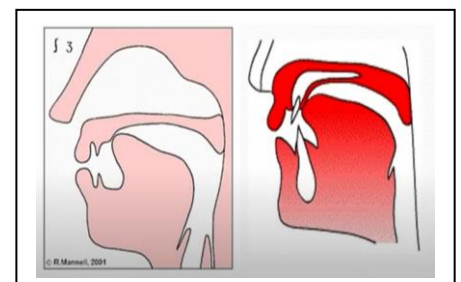

Topic 070Places of articulation:-

In the **alveolar consonant**, the tongue tip touches the alveolar ridge, behind the upper teeth. It means the tip of the tongue touches the back of the front teeth, and the sound is produced. The English stops (t), (d), and (n) are formed by completely blocking the airflow at this place of articulation. The fricatives (s) and (z) are also at this place of articulation, as in the approximant (r) and the lateral approximant (l).

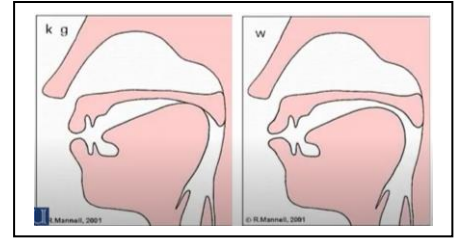

In the diagram, you will also see how these sounds are produced. This diagram is being shown in front of you and is like the t, d, and n sounds. It demonstrates how the tip of the tongue touches the back of the front teeth to create these specific sounds. Take note of the complete stop created by the tongue to produce these fricative sounds.

- In a **postalveolar consonant**, the constriction is made immediately behind the alveolar ridge. It means that the tip of the tongue touches the area just behind the front teeth, specifically at the beginning of the palate. Then, the sound of the postalveolar consonant is produced.
- The contraction can be made with either the tip or the blade of the tongue. The diagram to the right shows the state of the vocal tract during the first half (the stop half) of an affricate (tʃ) or (dʒ). By examining the articulated maps and diagrams of these sounds, we can observe that the postalveolar sound is generated by the immediate contact of the tip of the tongue.
- In a **palatal consonant**, the body of the tongue approaches or touches the hard palate. English (j) sound is produced through the palatal approximant. The tongue body (dorsum) approaches the hard palate, but closely enough to create disorder in the airstream.

- **In a velar consonant**, the body of the tongue approaches or touches the soft palate or velum. English sounds (k), (g), and (ŋ) are stops made at this POA (Position of Articulation). The diagram shows a typical (k) or (g) through where exactly on the velum the tongue body hits will vary a lot depending on the surrounding vowels.
- The (x) sound made at the end of the German name Bach or the Scottish word sound is the **voiceless fricatives** made at the velar POA. As we have seen, one of the two restrictions from a (w) is a **bilabial approximant**. The other is a **velar approximant**: the tongue body touches and approaches our soft palate. The diagram provides a clearer understanding of the sounds of "k," "w," and "g." These sounds are produced when the body of the tongue makes contact with the soft palate.
- **Glottal: The glottis is the opening between the vocal folds.** In (h) this opening is narrow enough to create some disorder in the airstream flowing past the vocal folds. For this reason, (h) is often classified as a glottal fricative. So, observe how the sound produced at the opening of our throat, which is close to our vocal cords, results in the creation of a glottal stop. The glottal stop is a type of consonantal sound used in many spoken languages, produced by obstructing airflow in the vocal tract or, more precisely, the glottis. Look at the diagram illustrating the production of the "H" sound, which originates from the throat and specifically the glottis.

Topic 071

Single word utterances Patterns: -

To utter means “to say” something, you are making utterances. When you make utterances, you are essentially constructing sentences or phrases using one or more words. During the one-word stage of language development, which typically occurs between 12 and 18 months of age, children tend to communicate using single-word utterances like "milk" or "mummy." These utterances consist of one or two words, often used as a single unit, such as in the example "all gone."

Through the process of language acquisition, a single word fulfills this naming function by associating specific objects or concepts. At this stage, children do not possess a grasp of grammar, but they rely on single-word utterances to express their needs and

interests. Their caregivers, typically parents, can comprehend the intended meaning behind these single words with ease.

The holophrastic stage refers to a single-word utterance that effectively conveys its meaning through its specific pattern and structure, despite being a solitary word. Holophrases: Single words or phrases that convey more complex messages “juice”, “I want some juice”, or “I’ve spilt some juice”. Similarly, when a baby utters the word "milk" instead of saying "I want some milk," those who take care of the baby, such as their mother, quickly comprehend that the baby needs milk or juice.

Context, gestures, and intonation enable parents/caregivers to understand what a child means. The significance of context and gestures should be noted when observing children in the holophrastic stage of single-word utterances. In this stage, the child's context and focus play a crucial role, allowing parents to interpret the meaning behind the child's gestures or the emphasis placed on a particular word. **Although the child’s utterances are limited, their understanding of syntax is (predictably) more advanced.** The significance of this observation is that despite our limited ability to predict a child's understanding of grammar, their comprehension may be at an advanced level, allowing them to convey meaning even by single words effectively.

The evidence is that children at the one-word stage can respond to the two-word instruction such as; “Kiss mummy”. Hence, children at this developmental stage progress from single-word patterns to the subsequent two-word stage, where they begin to construct two-word sentences. However, during the single-word phase, caregivers occasionally combine two words to form a sentence that the child can comprehend. **Interestingly, these one-word utterances can also take the place of a whole sentence.** In other words, a single word functions as a replacement for an entire sentence. For example, when a child sees his father, he utters “dada”, starting the phrase. “I see Daddy”. He may also use “juice”, indicating that he would like some juice – “give me more juice”. So, when a child expresses "juice" or any other need using a single-word pattern, they effectively convey their requirements without the requirement for multiple words. While their caregivers fully comprehend their intentions through careful attention to their focus and gestures.

Examples of patterns: Mom, Dad, Papa, Nano, Cat, Dog, Water, and Food. The child's vocabulary consists of words that form patterns within their environment, and they possess a complete understanding of these words even when expressed as single-word

utterances. When the child articulates a phrase, they utilize these single-word patterns to communicate information to their parents within their surroundings effectively.

Topic 072

Phonological Processes:-

The phonological processes observed in children's language development demonstrate diverse patterns. These processes involve the addition, deletion, and alteration of sounds, making it necessary to discuss them extensively within this module. **Phonological processes are patterns of sound replacements** that children use to simplify their speech. The child's brain makes rules to simplify speech sounds/words to speak which are called phonological processes. Several processes affect the phonetic recognition of phonemes, and meanings we state them, and describe them in other words in different contexts. In other words, several general processes result in different allophones of the same phoneme.

Here are some examples of typical phonological processes:

- Cluster Reduction (pot for spot) (here a child has omitted the alphabet "s")
- Reduplication (wawa for water) (here the term wawa is duplicating in this context)
- Weak Syllable Deletion (nana for banana) (here a child has skipped the alphabet "B")

So, there are various patterns observed in the phonological processes of children during their language development. At times, they may tend to add, reduce, or alter letters.

- **Final Consonant Deletion** (ca for cat)
- **Velar Fronting:** (/t/ for /k/ and /d/ for /g/). In this manner, words undergo replacement and continuous change as the meanings of letters transform into phonemes.
- **Stopping:** (replacing long sounds like /s/ with short sounds like /t/)
- **Assimilation:** (changing consonants in a word to be more like other consonants in the word, like gog for dog). Thus, the child replaced the letter "D" with another letter, resulting in the formation of the word "Gog."
- **Assimilation:** A sound becomes more like a neighboring sound in articulatory terms. In this term sound, it becomes similar to its nearest sound.
- **English approximants** are realized as voiceless after a voiceless consonant.

- **Vowel Nasalization:** English vowels are nasalized. They are pronounced through the nasal sounds and when they are immediately directly and indirectly before a nasal consonant.
- **Palatalization:** Sound becomes palatalized when realized before the palatal glide or the vowels.
- **Dissimilation:** A sound becomes less like a neighboring sound in articulatory terms. In the context of articulation, a sound that experiences reduction will change to the point where it no longer sounds the same.
- Some dialects of English break up word-final fricatives.
- Fricative clusters realized as fricative-stop.

Some ages for when common phonological processes should stop but being used:

- **Velar assimilation - 3 years**
- **Nasal assimilation - 3 years**
- **Final Consonant Deletion - 3 years**

Stopping of Fricatives:-

- /f/, /s/ - 3 years
- /z/, /v/ - 4 years
- “sh”, “ch”, “j”, “th” - 5 years

Over several years, this process involves continuous modification and alteration of sounds, phonemes, or even their replacement, resulting in their transformation and fragmentation.

- Weak Syllable Deletion - 4 years
- Deaffrication (sh for ch) - 4 years (At the age of four, the sound "SH" changes and transforms into the sound "CH.")
- Velar Fronting - 4 years

Cluster Reduction:-

- without /s/ - 4 years
- with /s/ - 5 years
- Gliding of Liquids (/l/ and /r/) - 6-7 years

These are the phonological processes that children at different ages use these processes are the phonological process of language learning and the rules that are used by different ages to learn the language.

Topic 073**Language Disorders and Abnormal Phonological Processes:-**

In children with phonological disorders, we sometimes see other phonological processes being used that are abnormal, but they are also getting smaller. For example, Initial Consonant Deletion (og for dog). So, in a dog, the letter "D" is removed. Backing (moving front sounds like /t/ and /d/ to the back of the mouth like /k/ and /g/). Sometimes, when they do it like this, it means they are replacing something. This indicates that there are unusual aspects and abnormalities in their language that we are examining.

- Glottal Replacement (ha er for hammer)
- Fricatives Replacing Stops (sop for the top) In this situation, a child replaces the word "Sop" with "Top". This can be considered as an example of elision, where certain sounds are omitted in speech. It's similar to how children babble as they learn to communicate.
- Stopping of glides (darn for yarn)
- Vowel Error Patterns

How to Treat Phonological Disorders:-

This is typically done in speech therapy sessions with a licensed speech-language pathologist.

Here are the steps for fixing this:

- **Listening:** First, the child must hear the difference between his errors and the correct production or pronunciation. After that, the next step of treatment will start.
- **Speaking Words:** Next, the child must say the words without using the phonological process. A child will pronounce the words without using the use of grammar rules.
- **Speaking Sentences:** Once the child can say the specific words, he must use those words in sentences. By using specific words, he will enhance his language skills and make progress in managing his disorder.
- **Structured Conversation:** Now, the child must practice not using the process during longer speaking situations, such as answering a question or talking about a

past event or a story. Therefore, in all long conversations, some of the phonological process is ignored.

- **Carry-Over:** Only once you have done all of that can you work on helping the child remember to not use the process in everyday speech.

Once you assist the child, they continually remind him to refrain from certain behaviors, ensuring a consistent carryover process. They consistently reinforce the awareness that he should avoid using disordered elements. This approach addresses the language disorder and aims to enhance strategies for improvement.

Lesson No. 15**PRE-SCHOOL PRAGMATIC AND SEMANTIC DEVELOPMENT****Topic 074****Learning Units and Extensions:-****Learning Units:-**

Preston defines a unit as “A unit is as large a block of related subject matter as can be overviewed by the learner. A learning unit is a collection of subject matter or a section that we bring together, create, review, and organize as a cohesive body of knowledge for children's learning.

Sanford's view “Outline of carefully selected subject matter which has been isolated because of its relationship to pupils.” This indicates that the subject matter is not employed in isolation, but rather about its impact on the student. The unit is an organized body of information and experience designed to effect significant outcomes for the learner. The objective of creating a curriculum unit is to meet the necessary criteria for imparting knowledge, competencies, skills, and behavioral development in children, to effect positive change. The resulting outcome, which is influenced by the educational learning process, is the development experienced by the child after engaging with the unit.

Extensions:

Education is the process of training and instruction to develop the knowledge, abilities, and skills of the children. The term "Education" originates from the Greek word "Educator." This word encompasses the concepts of both knowledge and training. Extend the child's "sentences" An educational unit serves as a platform through which a child expands their learning, skills, language, and sentence construction abilities.

For example,

- The child says, "Car go," and you say, "The car is going. It is a red car.
- The child says, "Baby cry," and you say, the baby is crying He is hungry.

The individuals who provide care and engage in conversations with a child play a crucial role in expanding their language skills. These caregivers, such as parents or teachers, assist the child in learning new words and language units and facilitate the extension of their linguistic abilities. The process of language learning and its expansion occurs through interactive experiences and guidance from these caregivers or educators. The learning units

and extensions align and progress together collaboratively. It is the process by which an individual, increases his/her abilities, and changes his behaviors. Learning can be defined as the process of modifying behavior. Whenever a child engages in learning, it results in a noticeable alteration in their behavior. There is learning to use more “grown-up” language which a child hears from the older siblings, parents, and teachers. When parents and teachers aim to teach language, they will simultaneously provide language extensions and learning units, fostering interactive engagements with the child.

Language expansion and language extensions are two ways for you to help children develop their expressive language skills. Both these strategies can be employed to facilitate the development of a child's language skills, leading to the refinement and enhancement of their linguistic abilities. There are various strategies, timings, and settings in which we can engage in language use and communication. The child plays on the playground and says “Big swing”. The adult extends the utterances and says, “Yes, that is a big swing.” It is a green swing. It goes back when I push it. As a result, the child's language expands, and over time, they progressively refine their language skills through continued practice and communication. This way parents extend their language by talking about their various places and times i.e. “Grocery Store”, “Retail Stores”, “Bedtime” and “Riding in the car”. During storytelling or conversations with children, utilizing language extension techniques is crucial. By incorporating extended sentences and learning units into the dialogue, the child's language skills can be further developed and refined. This involves expanding on their existing language abilities and incorporating additional sentences, learning units, and extensions to foster language growth.

Topic 075

Individual Differences Bilingualism:-

Bilingualism refers to learning two languages at the same time.

Individual vs Societal bilingualism:- In our country, the challenge of language acquisition extends beyond bilingualism, as children often learn more than three to four languages. For instance, they use English in schools, Urdu at home, and learn their mother tongue, Urdu. This multilingual context poses significant difficulties for them in navigating and acquiring multiple languages simultaneously.

Bilingualism as an individual trait:- Bilingualism is an individual as well as societal trait, which I will discuss later. So, basically, it is the psychological state of an individual who has access to two language codes to serve communication purposes.

Learning two languages simultaneously entails mastering the particulars of their respective codes, vocabulary, phonetics, and word structures. Communicating effectively in both languages presents a challenging task that involves navigating the complexities of dual language usage. This process is not an easy feat and comes with its own set of difficulties and obstacles. Bilingualism as a societal attribute. Then it also happens that, two languages are used in a community and several individuals can use two languages. In the United States, approximately 20 percent of the population is proficient in two languages, namely English and Spanish. Similarly, in Canada, English and French are both widely used. This bilingualism presents a broader societal challenge. However, when discussing child development and language acquisition, we specifically address the unique realities and circumstances surrounding bilingualism.

5 dimensions:- Let us now explore the five dimensions of bilingualism, examining each one in detail.

1. **Cognitive organization of two languages:-** One aspect of bilingualism involves understanding language proficiency and the sequential acquisition of two languages.
2. **Age of acquisition:-** At what stages and ages do children acquire language proficiency in each language?
3. **Language proficiency:-** This pertains to the proficiency level attained in each language.
4. **Sequence of acquisition of two languages:-** The sequence of language acquisition can occur in two ways: simultaneous acquisition, where a child learns both languages concurrently, or sequential acquisition, where a second language is learned after the completion of the first one.
5. **Societal factors:-** There are social factors within society that significantly influence language development, particularly in the context of bilingualism.

Equal proficiency in two languages is rare. It means attaining equal proficiency in two languages is a rare occurrence. It is also called non-balanced bilingualism. So, an individual who has obtained a higher level of proficiency in one language is more common. It is quite common for individuals to exhibit a high level of proficiency in one language while not demonstrating the same level of proficiency in the second language. Several factors cause the variability across children in second-language acquisition. When it comes to bilingualism and second language acquisition, we observe various factors of variability among children.

Factors reason for the variability:-

- Age at which a child receives input in each language.
- The environment in which the language occurs.
- The community support and social prestige of each language. The type of community support available to a child and the social prestige associated with a language significantly influence language acquisition.

Differences and similarities in the languages:- Individual factors motivation and language-learning aptitude. Two crucial individual factors in language acquisition are the child's motivation and their attitude toward language learning.

Simultaneous acquisition:-

Acquisition of two languages at the same time.

- Development of two languages before the age of 3.
- Initial language mixing, followed by a slow separation and increasing awareness of the differences. Initially, the child may mix sounds or words from both languages, but as they mature, their awareness increases, enabling them to differentiate and separate the words in each language, thus facilitating their understanding of the languages.
- After separating phonological and grammatical systems, the dominant system may still affect vocabulary idioms. Moreover, as children acquire more words, one of the languages tends to become dominant in their vocabulary. They use words from this dominant language more frequently than the other language.

Topic 076**Pre School Pragmatic and Semantic Development:-**

The pragmatic aspect of language focuses on its practical use, including language interactions, users, and communication contexts. On the other hand, semantics relates to the study of the meanings of words. So, children learn a language with a conversational partner. Children acquire language through engaging in conversations, primarily with those in their immediate surroundings, such as parents and younger siblings.

Even though a child learns to take turns, conversations are short, and the number of turns is very limited. Children must take turns during conversations, allowing them to learn the language and contribute to the development of their linguistic skills. Through this

language learning approach, children acquire or generate approximately 20-30% of their speech during the preschool stage.

- **3 years old:-** At the age of three, children engage in monologues, which involve verbalizing their thoughts and talking about themselves. They engage in self-talk during various activities, such as when they are alone, at bedtime, or while playing by themselves.
- **4 years old:-** At the age of four, children begin to exhibit selectivity in their monologues. Their language skills show signs of maturation as they gradually transition towards engaging in dialogues. Additionally, their social interactions with parents and caregivers become more pronounced and frequent. The pre-sleep monologues of many children are rich with songs, sounds, and nonsense words, Gradually, those dialogues become more social.

Dialogue refers to the communication between two individuals. At the age of four, children's language becomes more refined and developed through engaging in dialogues with others. Children are engaged in this language development process for many years. By the age of four, a child can speak a few sentences on a particular topic, but they may struggle to stay focused on that topic for long. However, it is important to note that their language skills have significantly developed by this age. Conversations play a crucial role in their language development, and they can have conversations with their parents, siblings, and teachers at preschool or school. Throughout preschool, audible monologues decline with age, and inaudible self-talk increases. Conversation, introduce, shift, and refer to the topic. **Child Conversational Skills** Young children can introduce a topic but have difficulties maintaining that topic beyond two or three turns. Due to their limited vocabulary (lexicon) and knowledge capacity, children may find it challenging to sustain a topic or engage in complex discussions for an extended time.

By age 3, a child can engage in longer dialogs and learn the language. With the increase of age, a child gains the ability to maintain a topic and they can then stay on it. There is an increase in overall talkativeness at around the age of 3. Around the age of three or four, children start developing the ability to withstand a topic for two or three turns of conversation. They can stay focused on their chosen topic for a few sentences before moving on to another topic. Between ages 3-4, the child is aware of the social aspects of

conversations. So, they also begin to use social words in their speech. In general, utterances are clear and well-formed.

By age 4, a child uses a form of “motherese” when s/he talks with very young children. Motherese language, also known as “Mama language,” refers to the way mothers communicate with their young children, often using simplified and melodic speech. In the preschool years, children's language development encompasses both pragmatics and semantics. Pragmatics refers to the practical use of language within specific contexts, which can change over time. On the other hand, semantics pertains to the meanings of words, typically found in a lexicon or dictionary. Between ages 3-4, a child is aware of the listener's shared assumptions and as a result, uses “indirect responses. At the age of four, children begin to exhibit social behavior in their language usage. They employ phrases such as “please go,” “please,” and “Mother, what are you doing?” While they may initially adopt a somewhat commanding style of speech, as they reach this stage, their language becomes more social, reflecting proper manners and the use of polite words.

Topic 077

Semantic Development Preschool:-

In linguistic terminology, the word semantics is used to designate the science of word meaning. The term, however, has acquired a number of senses in contemporary science/period. In this area of study, other terms are utilized to describe aspects of language development, specifically related to the meanings of words. These terms fall under the umbrella of semantics. Also, a number of other terms have been proposed to cover the same area of study. The preschool stage is the appropriate period for studying and understanding semantic development. That is the study of meaning a clear definition of the meanings of a word is to contribute to removing the “rigidity” of language. When children are emotionally unbalanced, their understanding of semantics or the meanings of words can be affected due to inflexibility. That is, it also improves the lack of emotional unbalance among people that occurs due to language.

First words at about 12 months: Typically, children begin speaking their first words around the age of 12 months. This phase is known as the one-word stage, during which children primarily use nouns. These nouns represent things, objects, and people in their immediate environment. **Initially, this is a slow, gradual process.** The development of language in children is a gradual process. They learn two or three words per week at a slow pace. However, as they grow older, the speed of their language

development increases. **Object words, commands, and some social words (bye-bye):** Children also acquire social words, such as "bye-bye," through their interactions and conversations with caregivers. Alongside naming objects, these social words are learned as children engage in dialogue and receive responses. This interactive process facilitates their language development. Then, several months after it begins, word learning speeds up:

Around 18 months of age, children begin to learn more words, and their vocabulary starts expanding. This vocabulary growth continues until they reach the age of two years. During early childhood, there is a significant and rapid increase in children's vocabulary. The rate of vocabulary growth is notably high during this period. It is estimated that by the age of five, a child's vocabulary will typically consist of approximately six thousand words. **If a child knows 100 words at 18 months, this means they learn 5900 words over the next 3 ½ years.** Within the next three and a half years, children typically acquire around 5,900 words, leading to a vocabulary of approximately 6,000 words by the age of five. The process of word development progresses from single-word utterances to two-word combinations and eventually to more complex sentences. These various stages mark the advancement of language development, with children reaching a point where they can communicate using complex sentence structures. **Naming awareness: everything has a name and there is a name for everything.** Children's language development is influenced by their characteristics and traits.

Application of word learning strategies or principles specific to this task: Children use specific strategies or principles to learn words. These strategies help them acquire new words successfully. One important principle is that children often use words to describe or group things into categories. This categorization method plays a significant role in children's word learning and vocabulary development.

Lesson No. 16

PRE-SCHOOL PRAGMATIC DEVELOPMENT**Topic 078****Preschool Pragmatic Development:-**

Pragmatic development involves studying how language is used in different contexts. The meanings of words are closely tied to the context in which they are used. Children exhibit varying styles of language depending on the situation and the individuals they are communicating with because language is inherently interactive and conversational.

Children learn language with a conversational partner, usually a parent.

Children learn language through interaction with others, especially with their parents or siblings. The way they communicate may vary depending on who they are talking to. When conversing with their parents, children may adopt a different style compared to when they are talking to their siblings. Similarly, when interacting with strangers, children may adjust their communication style accordingly. The style of communication can differ based on the person they are interacting with. Even though a child learns to take turns. Initially, children have a limited number of turns in conversations, and the conversations themselves tend to be brief. As children grow older, around 20 to 30 percent of them become proficient in their language and acquire language skills during the preschool age.

3 years old children use monologues in all types of activities when they are alone. Monologue refers to self-talk, where children use the words, they have learned to express themselves and convey meaning, and up to the age of 4 years old, children become more selective. The pre-sleep monologues of children are rich with songs, sounds, and nonsense words. But gradually, they learn dialogues and become more social by engaging with relatives. Their dialogue expands as part of their language development, and this growth is closely tied to the context in which they communicate. This distinction is necessary because semantics, which is the study of language in context and language in use, plays a significant role in language development.

Register: It is the different styles of speaking. At this stage, children also engage in dialogues and develop their conversational skills. Another aspect worth considering is register, which refers to a distinct style of speaking. By age 4, children use motherese when they talk to younger children. Children often speak with different meanings, and they also acquire their mother tongue, which is the language their mother speaks to them. This language is sometimes referred to as "mama language," as children tend to imitate their

mother's way of speaking. Pitch and loudness level are the first variations used by children to give different roles. There are also some gender variations. The development of language variation involves girls continually enhancing their registers and adapting them to different contexts. They demonstrate a higher proficiency in utilizing these registers, which is a notable characteristic of their language development.

Girls tend to speak more, assume more roles, and modify their register more to fit the roles. At the age of three, children often give commands to their peers. However, by the age of four, their communication style had transformed. Instead of using direct commands, they adopt a more civilized approach and politely communicate their needs or requests. For example, they may say, "Can I have the phone?" or express themselves in a manner that aligns with the rules and expectations set by adults. With time, politeness is one aspect of the register. Preschoolers have more commands with other preschoolers and more permission requests (Can I, Please) with older children and adults.

At this stage, children's communication style shifts towards a politer and requesting approach. The role of parental guidance and training is crucial in shaping this behavior, as children learn to seek permission and engage in respectful conversations even before using certain objects or engaging with others. By the age of three, they begin transitioning from a non-conventional style to a more socially acceptable and civilized manner of speaking. They learn to communicate in a more sophisticated and polite way, using requests rather than orders. Whether they need something or have to interact with someone, they do so in a courteous manner. This aspect of language development falls under the domain of pragmatics, where language use is influenced by contextual meanings. Children learn to speak in a manner that aligns with the specific context they find themselves in. These observations reflect the preschool stage of pragmatic development in children.

Topic 079

The Conversational Context:-

Conversations are the ideal form of communication orally. Language is a perfect way of communication that involves a communicator connecting the sender and the receiver. The people with different views on a topic learn from each other. When people discuss a topic, they naturally learn from one another by sharing their viewpoints and gaining insights from each other. A successful conversation includes mutually interesting

connections between the speakers. Engaging in a conversation about a particular topic allows individuals to expand their knowledge and share information. This process follows a systematic and structured approach.

Conversation is systematically structured, with evidence of the orientation of conversational turns. In a conversation, one person speaks while the other person listens, and then they take turns exchanging ideas and perspectives. This interaction creates a conversational context where individuals discuss a topic together, mutually benefiting from each other's knowledge and insights. Through this process, both participants have an opportunity to learn and broaden their understanding of the subject. It consists of two or more participants taking turns and only one participant speaking at a time. While a speech is an oral presentation by one person directed at a group.

In a speech or discourse, a speaker addresses a group of listeners who are distinct from the speaker. Unlike in a conversation, where participants engage in a back-and-forth exchange, in a speech, the speaker delivers a monologue while the listeners primarily take on a passive role of listening and receiving the information. For a successful conversation, the partners must achieve a workable balance of contributions. To determine the appropriate level of speech and understand the modalities and way individuals communicate, it is essential to consider their initial factors. The orientation of the conversation plays a crucial role in establishing these aspects. A conversation includes mutually interested connections between the speakers or things that the speakers know.

Discourse Structure of Conversation:- A sermon is a type of speech, and its discourse structure follows a predictable convention. It is easier to anticipate the structure of a sermon compared to other fields. On the other hand, conversations have a less predictable discourse structure compared to genres like speeches. Predicting the flow of conversation is generally more challenging. For example, conversations tend to be more open-ended and involve more shifts in topics. **Conversations are generally divided into three main stages by Burns and Joyce (2000:85)**

1. Opening Stage
2. Middle Stage
3. Closing Stage

In a conversation, there are three stages: the opening stage, the middle stage, and the closing stage. The **opening stage** marks the beginning of the conversation, where participants introduce the topic and set the tone for the discussion. The **middle stage** is where both individuals actively engage in the conversation, sharing their perspectives, reaching agreements, or engaging in arguments. This stage encompasses the main body of the conversation. Lastly, the **closing stage** is the final part of the conversation. Here, participants summarize their arguments, finalize their points, and provide concluding remarks before bringing the conversation to a close.

Topic 080

Narrative:-

Purpose:- The purpose of a narrative text is to tell a story. Provide details in the sequence of the events that occur. Further, when narrating a story, it involves describing time, places, and events in a specific sequence.

There has to be a complication to increase the interest of the reader. In storytelling, a narrative often includes a complication that builds up to a climax, which is a crucial turning point in the story. However, creating an engaging narrative can be challenging. The complication adds complexity to the story, and every story should have a clear resolution or ending. This is a fundamental aspect of any story, as it determines how well the reader understands the events and actions told within the narrative. The story must have a definite ending. A good narrative involves readers in the story. This aspect of the story holds great significance. In a story, events should be organized in a specific order and include details about observations, people, events, and places. If there are changes in the locations, it is important to describe them. Characters should experience conflicts, which can involve their roles in the story or conflicts between good and evil. These conflicts create tension and add depth to the narrative. Additionally, establishing connections between past and present individuals and places within the story is crucial, as it contributes significantly to the overall plot.

The text should have a well-structured introduction and orientation that informs us about the who, where, and when of the story. It is essential to establish the relationship between these elements and describe the setting, which refers to the backdrop of the story. The sequence of events leads to a complication, where the character faces a problem or challenge. In the story, conflicts may arise among the characters. As the story

progresses, these conflicts intensify, leading to a climactic moment. Following the climax, the forces of good typically emerge victorious, resolving the problems or challenges that occur throughout the narrative. This resolution marks the conclusion of the story, where all the conflicts and issues are ultimately resolved. So, a resolution (conclusion) where the crisis caused by the complication is solved.

In short stories, this is often at the very end of the story. A short story, also known as fiction, is a condensed form of storytelling that can be read and completed within a short time, typically in a single sitting lasting a few hours or less. It offers a compact narrative experience compared to longer novels. When beginning a short story, it is often helpful to first consider its ending before developing the plot. The plot refers to the sequence of events that unfold within the story. Tips and guidelines for writing a story are also part of the same framework that guides the process of storytelling. It is crucial to prioritize the determination of the sequence of events when crafting a story. Additionally, utilizing time-related words such as "at first," "before," "until," "while," "during," "then," "after," "finally," and others can greatly enhance the narrative structure.

Use various adjectives and adverbs (desperately, surprisingly, to describe the feelings and actions of its characters. The essence of a story lies in its ability to create a lasting impression and generate interest, thus enchanting the reader's attention and fostering a connection with the characters. To enhance the coherence and flow of your story, it is important to utilize linking words or phrases that connect ideas. By establishing a clear sequence of events, the story can unfold smoothly and seamlessly. Incorporate direct speech in your storytelling and minimize the use of indirect speech. Using different verbs will make your story more interesting to read. Be mindful of the tenses you select for your story, and ensure they align with the characters and their situations. Descriptions of people, places, objects, or events and descriptive techniques can be used in a narrative when you want to emphasize specific parts of your narration. So, this is all about the Narratives and their details.

Topic 081

Theory of Mind:-

Theory refers to a set of ideas or principles that explain something. In the context of the theory of mind, it involves understanding how people think and perceive things. When children develop their theories, they observe, question, and gather evidence to

support their ideas. Evidence is important because it helps them understand the theory of mind better.

Theory of mind: Theory of mind refers to the everyday ability to attribute independent mental states to self and others to predict or explain behavior. The theory of mind involves considering the mental states of both oneself and others. It encompasses thinking independently and reflecting on the thoughts and perspectives of others through observation and contemplation. It enables individuals to make sense of and explain the behaviours and experiences of others. These thoughts are normal for social interaction. The theory of mind occurs through social interactions between people and takes a long time to develop. For example: we make sense of people's behavior via belief-desire psychology. By examining people's desires and psychology, we can make inferences about their behavior. Behavior serves as an indicator of the mind, according to the theory of mind. As individuals act based on their thoughts, their actions reflect their thinking process. We can clarify this with an example. Why Jon will carry an umbrella with him because if it rains, he will keep himself dry in the rain. The process of thinking is an ongoing and infinite process within the human mind.

Cognitive Processes of TOM (Theory of Mind):- The Theory of Mind and Cognition pertains to the internal aspects of the human mind. It is often referred to as metacognition, which involves understanding how we learn and process information in our minds. Metacognition focuses on the awareness of our thinking processes. When it comes to theory development, there are various approaches we can take, such as imitation and general theory building. Inductive and deductive reasoning play a role in this process. Additionally, simulation is another method we can employ. Simulation involves imitating or replicating a process or scenario in an artificial environment. By using simulation, we can obtain desired results and gather valuable information before conducting actual experiments. This approach proves useful for theory development, especially when it may be challenging to gather necessary insights in real-life situations.

Inborn mechanism supported by a comparative lack of normal individual difference or cross-cultural variation, and an acquisition of TOM early in childhood. Children, in particular, encounter challenges in theory development. Conversations play a crucial role in assisting them, as they require guidance to ensure uninterrupted thinking and the continuous flow of their thoughts. By nurturing an environment that fosters deep thinking and allows them to reach their conclusions, children can effectively develop their theories.

Experts also mentioned that the mental process is inborn, it needs activating input, like social interactions. We can say that asking questions is essential for learning because it shows what a person is thinking. According to this theory, children gather evidence from their surroundings by observing and interpreting gestures and expressions in their everyday lives.

Lesson No. 17

PRAGMATIC AND SEMANTIC INFLUENCE ON SYNTACTIC DEVELOPMENT**Topic 082****Relational Terms:-**

Relational nouns or relator nouns are employed in numerous languages, including English, as well as other languages. Let's explore and analyze how these nouns are employed in various languages, including English. Relational nouns or relator nouns serve a syntactic function similar to that of appositions in other languages, such as prepositions and postpositions. They can appear before or after other words to convey specific meanings. These usages are crucial for constructing complete sentences, and meaningful phrases, and conveying the intended message. Therefore, studying these relational terms is highly important.

Relational terms describe the relationship between two objects or people, such as “big”, “small”, “in”, “out”, “on”, and “under”. They play a significant role in indicating different positions within a sentence. Additionally, these terms are instrumental in describing both location and time. Their usage provides essential information about the spatial or temporal aspects of the sentence. Acquisition order is influenced by syntactic complexity (complexity of the grammar, meaning), environment, and basic cognitive concepts.

Interrogatives: Children's responses to different types of questions and their production of these types have a similar order of development. Early questions forms include what, where, who, whose, and which, and finally by when, how, and why. These usages involve employing relational nouns or relator nouns in sentences, particularly in interrogative sentences. These words are crucial for children during language development, as they learn how to appropriately use them when asking questions. It is essential to teach children which word to use when inquiring about something or seeking information from others.

Sequential relations, such as "when," "before," "since," and "while" can convey information about the order, duration, and simultaneity of events. These words about sequential relations are spoken and used to express temporal relationships between different occurrences. The order of acquisition of words is closely linked to their usage and the individual concepts they represent. This applies to spoken words as well. Typically,

words like "after" and "before" come before words denoting duration, such as "since" and "until." Consequently, we employ expressions like "since" and "for" to explain the duration and temporal aspects of something. This aspect of language development is highly significant in the process of acquiring language skills.

Physical relations: It involves describing the physical attributes, characteristics, and relationships of human beings, such as thickness/thinness, fat/skinny, more/less, and same/different. These terms, similar to the word "opposite," allow us to explain and express differences or contrasting qualities in various contexts.

Locational prepositions: Spatial relations, specifically in terms of distance relationships, encompass concepts such as "in," "on," and "to." These words are used to describe the spatial connections between objects or entities

Kinship terms: This category relates to human relationships, specifically the words used to describe relational connections between individuals, such as "dad," "sister," and "brother." The majority of significant kinship terms are typically understood by the age of 10, allowing individuals to grasp and comprehend familial relationships. Relational terms are essential components of language that are utilized in various contexts and stages of communication. Without these terms, sentences and languages would lack the ability to convey precise meanings and nuances. Their presence is crucial for establishing accurate and meaningful communication.

Topic 083

Semantic Influence on Syntactic Development:-

The emerging semantic comprehension of language in children significantly influences their early syntactic structures. It is crucial to acknowledge that without acquiring a solid foundation in word spelling, children may encounter challenges in grasping complex grammatical principles. This is because words within grammar serve as the building blocks for learning and internalizing the rules that govern sentence structure. Therefore, for effective learning to take place, children need to possess a strong understanding of word meanings.

Early syntactic structures are often based on the meaning of the words they are using. Young children may use two-word phrases like "mommy up" or "doggie ball" to express a semantic relationship between two objects or actions. As semantic understanding of language expands, children's language grows. The development of children's language is closely linked with their understanding of word meanings. As children acquire

knowledge about the meanings of words, their language skills also progress and advance. As children's language development progresses, they become capable of incorporating more intricate syntactic structures, such as noun and verb phrases. Within the construction of language, the nine parts of speech hold significant importance, with Nouns and Verbs being particularly crucial. These components play vital roles in language development, and their interrelation holds deep significance within the process.

Semantics and syntax are closely knotted in children's language development. The acquisition of word meanings and the understanding of grammar rules are closely interconnected in children's language learning. These two aspects are complexly connected and mutually influence each other in the process of language development. Understanding the meaning of words is like a building block for children to learn and use more advanced language structures. When children have a good understanding of word meanings, they can learn and use the rules for forming more complex sentences and phrases in their language. The children express more refined semantic relationships between words and concepts. They find it easier to use complex rules, and over time more refined children can use the relationship of the meaning of words with good words that accompany refined phrases. Semantic cues and the use of grammatical morphemes are important such as verb tense and agreement.

The usage of various verb forms in different tenses demonstrates a reflective relationship between them. For instance, children tend to use "-ed" endings for past tense verbs more correctly in situations where the connection between a past action and the present moment is easy to understand. During this stage, children have also a clear understanding of how past events relate to the current moment.

Topic 084

Pragmatic Influence on Syntactic Development:-

Before discussing pragmatics, it is essential to address the topic of syntax. We will first establish a foundation in syntax before exploring its relationship with pragmatics.

Syntactic:-

Syntax is the study of sentence structure and the rules of grammar. It consists of rules of grammar that enable us to analyze and understand sentence structures. By applying these rules, we can effectively examine sentences, discuss them, and gain a deeper understanding of their meaning. Language users have the freedom to manipulate language

as they desire. By acquiring knowledge of grammar and syntax rules, individuals can utilize these rules to enhance their language skills. They can construct sentences and engage in various linguistic activities with the help of these grammar rules. Syntax helps common users of a language understand how to organize words so that they make the most sense. Syntax guides us on how to arrange words in a specific order to ensure that sentences effectively convey their intended meaning. It assists in maximizing the clarity and coherence of sentences.

Now we can understand an example from a phrase: **"The through pasture the chased a dog rabbit"**. When sentences are not structured in the expected order (subject, verb, object), they may lack coherence and fail to convey a clear meaning. The arrangement of words according to the sentence structure plays a crucial role in ensuring meaningful communication. Using normal rules of syntax, our first example sentence means nothing. But rearrange those exact words in a new order and they make perfect syntactical sense **"The dog chased a rabbit through the Pasture/ grassland"**. The sentence effectively communicates a complete meaning and thought to the reader.

Pragmatics:-

Pragmatics investigates how language is used in different contexts and situations. It has noticeable effects on the rules and structures of grammar and syntax. Now let's study the explore how pragmatics influences grammar and syntax. Pragmatics takes semantics one step further because it's the study of the meaning of sentences within a certain context. The meanings of individual words come together to form sentences. Furthermore, the context in which the language is used is equally significant. It involves considering factors such as time, location, language, and style to understand the development of sentences, syntax, and the role of pragmatics.

Exploring various contexts is crucial for comprehending the interplay between sentence construction, syntax, and the influence of pragmatics. If we go back over to the example of a rabbit chasing a dog, we can look at the uniqueness of that statement, and when we learn more about the dog's long history of being frightened a cat Pragmatics also consider the declarative sentence. For example, "Break it down" The meaning of this sentence changes dramatically with the context. For example, If you're at the end of a large gathering and someone tells you to "break it down," The main point being conveyed is that pragmatics, by linking language with context, enables us to study how language is used appropriately within specific contexts. In this study, we examine the relationship between pragmatics, syntax (grammar), and the effects that arise from this interaction. It

involves understanding the correct usage of sentences within specific contexts, as guided by syntax, to effectively communicate and align with the intended context.

Topic 085

Semantics:-

Semantics is the study of the meanings of words, phrases, and sentences. In semantic analysis, there is always an attempt to focus on what the words conventionally mean, rather than on what a speaker might want the words on a particular occasion. It means specifically focusing on its meaning in different contexts rather than its general concept.

Conceptual meanings: Conceptual meaning covers those basics. Conceptual meaning refers to the fundamental aspects of meaning that are conveyed through the literal use of a word. **For Example** Some of the basic components of a word like a needle in English might include “thin sharp steel instrument. Its color is black, and it is utilized for sewing or similar activities.

Associative meanings

- In associative meaning you may have ‘associations’ or ‘suggestions’ attached to a word. When you mention the word "needle," it brings to mind the concept of something sharp or associated with pain. In this case, we are not discussing the associative meanings of the word but rather focusing on its conceptual meaning. The associative meaning contributes to the overall concept of a needle.

Conceptual vs Associative meaning:-

Linguistic scholars and experts primarily focus on studying the literal and conceptual meaning of words rather than their associative meaning. When discussing the needle, for example, they primarily examine its conceptual meaning as an instrument rather than its associative meaning related to pain or similar associations. They are normally interested in characterizing the conceptual meaning and less concerned with the associative meaning of words. However, poets and advertisers are very interested in using terms in such a way that their associative meanings are evoked, as compared to the conceptual meaning. Also, experts and scholars focus on creating an impression and sparking imagination by emphasizing the conceptual meaning of words. For example: In the ad of Pepsi “Generation Next” or in the Zong advertisement “sub keh do”. Similarly, in poetry and discussions involving similes, a similar approach is taken. Poets aim to induce an

allegorical or imaginative state in their audience. Therefore, while linguists primarily focus on conceptual meaning, poets and advertisers tend to emphasize associative meaning based on their specific requirements and intentions.

Lesson No. 18**LANGUAGE DEVELOPMENT STAGES - 4****Topic 086****Pragmatics:-**

Pragmatics is the study of language in use. Pragmatics is the study of the meaning in context and it deals with understood meaning as opposed to the mere lexical meaning expressed. It means that the understanding of meanings by the listener or learner depends on the context in which the language is used. It is not solely based on the lexical, grammatical, or literal meanings found in dictionaries, but rather on the interpretation of words as perceived by the listener. How are utterances used? It is about interpreting what speakers mean. In other words, pragmatics is how people make sense of each other linguistically. It refers to how individuals convey their words to others and interpret the meanings behind them when they speak.

Utterance: The use of a sentence, in a particular context. Utterances are actual, physical events and their Interpretation is based on knowledge of the meaning of the word and knowledge about the context. It means that we examine not just the basic meaning of words, but also how their meaning is influenced by pragmatics. We also analyze the context in which language is used. Without considering context, the study would not fall within the scope of pragmatics.

Studies on the pragmatic competence of L2 learners have revealed that grammatical enhancement does not guarantee a desirable level of pragmatic enhancement. It means that improving grammar and pragmatics does not necessarily ensure an improvement in understanding context. They argue that even advanced-level learners are incapable of understanding or conveying the desired intentions and politeness values. In certain situations, individuals may find it challenging to effectively express their intentions and convey politeness values through language. Language serves as a significant means of expression, and when someone is speaking in a specific event or context, they must carefully analyze and consider pragmatics, which goes beyond literal meaning. Poets, writers, and similar individuals aim to utilize pragmatics in their speech to evoke imagination and create a lasting impression.

Topic 087**Preschool Development of Language Form:-**

The preschool period is a time of immense growth in language. An important stage is when children have learned around 22 to 30 percent of the language they acquire during their preschool years. Vocabulary is expanding, and the semantic and syntactic structure of their language is becoming more complex. Children's understanding of word meanings and their ability to use grammar also show significant growth, becoming more complex with each passing day. Their language change represents the development of cognitive abilities. i.e. mental development. Children are becoming more complex thinkers, as their language grows. And they are also curious about language.

3 years old:-_At this stage child can:

- Follow two-part requests, such as put your pajamas in the basket and your slippers in the secret.
- Understand the concept of the two.
- Learn new words quickly; know most common object names. This indicates that their language development progresses at a rapid pace.
- Understand gender differences. Know their own full name.
- Begin correctly using plurals, pronouns, and prepositions more consistently.
- Frequently ask "why" and "what. Children also develop an understanding of interrogative words and learn to ask questions using these words.
- Often use complete sentences of 3 to 4 words

4 years old:- At this stage child is able to:

- Know the names of colors, they can comprehend the names of colors.
- Understand the difference between things that are the same and different. They have developed an understanding of similarities and differences. These are early stages of development, and they express these concepts by using sentences or speaking words.
- Children also learn to recognize and understand differences, such as the distinction between children and adults, or between boys and girls. They express these differences through their language development, which we will discuss in detail

later. This demonstrates that children can communicate and express themselves effectively.

- The children can follow three-step instructions, such as Go to the sink, wash your hands and dry them with the towel. During the preschool language development stage, children comprehend and respond to three-word instructions, acting accordingly based on their understanding. This progress in their language skills reflects how far their language has developed at this point.
- Use the past tense of the word.
- Use sentences of 5 to 6 words. Also, children are capable of forming sentences by combining three to four words and expressing themselves both in understanding and speaking.
- Can describe something that has happened to them or tell a short story. A child possesses the ability to express themselves in an imaginative manner. For example, a five-year-old child typically acquires a vocabulary of around five to six thousand words. By the age of three and a half, they may have a vocabulary of about 150 words, but this number grows significantly in the following years. During this period, in their later years, the speed of language development accelerates, with the child learning approximately 1500 new words each year. Therefore, a child can usually speak clearly enough for strangers to understand them most of the time.

5 years old:- At this stage child is able to:

- Understand relationships between objects, such as; The girl who is playing ball, The boy who is jumping rope. Through this process, children develop an understanding of the relationship between objects, such as which noun is performing an action and the meaning of the verb they are using. They gradually comprehend how these elements fit together and make sense in their language comprehension.
- Usually, can carry on a conversation with another person. They can effectively communicate with others, expressing their thoughts, conveying messages, and providing information about their parents or their home.
- Often call people (or objects) by their relationship to others, such as "Bobby's mom" instead of "Mrs. Smith. “

- Can define words such as "spoon" and "cat". This indicates that they have the ability to describe and define various things and objects.

Topic 088

Semantic Syntax Connection:-

Let's start by understanding the meaning of semantics. Semantics refers to the study of word meanings in a language. It helps us understand how words are formed and how morphemes combine to create words. A single word can contain multiple morphemes. On the other hand, syntax deals with the rules that govern how sentences are structured. It focuses on sentence formation, patterns, and grammatical forms. In summary, semantics focuses on word meanings, while syntax focuses on constructing sentences and their structure within a language program. Both together syntax and semantics define a language. Basically, they design a language, and all details.

These fundamentals play a crucial role in shaping a language. They form the building blocks, much like bricks in a foundation, that lay the basis for constructing a language. In a similar way, semantics deals with the formation of morphemes and words, which then come together to create complete sentences. There exists a profound interdependence between semantics and syntax, where they complement each other in the overall structure and functioning of a language. It is very important for those who implement a language (e.g. those who write the language, those who use the language as a software developer, and those who make tools for developers such as JDT in Eclipse)

A given language can have more than one grammar which describes it. Grammar in any language has a broad scope. At a basic level, it comes after the semantic level. Single words can be used as sentences and convey meaning, especially when they represent objects as nouns or are used as verbs in imperative sentences. The grammar presented to users is not necessarily the grammar used in the implementation. The acquisition of grammar occurs gradually, step by step. After gaining knowledge of semantics, children start developing certain aspects of syntax, such as forming word sentences, around the ages of two, three, or four.

Semantics and syntax are interdependent and mutually beneficial. Semantics helps us understand the meanings of words, while syntax guides us in combining different words to form meaningful phrases and sentences. In English, for example, we typically follow a subject-verb-object order to create coherent phrases. For example, "Ali plays cricket" is a meaningful sentence where "Ali" is the subject, "plays" is the verb, and "cricket" is the

object. However, if we change the order, like "play Ali cricket" or "cricket Ali play," the sense is disrupted. Syntax, along with semantics, ensures that words are connected in a way that conveys the intended meaning. Without this combination, it would be challenging to comprehend any language effectively.

Words and syntax in a language undergo changes over time due to various factors like cultural influences, technological advancements, and the passage of time. When words change, the syntax also adapts accordingly. Just as the meaning of words can change, the way they are arranged in sentences can also change. Semantics and syntax work together to form the complete structure of a language. Understanding a language requires both components because words alone cannot convey meaning and syntax alone cannot create meaningful communication. It is important to grasp semantics first and then understand how words are combined within sentence structures. Only by considering both aspects can a language be truly understood. Semantics and syntax are closely related and complement each other in this process.

Topic 089

Syntax Development:-

Syntax Development refers to the progress made in acquiring grammar rules. As students learn these rules, they become capable of constructing accurate sentences by combining various words and phrases in a language. In Linguistics, syntax is the term for the study of rules governing the combination of words to form sentences.

Syntactic Knowledge:- In English, the basic order for a simple sentence is Noun – verb – object. It is important to combine sentences in a way that follows the subject-verb-object principle to convey the correct meaning. For example, if we say "The kicked boy ball," the sentence is not arranged in the proper subject-verb-object order, and as a result, it does not make sense. To convey the intended meaning, sentences should be structured according to the appropriate principles.

The role in syntactic development is to enable us to combine morphemes into sentences:

- More crackers are increasingly complex as the child develops
- From two morphemes to combining words with suffixes or inflections (-s or -ing, as in papers and eating) to questions, statements, commands, etc. Syntax

development helps us understand how sentences are formed and how they function in conveying meaning.

Syntactic Knowledge:- The knowledge of how words can be combined in meaningful sentences, phrases, or utterances. It means when a child learns he/she knows about the mean length of utterance. As a child develops, their language skills also progress. They begin using more complex sentence structures such as declarative, negative, and interrogative sentences. They also learn to change voices, like using active voice and passive voice, and utilize nouns and pronouns effectively. All of these linguistic advancements are a result of learning grammar rules and developing syntax.

- Mean Length of utterance Language development follows a sequential order
- As age increases so does the length of a child's utterance
- 20-30 months of age utterances are typically two words long
- 28-42 months they are up to four words long, and so on the typical length of a child's utterances what would be expected for their age.

Lesson No. 19**PATTERNS IN PRESCHOOL LANGUAGE DEVELOPMENT****Topic 090****Morphological Development:-**

Morphology is the study of forms. It is the branch of linguistics (and one of the major components of grammar) that studies word structures, especially in terms of morphemes. Words are formed using morphemes. A morpheme can be a single word, like "man," or it can consist of multiple morphemes, such as "shape" or "beautiful." Morphemes are the smallest units that contribute to word formation. When creating words, we examine how morphemes come together to shape the structure of words. In English grammar, words take on different forms depending on their parts of speech. There are nine parts of speech to consider. The study of word creation and formation is known as morphology, and the developmental process associated with it is referred to as morphological development.

Morphology is the study and description of word formation (as suffixes/inflection, derivation, and compounding) in language. A morpheme is a minimal unit of meaning or grammatical function. In language, there are various components called suffixes, which are known as "Sabqay" and "Lahqay" in Urdu. These elements are added to words, either enhancing their meanings or providing additional information, thereby playing a grammatical role. They serve to complete the meaning of a word and contribute to its overall function within a sentence.

It is a meaningful linguistic unit consisting of a word, such as man. Words can consist of a single morpheme or multiple morphemes. For instance, we provided examples of both types. When it comes to verb tenses, let's take the word "open" as an example. If we want to express it in the past tense, we add "ed" to form "opened." Additionally, by adding the prefix "re-" before "opened," we indicate that the action happened in the past again. In this way, the combination of morphemes conveys the desired tense and meaning.

Morphemes are the smallest meaningful units of language, and they play a crucial role in grammar. Let's consider the word "tourist" as an example. It consists of three morphemes. When we add the morpheme "s" to "tourist," it transforms into its plural form, "tourists." These morphemes contribute to the meaning and grammatical function of the word. In this case, "tourist" refers to an individual who visits various places, and by

adding the plural morpheme, the word indicates multiple individuals engaging in such activities, thus completing and expanding its meaning.

In morphology, we examine different types of morphemes, including free morphemes and bound morphemes. Free morphemes are independent units that carry their own meanings in words, like "serve" and "press." On the other hand, bound morphemes do not have standalone meanings and require combination with other morphemes, as seen in words like "comfortable" and "recoverable." Bound morphemes only convey meaning when attached to other morphemes. The study of morphology focuses on understanding the structure of words, analyzing them, and exploring the role of morphemes. This field of study is known as morphology or morphological development.

Topic 091

Patterns in Preschool Language Development:-

After birth, the language development process begins. As the child grows up, their language skills evolve. They start by learning individual words, and then gradually develop the ability to form different patterns of sentences. In the first year, from 3 to 12 months old, a baby only makes sounds. They don't say any real words yet. The sounds they make are things like cooing, smiling, laughing, and babbling (like "da da da"). Babies also communicate by using gestures like waving and pointing. They focus more on using their facial expressions than speaking words. It may sound like they are talking, but they are not using real recognizable words. Even though they cannot properly speak words yet, babies can already understand the language around them.

Between the ages of 12-18 months, a child starts saying their first actual words, such as "mama" to call for their mother. At this stage, they can understand more words than they can speak themselves. They may understand simple instructions like "sit down", even if they can't yet pronounce the words properly. Around this time, the child is also starting to develop other physical skills, like being able to sit up and stand up on their own, as they begin walking. In their speech, they tend to use mostly nouns, like "car" or "duck". By the age of 1.5 years old, a child's vocabulary has grown to contain between 50 to 150 words that they have developed and can recall.

At the age of 18 months to 2 years, telegraphic stage starts. And in this stage, they combine the words 'me go', and 'dada throw ball'. A child uses simple pronouns ('me', 'I', and 'you') but often confusing 'me' and 'I'. In the single-word stage, they use naming

objects that they see regularly. And also responding, replying to simple commands like 'pick up your coat'

As a child reaches 2-3 years old, their language skills continue developing. They start saying longer sentences, often 3 or 4 words at a time, allowing them to communicate more complete thoughts and ideas. At this stage, children also begin using some plural and past tense forms correctly. They start narrating their actions, talking about what they are doing as they do it. They can explain whether an event is happening or not, or describe other occurrences. Additionally, a 2-3-year-old's conversational abilities improve. They respond more frequently when spoken to, demonstrating better back-and-forth communication skills.

By the ages of 3-4 years old, a child's speech becomes much clearer and more articulate. They are now able to understand and communicate with people outside of their family, even strangers. Some children at this stage may even be able to use a mobile phone to communicate. Children in this 3-4-year-old age range also start asking more advanced question words, such as "who", "what", and "why". Their overall language patterns and development become more mature and sophisticated.

Topic 92

Bound Morphemes:-

Free morphemes and bound morphemes are fundamental building blocks of language that work together. Free morphemes are words that can stand alone and have a single, complete meaning on their own, such as "boy", "car", "desire", "gentle", and "man". These are independent units that produce their self-contained meanings.

Bound morphemes are morphemes that cannot stand alone on their own - they must be attached to free morphemes (full words) to have meaning.

In the Urdu language, examples of bound morphemes would be words like "Sabqay" and "Lahqay" - these cannot exist independently but must be attached to root words. Similarly, in English, prefixes and suffixes are types of bound morphemes. For example, the word "cat" is a free morpheme, with a complete meaning on its own. But when the bound morpheme "-s" is added, creating "cats", it becomes a new word with a slightly different meaning. Free morphemes are words that can stand alone and have independent meanings, like "cat", "happy", "sleep", etc. Bound morphemes are morphemes that cannot stand alone and require attachment to free morphemes.

These include affixes like prefixes (e.g. "un-", "dis-", "re-") and suffixes (e.g. "-s", "-ing", "-able"). Prefixes occur before the root/stem word, as in "unhappy", "discontinue", "rewrite", "bicycle", or "bipolar". Suffixes occur after the root/stem word, as in "sleeping", "excited", and "desirable". Infixes are a type of bound morpheme that gets inserted into the middle of a word. For example, in "uncomfortable", the bound morphemes "un-" and "-able" are attached before and after the root word "comfort".

In English, some full-word obscenities can be transformed into other "credible" words, like the use of prefixes and suffixes to create new forms. This is an example of how bound morphemes are used to modify the meanings of free morphemes.

You also noted the concept of "circumfixes" in English, where bound morphemes are attached both before and after a root word to create a new meaning. This is similar to the example you provided of the German past participle "ge+lieb+t", where multiple bound morphemes surround the root. Suffixes, prefixes, and other bound morphemes are essential in English to complete words and convey their full meanings. These bound morphemes attach to free morpheme roots and stem to create morphologically complex words.

Topic 93

Progressiveing:-

"Progress" can mean to move forward towards a goal or improve in something. It can be used in the present tense ("make progress") or the past tense ("progressed"). The word can also be used in the infinitive form to describe the general action of advancing or moving forward. The key is that "progress" always refers to the idea of moving ahead or improving, but the tense changes depending on whether the action is happening now, happened in the past, or is being described as a general concept.

- Progressive tenses are used to show actions that take place over some time.
- Present Progressive The present progressive shows a continuing action. Such as, the horses are walking by the road or along the road.
- Present Progressive The present progressive shows a continuing action

What do you notice about the present progressive? The present progressive shows a continuing action. For example, The beaver is swimming. Here the present participle is used with the first form of the verb and ing. Notice that the present progressive has a form of the verb to be and the -ing form of the verb. Further, can you describe the caterpillar's actions using the present progressive? Such as, The caterpillar is crawling.

Past progressive refers to an ongoing action in the past. While present progressive refers to an ongoing action in the present. Both use "-ing" verb forms (e.g. "was burning", "is burning"), but the tense changes to indicate whether the continuous action is happening now or happened at some point in the past. This helps specify the timing of the ongoing activity. To conclude, the progressive form with "-ing" verbs can be used to describe continuous actions, but the past or present tense is needed to indicate when that continuous action is taking place.

Lesson No. 20

**UNDERSTANDING REGULAR GRAMMAR RULES: FROM
PLURALS AND POSSESSIVES TO PAST TENSE****Topic 094****Regular Plural:-**

The singular form of the noun "book" is "book", to make it plural, we add "s" and it becomes "books". The singular form of the noun "bag" is "bag", to make it plural, we add "s" and it becomes "bags". Therefore, the general pattern is: Singular noun + add "s" = Plural noun. This is how we form the plural for most regular nouns in English. By adding the "s" ending, we indicate that we are referring to more than one of that particular item or object. For nouns that end in -ch, -x, -s, -sh, -z, or make an 's' sound, we add '-es' instead of just '-s' to make them plural.

For example:

- Church becomes churches
- Box becomes boxes
- Gas becomes gases
- Bush becomes bushes
- Ass becomes asses

So these nouns don't just get an 's' added. We have to add '-es' to the end to correctly make them plural. The reason for this is that adding just an 's' to these ending sounds would not be pronounced properly. Adding '-es' makes the plural form sound right. For words that end in a consonant followed by the letter 'y', we don't just add an 's' to make them plural. Instead, we remove the 'y' and add 'ies' instead. For example The singular word 'factory' ends in a consonant-y, so to make it plural, we remove the 'y' and add 'ies'. The plural becomes 'factories'.

The singular word 'baby' also ends in a consonant-y, so to make it plural, we remove the 'y' and add 'ies'. The plural becomes 'babies'. For most nouns that end in a consonant followed by the letter O, we add 'es' to make them plural. For example, 'potato' becomes 'potatoes', and 'hero' becomes 'heroes'. For nouns that end in F or FE, we don't just add 'S' to make them plural. Instead, we change the F or FE to VES. For example, 'calf' becomes 'calves', 'knife' becomes 'knives', and 'leaf' becomes 'leaves'.

For some nouns, the plural is formed by changing the vowel sound, not just adding an "s". Examples: foot → feet, goose → geese, mouse → mice, woman → women, child → children, ox → oxen. In some cases, the plural adds an entire syllable, not just an "s" ending. Examples: child → children, ox → oxen. There are also nouns that have the same spelling and pronunciation for both the singular and plural forms. Examples: aircraft, deer, fish, sheep, species. Nouns borrowed from Latin or Greek sometimes keep their original plural endings. Examples: criterion → criteria, fungus → fungi, datum → data, medium → media. Some nouns, like jeans, shorts, pants, and pajamas, are always used in the plural form, even when referring to just one item. We use "a pair of" before these nouns to indicate a single item. Examples: a pair of jeans, a pair of shorts, a pair of pants, a pair of pajamas

In addition to this, Some nouns are always used in the plural, even for a single item, and require "a pair of" before them. Other nouns only have a plural form and do not have a singular version at all. These plural-only nouns still take singular verb forms, even though they end in -s. The key is recognizing that not all nouns with -s endings are actually plurals - some are just singular nouns that only come in a plural form.

Topic 095

Possessive:-

The possessive shows ownership. Possessives demonstrate something that belongs to someone or something. In other words, they "possess" something.

For example, if we want to show that a book belongs to the boy, we will say "The boy's book". The coat belongs to the girl, and that is represented as "the girl's coat". The apostrophe shows that the coat is possessed by or belongs to the girl. Similarly, "the dog's bone" indicates the bone belongs to the dog, and "the teacher's pencil" shows the pencil belongs to the teacher.

When the noun being possessed is plural, the apostrophe is placed after the plural noun. For example, "the students' jump ropes" shows the jump ropes belong to the students. The apostrophe after "students" indicates plural ownership. The key point is that the possessive shows ownership, and the placement of the apostrophe changes based on whether the noun being possessed is singular or plural. For singular nouns, the apostrophe goes before the 's', while for plural nouns, the apostrophe goes after the 's'.

There are some rules regarding the possessive.

Rule 1: For the possessive of a singular noun, add an apostrophe and s ('s) = car = car's

Rules 2 and 3: The possessive of a plural noun ending in s, add only an apostrophe (') = dogs = dogs', boy (boys), coat (coats). To form the possessive of a plural noun that does not end in s, add an apostrophe and s('s) = mice = mice's.

It shows the possessiveness of the plural. To form the possessive of a singular noun, you add an apostrophe and an 's' ('s). A noun is a word that represents a person, place, or thing. "Singular" means there is only one of those nouns. When there is more than one, it is called "plural". For example, if the singular noun "cat" has a brush, the possessive form is "the cat's brush". The apostrophes show that the brush belongs to or is possessed by the noun "cat". Further, understanding these possessive rules allows us to correctly indicate ownership and belonging when referring to the possessions of singular or plural nouns. Applying the appropriate apostrophe placement is the key to properly forming possessives.

Topic 096

Grammar Rules:-

The purpose of grammar is to provide the structural foundation for how we express our thoughts, ideas, and communication. Grammar consists of the rules that govern how we construct sentences and convey meaning through language. By understanding and applying proper grammar, we can communicate more effectively, both in speaking and in writing. Therefore, grammar is defined as a system of language rules that allows us to combine individual words to make complex meanings. We apply the rules of grammar in the production of different sentences. By applying grammar rules to your writing, you'll make it stronger, clearer, and more effective.

Grammar is a system of language rules for how words are used in sentences and change in different situations, and how we combine the sentences. It means the way sentences are constructed can vary depending on the situation and context. The grammar used in a sentence is not static but rather adapts to the specific circumstance. Grammar allows us to combine individual words to make complex meanings and communicate effectively. By learning the rules of grammar, you can write with better clarity while enjoying the freedom to make stylistic choices.

By using grammar and grammar rules we can find out what mistakes we are making in our language that spoil our language and create problems in our communication. For example. Incorrect subject-verb agreement, missing commas, and apostrophe misuse. Ultimately, grammar rules serve to guide us in using language correctly. When we miss or

incorrectly apply these grammatical guidelines, that is where grammar provides instruction. Keeping your grammar sharp is crucial, as it directly impacts the quality and effectiveness of your written and verbal communication. The grammar rules we learn provide the foundation for constructing sentences properly and conveying our thoughts and ideas.

Present polished, professional writing by improving your grammar with these basic tips. Discover how English grammar works by diving into grammar rules and learning resources. i.e. how you can use it in what is grammar i.e. the study of grammar rules while studying the language. How can you use it in a better way learning resources are also necessary for this. Research basic grammar topics. Then we should also study in research its findings in the study of different topics about the roles of grammar. The parts of speech are the fundamental building blocks of our language. In the English language, there are nine main parts of speech - nouns, pronouns, verbs, adjectives, adverbs, prepositions, conjunctions, interjections, and articles.

Each part of speech plays a distinct role in constructing meaningful, grammatically correct sentences. Without a solid understanding of these parts of speech and how to properly utilize them, our language would be incomplete and lack the structure needed for clear, effective communication. For example, verbs convey action or a state of being, adverbs modify verbs, adjectives describe nouns, and prepositions indicate relationships between words. Punctuation marks, such as commas, periods, and apostrophes, also play a critical role in organizing and clarifying the meaning of our sentences. By practicing the correct usage of these various parts of speech, as well as punctuation, we refine our grammar and avoid common mistakes. This polishes our language, ensuring our sentences adhere to proper grammatical structure with the right subject-verb-object order. Furthermore, mastering how to combine parts of speech to form compound and complex sentences allows us to construct more sophisticated communication. For example, understanding where to place commas is key to producing clear, properly structured sentences.

Grammar rules

- Verbs
- Nouns
- Pronouns
- Adjectives
- Adverbs
- Articles

- Prepositions
- Conjunctions
- Interjections

Now, look at the parts of speech in detail.

- Verbs are action words that convey what is happening or being done. They are the driving force that propels the sentence forward, describing the activity or state of being.
- Nouns, on the other hand, are the persons, places, things, or ideas that the sentence is about. Nouns provide the substance and subject matter.
- Pronouns replace nouns, allowing us to avoid repetition and maintain flow in our sentences.
- Adjectives are the descriptors that provide more detail and colour, defining the qualities, quantities, and meanings associated with nouns.
- Adverbs then modify the verbs, adding nuance to the actions being taken.
- Articles like "a," "an," and "the" are essential for properly structuring noun phrases and ensuring grammatical correctness.
- Prepositions indicate relationships of time, location, and other contextual information, positioning words in space and time.
- Conjunctions bridge sentences together, combining independent and dependent clauses into more complex constructions.
- And interjections express spontaneous emotions and reactions.

Mastering these parts of speech is crucial for developing strong language skills. By understanding how each component functions, we can craft sentences that are clear, precise, and effective in conveying our intended meaning. Furthermore, as you noted, regularly checking for common grammar mistakes, and utilizing grammar checker tools helps us identify areas for improvement. Maintaining vigilance over grammatical accuracy is key to polishing our communication, whether written or spoken. Ultimately, a comprehensive knowledge of the parts of speech and their grammatical applications empowers us to express ourselves with maximum clarity, sophistication, and impact. This mastery of language fundamentals is essential for achieving effective, impactful communication.

Topic 097**Regular Past – ed: -**

Dear Students, In this module, let's discuss how we transform verbs from the present tense to the past tense, and the specific changes we make to form the past tense. (rewrite the mentioned content) So, how do we say what is in the regular simple past such as the weight is the first form – it is weighted, the need is the first form of the verb, it becomes needed? So, in the “t form sound”, hoped, locked, sniffed, coughed, wished, kissed, etc. So, this means that we ED in it, by adding the form, we change the present to the past.

We typically add "-ed" to the end of regular verbs to make them past tense. Words like "called," "cleaned," "offered," "damaged," and "loved" all take the "-ed" ending. However, there's a special rule for verbs that already end in the letter "e." For those verbs, we don't add the full "-ed" ending. Instead, we just add a "d" to the end. For example: "Love" becomes "loved", and "Hope" becomes "hoped". We don't say "loveed" or "hopeed" - we just add a "d" to the end.

- **Rule 2:** If a verb ends in the letter 'e', you simply add a 'd' to the end to create the past tense, rather than adding 'ed'. **For examples:** Love → Loved, Hate → Hated, Arrive → Arrived, Move → Moved, Dance → Danced
- The verbs that already end in 'e' only require the addition of a 'd' to transform them into the past tense. There's no need to add the full 'ed' ending.
- **Rule 3:** If a verb ends in a consonant + the letter 'y', you add 'ied' to form the past tense. **For examples:** Cry → Cried, Copy → Copied, Study → Studied, Try → Tried.
- **Rule 4:** However, there's an important additional nuance to this rule: If the letter before the 'y' is a vowel, instead of adding 'ied', you just add 'ed': Enjoy → Enjoyed, Play → Played.
- **Rule 5:** If a one-syllable verb ends in a single consonant, with the consonant preceded by a single vowel, you only need to double the final consonant and add 'ed' to make it past tense. **For example:** Beg → Begged, Hop → Hopped, Plan → Planned.
- And when the consonant+ vowel+ consonant -stop -plan -clap we double the last consonant -stopped -planned -clapped -begged. So that means we will double this consonant to the last one and then by adding the ed, we will make it like this.

Let me summarize the main ones:

- The Standard "-ed" Rule: For most regular verbs, you simply add "-ed" to the end to make it past tense. For example: "walk" becomes "walked".
- The "-e" Rule: If a verb already ends in the letter "e", you just add a "d" instead of the full "-ed". For example: "love" becomes "loved".
- The "-y" Rule: If a verb ends in a consonant followed by "y", you change the "y" to "i" and add "-ed". For example: "carry" becomes "carried". However, if the letter before the "y" is a vowel, you just add "-ed". For example: "play" becomes "played".
- The Double Consonant Rule: If a one-syllable verb ends in a single consonant, with that consonant preceded by a single vowel, you double the final consonant and then add "-ed". For example: "stop" becomes "stopped".

Lesson No. 21

GRAMMAR IN DEPTH: THIRD PERSON SINGULAR, SUFFIXES, AND EFFECTIVE PHRASE DEVELOPMENT

Topic 98**Regular Third Person Singular- s:-**

The third-person singular -s is a grammatical rule that applies to verbs in the present tense when the subject is a third-person singular pronoun. The third-person singular pronouns are he, she, and it. Grammatically, we make this change by adding an -s or -es to the base form of the verb when the subject is he, she, or it. This is used in the present tense. The rule applies to regular verbs, which are verbs that follow a predictable pattern of conjugation in different tenses. For examples:

She goes, He goes, It goes

She eats, He eats, It eats

She writes, He writes, It writes

She loves, He loves, It loves

She cries, He cries, It cries, etc.

Rules for the 3rd Person Singular (He, She, It):-

In the present tense, regular verbs take an -s ending for the third-person singular form. This includes subjects like "he", "she", "it" or singular nouns. Examples of regular verbs in the present tense with the third person singular -s ending include talks, walks, eats, and drinks.

However, there are some additional rules for specific verb endings:

- If the verb ends in a consonant + y, the ending changes to -ies (e.g. study -> studies)
- If the verb ends in o, s, sh, ch, or x, the ending becomes -es (e.g. go -> goes, pass -> passes, wish -> wishes, catch -> catches, fix -> fixes)

In general + s	Verbs ending in conson. + y y + ies	Verbs ending in -o, sh, tch, x, ss + es
work → works	study → studies	go → goes
eat → eats	cry → cries	wash → washes
play → plays	try → tries	watch → watches
swim → swims	spy → spies	mix → mixes
write → writes	fly → flies	kiss → kisses

These modified endings for certain verb types are still part of the regular third-person singular present tense conjugation pattern.

Regular Third Person Singular -s:-

In contrast to regular verbs, irregular verbs do not follow a predictable conjugation pattern. Their third-person singular forms in the present tense are unique and must be memorized.

Examples of irregular verb third person singular forms include:

- "is" for the verb "to be"
- "has" for the verb "to have"

Infinitive	3 rd person plural preterit	3 rd person singular past Subjunctive
tomar	tomaron	tomara/tomase
beber	bebieron	bebiera/bebiese
escribir	escribieron	escribiera/escribiese
caer	cayeron	cayera/cayese
decir	dijeron	dijera/dijese
ir/ser	fueron	fuera/fuese

While regular verbs take the standard -s ending, irregular verbs have different third-person singular present tense forms. In English, the third-person singular verb form is also modified when using the passive voice. The passive voice is used when the person or entity acting is unclear or unknown.

For example, in the active voice sentence: "He writes a letter." The verb "writes" takes the third person singular -s ending because the subject is the third person singular pronoun "he".

In the passive voice version of this sentence: "A letter is written (by Akram or Ali)." The verb "is written" does not take the -s ending, even though the subject is still a third-person singular noun "a letter". This is because the passive voice shifts the focus to the object of the action, rather than the subject acting.

Further examples are mentioned below:-

In the sentence "A man was murdered yesterday in the park," the passive voice is used because the details of who committed the murder are unclear.

Newspapers frequently utilize the passive voice when reporting on events where the identity of the person or entity performing the action (the agent) is unknown or unclear.

Some other examples are mentioned below in the form of a picture.

Through these examples, we can understand the use of the third person singular in the present tense as well as the passive voice.

Forming the passive voice is fairly easy to do in

English. First you use the passive voice pronoun "es" then you use either the singular third person form (if there is only one person involved) or the plural third person form (if more than one person was involved). Examples are mentioned below in the attached picture.

-s, -es or ies?		
Verbs ending in	Third Person	Example
S	add - es	He pass <u>es</u>
Z	add - es	She wait <u>es</u>
Sh	add - es	He wash <u>es</u>
Ch	add - es	She watch <u>es</u>
X	add - es	He fix <u>es</u>
O	add - es	She go <u>es</u>
consonant+y	change Y to I, then add -ES	She stud <u>ies</u>
others	add -S	It play <u>s</u>

Present Simple Spelling Rules
Most verbs takes -s in the third person singular. (He/ She/ It)

1	- ss, -sh, -ch, -x, -o	→	-es
	I miss- he misses I finish- he finishes I watch- he watches I mix- he mixes I go- he goes		
2	CONSONANT + y	→	-ies
	I study - he studies I cry- he cries		
3	VOWEL + y	→	-s
	I play- he plays		

Topic 099

Noun and Adjective Suffixes:-

In Urdu, the word for suffixes is "Lahqay". So, Noun suffixes are added to the end of a base word to form a new noun. Examples of common noun suffixes include -ness (e.g. happiness), -ment (e.g. improvement), Here, this a verb and when we add "ment" with the verb, it become a noun, -ity (e.g. equality), and -tion (e.g. creation). We can also see different examples in the attached picture, such as: Suffixes can be used at the end of base words to change their meaning and nature.

For example, suffixes can transform verbs into nouns, or nouns into verbs. They can also create one noun from another noun. These suffixes do not have their inherent meaning, they simply modify the base word to provide a new meaning or part of speech. The suffixes themselves do not have standalone definitions, but rather serve to alter the existing base word.

Noun-forming suffixes

- | | |
|----------------|--------------------------------|
| • -er, -or | (worker, sailor) |
| • -ism | (realism, naturalism) |
| • -ist | (realist, naturalist) |
| • -ing | (building, beginning, singing) |
| • -ion, -ation | (dictation, profession) |
| • -ness | (kindness, darkness, illness) |
| • -ment | (development, movement) |
| • -ship | (friendship, partnership) |
| • -hood | (childhood, brotherhood) |
| • -ty, -ity | (liberty, activity, cruelty) |
| • -y, -ie | (daddy, birdie, auntie) |
| • -th | (streight, growth, length) |

Noun and Adjectives can also change the meaning of suffixes in base words:-

Suffixes can change the meaning of the base word. For example, adding -ness to the adjective "happy" changes it to the noun "happiness," which refers to the state of being happy. They also change adjectives to form nouns. Suffixes can also change the part of speech of the base word. For example, adding -ment to the verb "improve" changes it to the noun "improvement." Further, more examples are cited in the below image.

nouns ending in -ion	attract → attraction
nouns ending in -ation	reserve → reservation
nouns ending in -ance	allow → allowance
nouns ending in -ant	assist → assistant
nouns ending in -cy	agent → agency
nouns ending in -ity	popular → popularity
nouns ending in -ness	dark → darkness
nouns ending in -ence	confide → confidence

The mentioned word "assist" changed to assistant or assistance. Thus, we use them in conjunction with base words to change meanings.

Adjective suffixes:

They are added to the end of a base word to form a new adjective. Examples of common adjective suffixes include -ful (e.g. careful), -able (e.g. comfortable), -ous (e.g. dangerous), and -y (e.g. funny). If we use adjective suffixes, we can change the meaning of words in the language. By making these changes, we can develop and improve the language over time. Suffixes can change the meaning of the base word. For example, adding -ful to the noun "care" changes it to the adjective "careful," which means showing care or caution.

Suffixes that Makes Adjective		
Prefixes	Meaning	Examples
-ive	quality or nature of	cooperative, sensitive
-less	without anything	colorless, selfless
-like	similar to, alike	cloudlike, childlike
-ous	full of	advantageous

Suffixes can also change the degree of comparison of the adjective. For example, adding -er to the adjective "tall" forms the comparative form "taller," while adding -est forms the superlative form "tallest." Other examples are stated in the image.

LIST OF COMMON SUFFIXES ADJECTIVE SUFFIXES		
Suffixes	Meaning	Example
-ive	having the nature of	creative
-able, -ible	capable of being	edible
-less	without	endless
-ful	notable for	fanciful
-ish	having the quality	fiercish
-ic, -ical	pertaining to	musical
-ious, -ous	characterized by	nutritious
-esque	reminiscent of	picturesque
-al	pertaining to	regional
-y	characterized by	sleazy
-ive	having the nature of	creative

The use of suffixes in language has various characteristics. Suffixes can not only change adjectives into nouns or verbs into nouns, but they can also alter the degrees of adjectives. It is important to note that not all nouns and adjectives can have suffixes added to them, and not all suffixes can be applied to every word. Additionally, some suffixes can have multiple meanings and uses, depending on the context and content in which they are used. So in summary, suffixes provide a versatile way to transform the parts of speech and degrees of words, but their usage is constrained by the specific rules and distinctions of the language.

Topic 100

Phrase Development:-

Phrase:

A phrase is a group of two or more words functioning as a meaningful unit within a sentence. So, In grammar, a phrase called expression in some contexts is a group of words or a singular word acting as a grammatical unit. Grammar refers to the principles or special rules that govern how words are used, both individually and in combination, to form sentences and other meaningful units of language. These rules order how the different words are used, whether singly or in combination, to create sentences and other linguistic units. For instance, the English expression "the very happy squirrel" is a noun phrase that

Phrase Definition and Examples				
Noun Phrase: The tiny mouse	Verb Phrase: was reading	Adjective Phrase: very tall	Adverb Phrase: only occasionally	Prepositional Phrase: on the table
				
Phrase: a group of two or more words functioning as a meaningful unit within a sentence or clause.				

contains the adjective phrase “very happy”. The phrase can consist of a single word or a complete sentence. Phrases are distinct from single-word parts of speech. There are different types of phrases, including verb phrases, noun phrases, adjectival phrases, adverb phrases, and prepositional phrases. Each of these phrase types is composed of multiple words that function together as a single unit within a sentence.

When constructing sentences, we need to consider how these different phrases are used and how they relate to one another. For example, the subject and object of a sentence connect the various phrases and parts of speech to create a complete, grammatically correct statement.

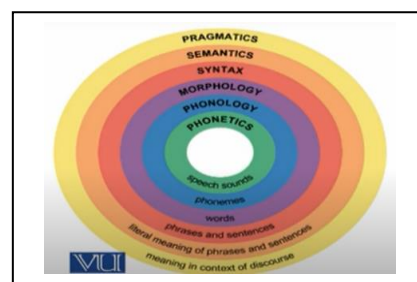

Phrase Development:

This refers to the process of constructing and refining a group of related words that form a meaningful unit in a sentence, often serving a specific grammatical function. In the English language, sentences are constructed by combining the proper sequence of subject, verb, and object. This subject-verb-object structure forms the basic foundation for creating grammatically correct statements. Beyond just the core subject, verb, and object elements, different parts of speech are also used to convey additional meaning and modify the relationship between the various components of a sentence. Things like nouns, adjectives, adverbs, prepositions, and others all play a role in shaping the overall sense and structure of a sentence.

Phrases can include a variety of words such as nouns, verbs, adjectives, adverbs, and prepositions, and can be used to modify, complement, or complete other parts of a sentence regarding the meaning, and in the sense of the sentence. The development of a phrase involves selecting appropriate words that convey the desired meaning, arranging them in a logical order, and ensuring that the phrase is grammatically correct and fits seamlessly into the larger context of the sentence.

If we look at phonetics, it is about the actual sounds we make when we speak. These are the basic building blocks of language. Phonology deals with how those speech sounds are organized into words in a language. Morphology looks at the structure of words - how smaller meaningful parts (morphemes) combine to form words. Syntax focuses on the grammatical rules for arranging words into proper phrases and sentences.

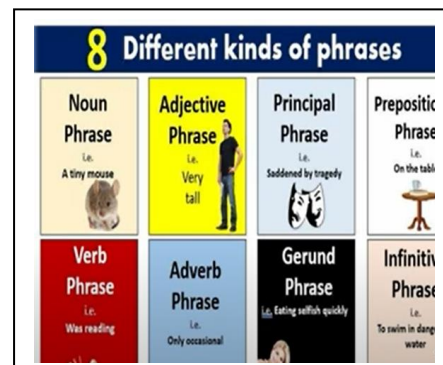

Effective phrase development is important in creating clear and coherent sentences that effectively convey the writer’s intended message. If the language speaker uses his

grammar correctly and combines the phrases of the correct sentences, then he can communicate his intended message and he can tell or explain.

Here are some examples of phrases:

- Once in a blue moon
- Piece of cake
- Bite the bullet
- Break a leg
- Cat got your tongue?
- Close but no cigar

You may also learn and see different examples of different kinds of phrases through the mentioned image.

Adjective phrases are used to describe the noun. They tell us about the qualities or characteristics of the thing or person we're talking about. Verb phrases, on the other hand, tell us about the action or state of being. They explain what the subject is doing or experiencing. While adverb phrases then add more information to the verb. They tell us how, when, where, or to what extent the action is happening. In addition to explaining the different types of phrases (adjective, verb, and adverb), I also provided some examples to make it clearer. Knowing the correct grammar rules and how to properly combine words into phrases and sentences is important. This allows us to use language in the right way and convey meaning effectively.

Topic 101

Noun Phrase Development:-

Noun phrase development is the process of making a noun phrase, which is a group of words that function as a noun in a sentence. This involves selecting the appropriate noun and modifying it with determiners, adjectives, or other nouns to provide more information about the noun's identity or characteristics. Noun phrase development is an essential aspect of sentence construction and is crucial in conveying the intended meaning of a sentence. An essential form of communication is a speech or presentation, in which a speaker aims to convey their desired messaging and information to an audience.

Noun phrase: It uses words to describe and specify.

What is Phrase?

A phrase is a group of related words that does not contain a subject and predicate combination to form a complete sentence or convey information, but it still functions as a unit in the sentence. It can be a noun phrase, verb phrase, adjective phrase, adverbial phrase, preposition phrase, or infinitive phrase. So, this means that all phrases can be used to complete a sentence. A compound head consists of a compound noun, which consists of a noun head with another item (most typically a noun, but it may also be an adjective or verb) placed before it in a very close syntactic and semantic relationship. Dependent elements pre-modifiers an, the, this, all, any, some. So, we also use them in these noun phrases.

What are Pre Modifiers?

Post modifiers are grammatical structures that follow a noun or pronoun and provide a clarification and explanation about the phrase. They basically change or modify the meaning of the sentences. They usually consist of phrases, clauses, or prepositional phrases that describe the noun or pronoun in more detail.

Example of Phrase:

In the sentence “The man with the hat walked down the street” the post modifier is “with the hat” which provides more information about the man, and it also describes one quality of the man. While, in the sentence, “The book on the table is mine” the post modifier is “on the table” which describes where the book is located. Further examples of phrases are mentioned in the attached picture. So, all these examples belong to the use of noun phrases in sentences or language as a figurative language. It means that used in a literary language and does not have literal meaning. **Type of**

Phrase

- Noun Phrase
- Adjective Phrase
- Adverb Phrase
- Verb Phrase
- Prepositional Phrase

All these phrases use their meanings and functions in the sentence. Sometimes, they are used to clarify the idea and add in the meaning of the verbs.

For example, I walk slowly. Here, slowly is an adverb, which adds to the meaning of the verb.

How to use Phrase? Rules and Points to Remember:

- There are some things that you have to remember when using phonetics.
- Phrases are just a part of the sentence and cannot stand alone. They convey meaning when they are a part of the sentence.
- They do not give complete meaning if taken out of context.
- They are mostly used to provide extra information about the subject, object, or other component in a sentence. i.e., in whatever sense it is being used, they add to its meaning, clarify it, change it, change it, and clarify it in whatever sense it is being used.
- There can be more than one phrase in a sentence.
- Make sure that the phrase gives your sentence clarity and does not simply accumulate the sentence with information.

Therefore, it is the use of the phrase and how to use different phrases with basic noun phrases. happens how we use it in context and how we can use it further to improve our language.

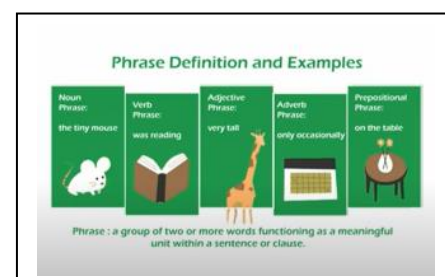

Lesson No. 22

FROM PHRASES TO SENTENCES: UNDERSTANDING VERB, PREPOSITIONAL, INFINITIVE, AND GERUND PHRASES

Topic 102

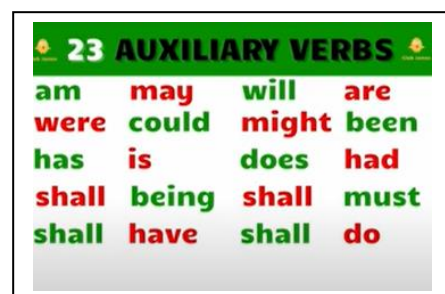

Verb Phrase Development:-

A verb is an action word that shows you doing or having something. So, a group of two or more words functioning as a meaningful unit within a sentence or clause is called a phrase. A verb phrase is a group of words that includes a main verb and any auxiliary (helping) verbs that come before or after it. The main verb in a verb phrase indicates action or state of being in the sentence. Examples of common main verbs include “run”, “eat”, “sing”, “sleep”, and “study”. We utilized various types of phrases within the verb phrases, such as noun phrases, prepositional phrases, adverb phrases, and other phrasal constructions. It is important to note that not just a single phrase is employed, but rather a combination of different phrases.

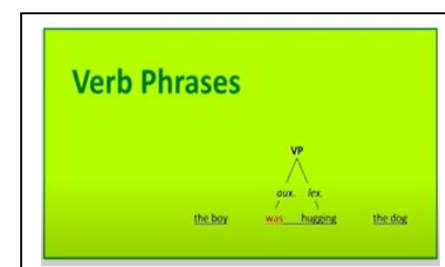

Verb Phrase Development:

Auxiliary verbs are used from different tenses, moods, and voices in English. Examples of common auxiliary verbs include “be”, “do”, “have”, “will”, and “can”. The image provides further examples of the different types of phrases used in verb phrase development. Additionally, it discusses the importance of verb tense, which is conveyed using auxiliary verbs in conjunction with the main verbs. This allows for more nuanced expression of meaning and temporal aspects within the verb phrases.

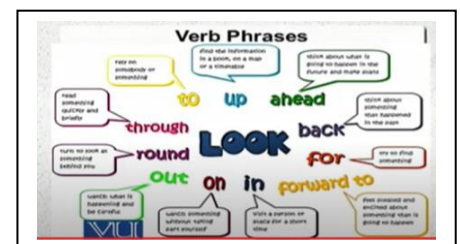

The placement of auxiliary verbs in a verb phrase can vary depending on the tense or mood of the sentence. For example, in a sentence using the present perfect tense, the auxiliary verb “has” comes before the past participle of the main verb, as in “I have eaten”. In the case of past participle verb forms, such as “eaten”, the auxiliary verb “have” is used before the main verb. However, if the subject is a singular pronoun like “he” or “she”, then the auxiliary verb changes to

"has" instead. So the verb phrase construction can be adjusted based on the specific pronoun used as the subject. Verb phrases can be developed by using different main verbs and auxiliary verbs to convey different meanings and nuances. For example, "She is singing" uses the present tense of the main verb "sing" and the auxiliary verb "is" to indicate that the action is happening in the present.

Understanding verb phrase development is important for clear, effective and accurate communication in written and spoken English. By using different combinations of main and auxiliary verbs, speakers, and writers can convey a wide range of meanings, and express different tenses, moods, and voices.

As shown in the image, the verb "look" can take on different meanings when combined with various auxiliary verbs and prepositional phrases. This shows how using auxiliary verbs, verb tenses, and prepositional phrases in verb phrase construction allows for conveying more complex and nuanced meanings. By thoughtfully combining these different elements, one can build rich and expressive sentences to communicate effectively.

The below pictures mention some other small phrases that kids can use. As children are learning a language, these simpler phrases can help them express their thoughts and ideas.

Topic 103

Prepositional Phrase development:-

A preposition relates the noun or pronoun following it to another word in the sentence. It relates to the words in a sentence shows their relationship and explains what type of relationship. The choice of prepositions affects the way the other words in a sentence relate to each other. The image shows that the development of prepositional phrases occurs at a certain age range during a child's language acquisition.

AGE	PREPOSITIONS
1-2 YEARS	- FOLLOWS SIMPLE DIRECTIONS: IN, ON, UP, AND DOWN - USES UP, DOWN, ON, IN, AND UNDER
2-3 YEARS	UNDERSTANDS IN, OFF, ON, UNDER, OUT OF, TOGETHER, AND AWAY FROM
3-4 YEARS	- UNDERSTANDS NEXT TO, BESIDE, AND BETWEEN - USES BEHIND, IN FRONT, AROUND
4-5 YEARS	UNDERSTANDS DIFFERENT, NEAREST, AND THROUGH
5-6 YEARS	- UNDERSTANDS OPPOSITES SUCH AS OVER/UNDER - USES THROUGH, NEAREST, CORNER, MIDDLE

A prepositional phrase is a group of words that begins with a preposition and ends with a noun or pronoun. It is called the object of the preposition. So, prepositions are words that show the relationship between a noun or pronoun and other words in a sentence e.g., “in”, “on”, “under”, “with”, “by” and “to”

Further, prepositional phrases can be developed through the preposition + Modifier (s) + Object of the preposition.

Prepositional phrases can be used to provide additional information about the noun or pronoun in the sentence. For example, “The book on the shelf” provides information about where the book is located, “The book under the table”, and “The glass of water on the table”. So, all these prepositions tell us about or give information about the noun and pronoun. Prepositional phrases can also be used as adjectives or adverbs in a sentence. When used as an adjective it modifies a noun, as in “The man in the blue shirt”. Here the blue shirt is an adjective. When it is used as an adverb it modifies a verb, as in “She walked to the store slowly”, “The child walked to the school slowly”, or “The child ran Fastly”. Here, slowly, and Fastly are adverbs that add in the meaning of the verbs.

Prepositional phrases can be developed by using different prepositions and objects of the prepositions. For example, “in the box”, “on the table”, and “under the bed” are all prepositional phrases. Other examples of prepositional phrases (In, On, At) are stated in the picture. All these phrases are related with prepositions and modify the difference and change the meanings. Further, these prepositional phrases look like idioms.

IN	ON	AT
• in time	• on average	• at any cost
• in demand	• on bail	• at any rate
• in of focus	• on behalf of	• at breakfast
• in of prison	• on board	• at ease
• in of season	• on business	• at face value
• in of stock	• on credit	• at fault
• in of touch	• on display	• at full strength
• in of use	• on edge	• at hand

Grammar – Prepositional phrases – usage:-

It is important to use prepositional phrases correctly to convey clear and correct meaning in the English language. Understanding the relationships between words, and prepositional phrases can help to improve language proficiency.

Topic 104

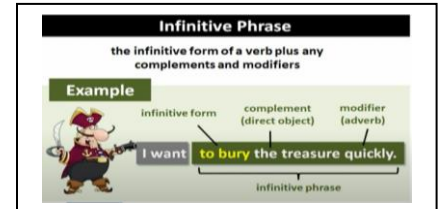

Infinitive Phrase Development:-

The Urdu term for the infinitive is "Masdar". What is an infinitive? An infinitive phrase is a group of words that begins with the infinitive form of the verb (e.g. “to run”, “to eat”, “to sing”) and may include any objects or modifiers that come after it. Infinitive

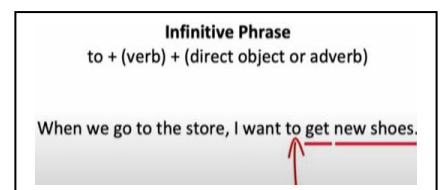

phrases can function as nouns, adjectives, or adverbs in a sentence, depending on their placement and use. An infinitive phrase is formed from the word “to” together with the base form (present tense) of a verb. For example, to stake, to write, to shimmer, to see, to stop, and to use, etc.

When is used a noun, an infinitive phrase can act as the subject or object of a sentence or as the object of a preposition. For example, “To learn a new language takes time” uses the infinitive phrase “to learn” as the subject of the sentence. When it is used as an adjective, an infinitive phrase modifies a noun or pronoun in a sentence.

For example, “The book to read is on the shelf” uses the infinitive phrase “to read” to modify the noun “book”. When used as an adverb, an infinitive phrase modifies a verb, adjective, or adverb in a sentence. For example, “He walked to the store to buy some milk” uses the infinitive phrase “to buy some milk” to modify the verb “walked”.

Topic 105

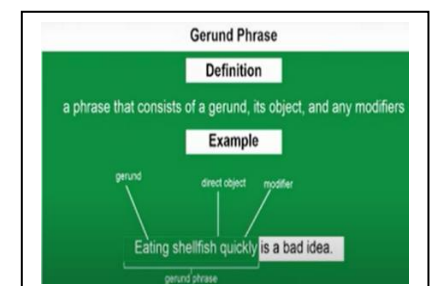

Gerund Phrase Development:

A gerund is a form of a verb that ends in -ing and functions as a noun in a sentence. For example, “Swimming is my favorite hobby” uses “swimming” as the subject of the sentence.

How can we use gerund phrases in different ways. For example:

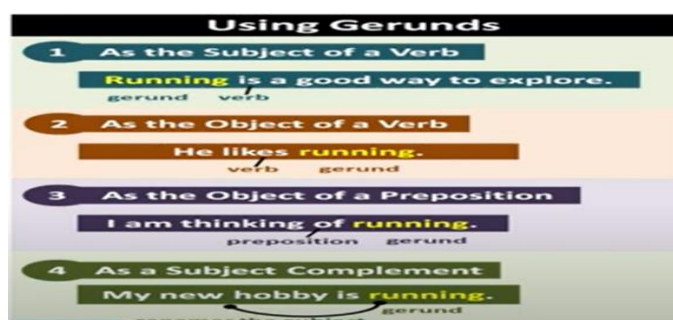

- Thinking critically is a skill
- Speaking multiple languages is impressive
- Petting the Dog
- Calling a friend
- And watching Movies

Each phrase or sentence starts with the gerund, which emphasizes the ongoing nature of the actions. Therefore, a gerund phrase is a group of words that include a gerund and any modifiers or complements that come after it. **For example,** “Reading books on the beach” is a gerund phrase that includes the gerund “reading” and the object “books” the prepositional

phrase “on the beach”. In these examples, the gerund forms are being used to combine different phrases and convey more information. Gerund phrases can be used as subjects, objects, or complements in a sentence, just like other noun phrases". For example, “His favorite hobby is swimming” uses “swimming” as the complement of the verb “is”.

Gerund phrases can also be used as the object of a preposition, such as in “She is interested in traveling to new places”. Gerund phrases can be developed by using different verbs in the gerund form, as well as by adding modifiers (ing) or complements to the phrase. Let's take a look at the different dimensions of the gerund phrases that are mentioned:

By using gerund phrases effectively, speakers and writers can add variety and complexity to their language, as well as convey different meanings and hints. The additional examples provided show how the gerund phrase can be used in diverse ways to convey different meanings and senses such as;

Topic 106

Sentence Development:- What is a sentence?

A sentence is a group of words that expresses a complete thought and typically includes a subject and predicate. It means a complete sense and idea is conveyed by the sentence. A simple sentence consists of one independent clause, which contains a subject and a predicate and expresses a complete thought. For example, “I am going to the store”. As, the construction of a sentence provides a comprehensive representation of an individual and their actions.

Further, when analyzing a sentence, it's important to consider the fundamental rule of sentence structure - the subject, verb, and object. Breaking down a sentence into these core components is a critical step in understanding its meaning and construction.

A compound sentence consists of two or more independent clauses that are joined by a coordinating conjunction (such as “and”, “but”, “or”). For example, “I am going to the store”, but I will be back soon. The example mentioned is actually a compound sentence, which is the combination of two independent clauses.

A complex sentence has an independent clause and at least one dependent clause joined by a subordinating conjunction like “because”, “although”, or “if”. For example, “Because I am going to the store, I will be back soon”. The compound sentence we've been discussing is a combination of two independent clauses that have been joined together. A compound-complex sentence has two or more independent clauses and one dependent clause. For example, “I am going to the store, but will be back soon if I can find what I need”. Here, you can see two independent clauses and one dependent clause used in the sentence.

Below is an explanation of the subject and predicate within the context of a clause. This analysis demonstrates that every sentence is fundamentally composed of a subject and a predicate.

CLAUSE		
SUBJECT	PREDICATE	
	MAIN VERB PHRASE	OBJECT / COMPLEMENT / EXTRA INFORMATION
- noun phrase or pronoun - verb with no tense (verb-ing / to verb) 'It' / 'There' 'that' clause (that + subject + predicate) - noun clause (question word + subject + predicate)	verb phrase with tense (must 'agree' with the subject)	- verb with no tense (verb-ing / to verb / verb-ed) - preposition phrase - adjective phrase - noun phrase or pronoun - adverb - noun clause

Sentence development can be improved by many factors:

- Child's cognitive and linguistic abilities. These abilities vary from child to child. If the cognitive and linguistic abilities of the child are good, then his/her language will develop very fastly.
- Social and cultural environment. The environment of the school, community, and the culture where he/she is learning in any organization. So, both environments can play an important role in the language development.
- Strong working memory. If a child has a strong working memory, then language will also develop at the highest speed or rate.

- And using suitable punctuation to make clear and complex sentences.

Understanding sentence development is important for clear and effective communication. By mastering different sentence structures speakers and writers can convey different meanings, through various forms of language. Because words have different meanings and lyrics, according to the context and create meaningful, effective communication by using different forms of language.
