MB501P-Short Questions:

Whatsapp: 03196386297

Question No-1: Write down the names of smallest and largest bacteria.

Answer: Mycoplasma and Coxiella are the shortest among bacteria and Spirochetes are the longest bacteria.

Question No-2: Write down the names of different types of microscopes.

Answer: Simple microscope, Compound microscope, Dark ground microscope, Phase contrast microscope, Fluorescent microscope, Interference microscope, Electron microscope, Atomic force microscope, Polarization microscope.

Question No-3: Where is a microscope commonly used? And which one is the most commonly used microscope?

Answer: A microscope is commonly used in a microbiological study of organisms. The basic modern microscope found in schools, hospitals, and research centers is a compound microscope which has a series of lenses to collect and focus the light transmitted through the specimen.

QNo-4: Write down the names of various parts of a microscope.

Answer: Tube, Eyepiece or ocular lens, Revolving nosepiece, Objective lenses, Diaphragm, Coarse adjustment knob, Fine adjustment knob, Arm, Stage, Stage clip, Condenser, Base, Power switch.

QNo-5: What is Differential staining technique?

Answer: Differential stain technique distinguishes two kinds of organisms.There are two types of this technique. One is gram stain technique while the other is acid fast technique.

QNo-6: Mention Reagents which are used in Gram staining.

Answer: Primary stain = Crystal violet

Mordant = Gram's Iodine

Decolourizer = Ethyl Alcohol

Secondary stain = Safranin

QNo-7: What are plasmids?

Answer: Extra chromosomal piece of DNA. Plasmids are often the sites of genes that code for resistance to antibiotics.

QNo-8: What are plastids and write the names of different types of plastids.

Answer: Plastids are double membrane bound organalles found inside plants and some algae, which are primarily responsible for activities related to making and storing food. Some of the most common plastids include, chloroplasts, chromoplasts, gerontoplasts and leucoplasts.

QNo-9: Briefly describe Gerontoplasts.

Answer: They are basically chloroplasts that are going through the aging process. These are chloroplasts of the leaves that are beginning to convert into different organelles since the leaf is no longer utilizing photosynthesis.

QNo-10: Discuss role of proteinoplasts and elaioplasts.

Answer: Proteinoplasts help to store the proteins that a plant needs and are especially found in seeds. While the elaioplasts are used to store fats and oils that are needed by the plant especially in seeds.

QNo-6: Mention Reagents which are used in Gram staining.
