Cs625 GDB Solution Fall 2024

Graded Discussion Board (GDB) will open on **Wednesday, 20th November, 2024 at 12:00 AM** and it will remain open for **TWO** days. You can post your answer by **Friday, 22nd November 2024 till 11:59 PM.**

Fall 2024 – CS625 - GDB

Graded Discussion Board Topic

You are the Operations Director at a medium-sized software House. Your company just landed a big project with a tight deadline, and the client expects top-quality work with all the necessary features. However, your team is already busy with other projects, and there"s concern that people might get overwhelmed or burned out. To make things more complicated, a few key team members have planned time off next month, which could impact the timeline for this new project.

Question: Do you consider bringing in temporary contractors to help with the workload, even if it means slightly increasing the project budget? You need to justify your answer with three or two lines.

Kindly follow the template given below:

1. Yes, temporary contractors should be utilized.

2. No, temporary contractors should not be utilized.

Solution:

CS625 GDB Solution

CamScanner

Your choice: Yes, temporary contractors should be utilized.
Reason 1: It ensures timely delivery of the project without overburdening the existing team, maintaining quality standards.
Reason 2: The slight increase in budget is justified to meet client expectations and avoid potential penalties or dissatisfaction.

Cs311 GDB Solution Fall 2024

Whatsapp:03016812299

Dear Students!
Graded Discussion Board (GDB) of CS311 will launch on Thurssday, Nov 21, 2024, at 12:01 AM and close on Friday, Nov 22, 2024 at 11:59PM.

We are giving many days to complete this graded task. So, be prepared because the due date of GDB will not be extended in any case.

GDB Scenario:

Question

In XML, you can store data using either **elements** or **attributes**, but each has its own use cases. Elements are typically used to hold large or complex data, while attributes are best for storing simple data or metadata about the element. Consider the following two approaches for representing a product in an XML document: one uses an **element** to store the product"s price, while the other uses an **attribute**. Discuss which approach is more appropriate for this case and explain why, considering factors such as clarity and the nature of the data.

1: Using XML Elements

<product>

<name>Smartphone</name>

<price>499.99</price>

CamScanner

</product>

2: Using XML Attributes

<product name="Smartphone" price="499.99"/>

Solution

Your choice: Using XML Elements.
Reason 1: Elements provide better readability and are suitable for large or complex data like price values.

Reason 2: They maintain clarity in the document's structure and are more extensible for future modifications.

Cs614 GDB Solution Fall 2024

Whatsapp: 03016812299

Graded Discussion Board (GDB)

Dear Students,

The Graded Discussion Board (GDB) of CS614 has been posted on VULMS in the GDB Section. It will open on **Wednesday, 20 November 2024**, and remain open for 48 hours (02 days). You can participate in the discussion from **20 November 2024 to 21 November 2024**.

GDB Scenario:

ABC Mart, a large retail chain with stores across various cities in Pakistan, aims to track and analyze its sales data to make strategic business decisions. This analysis

CamScanner

includes monitoring weekly sales trends, understanding customer buying patterns, comparing product performance across different regions, and forecasting future demand. To meet these goals, ABC Mart needs a database solution that supports fast, multi-dimensional queries and can efficiently summarize large volumes of historical sales data.

Question:

Considering the given scenario, which modeling technique—ER modeling or DM modeling—would you choose for data analysis and why? Give your answer with one solid reason.

Solution

Your choice: DM (Dimensional Modeling).
Reason: DM supports fast, multi-dimensional queries and provides summarized views for analyzing large volumes of historical data efficiently, which aligns with ABC Mart's requirements.

Cs603 GDB Solution Fall 2024

Whatsapp:03016812299

Dear Students,

Graded Discussion Board (GDB) will **open** on **20th of November 2024** and **close** on **22nd of November 2024**. Please follow the given instructions to attempt the GDB answer.

Consider an online banking system that manages different types of user accounts, such as personal, business, and premium accounts. This system has functionalities like viewing balances, making transactions, applying for loans, and managing

CamScanner

investments. Based on the different types of user accounts, for example the personal account should provide relatively simple transaction and balance functionalities in terms of payroll and other expense management as compared to the business or premium user account holders. The system is supposed to support the emerging financing options like the ability to trade in cryptocurrency where its coding can be added without any risk of encountering bugs in the existing features.

Based on the given scenario you are required to identify the SOLID principle(s) that are more applicable or relevant to the context of this scenario? Being an IT professional, Justify your answer with reasonable arguments.

Select the most favorable type(s) of SOLID principle(s) for the above scenario with a proper justification:

1) Single Responsibility Principle (SRP)
2) Open/Closed Principle (OCP)
3) Liskov Substitution Principle (LSP)
4) Interface Segregation Principle (ISP)
5) Dependency Inversion Principle (DIP)

Solution

Your choice: Open/Closed Principle (OCP).
Reason 1: OCP allows the system to accommodate new functionalities, like crypto currency trading, without modifying existing code.

Reason 2: This reduces the risk of introducing bugs while maintaining the robustness of the current system.

CamScanner

Whatsapp:03016812299

Dear Students!

Graded Discussion Board (GDB) of CS304 will open on Thursday, Nov 21, 2024, at 12:01 AM and it will close on Friday, Nov 22, 2024 at 11:59PM.

GDB Scenario:

An XYZ university has different campuses in different cities across the country. Suppose you, as a C++ programmer, are assigned a task to write a C++ program that contains a class **Staff** to manage the number of active staff members in the university. The **Staff** class should include functionality to track the total number of staff members across all campuses of the university as well as tracking number of staff numbers specific to each campus.

The approach of static and non-static data members be used to implement different aspects of the given functionality. Explain which aspect(s) of the scenario would be better suited for a static data member and which would require a non-static data member. Also, discuss the impact of these approaches on factors: consistency across all campuses, memory efficiency, encapsulation and flexibility.

Solution

Static Data Members: Should be used for tracking the **total number of staff members** across all campuses to ensure consistency.
Non-Static Data Members: Should be used for tracking the **number of staff members at individual campuses**, allowing flexibility and encapsulation.

Impact:

- **Consistency**: Static members ensure uniform tracking across all campuses.

CamScanner

- **Memory Efficiency**: Static members save memory as they're shared across all instances.
- **Encapsulation & Flexibility**: Non-static members allow campus-specific data management without affecting others.

Cs601 GDB Solution Fall 2024

Whatsapp:03016812299

Dear Students,

Graded discussion will be launched on **November 19, 2024** and it will remain open for two days. You can post your comments on VU-LMS about below mentioned topic/scenario till **November 20, 2024**.

Scenario

A UK based company is designing a data communication system for a smart building. The system will transmit real-time sensor data, like temperature, motion, and lighting levels, across various floors using copper cables. Reliability and efficient use of bandwidth are critical because the building has hundreds of sensors sending data continuously. Additionally, the setup must handle occasional electromagnetic interference from nearby machinery.

Given these requirements, would you choose line coding or block coding to encode the data? Justify your choice based on the system"s needs for synchronization, reliability, and bandwidth efficiency.

Note: Your Solution should be in following format:

CamScanner

Your choice: (Block Coding or Line Coding)

Reason 1: _____

Reason 2: _____

Solution

Your choice: **Block Coding.**

Reason 1: It offers better synchronization and error detection, which is critical in a setup with potential electromagnetic interference.

Reason 2: Block coding ensures efficient bandwidth usage while maintaining data reliability across the smart building's network.

CamScanner
