

PSY502 SHORT NOTES By PIN2

LESSON 06

Renaissance

Renaissance is a French word meaning “rebirth” it is the period between 13th to 16th centuries AD. The term Renaissance is used to describe the development of western civilization that marked the transition from medieval (middle age) to modern times.

RENE DESCARTES

- He originated the Cartesian coordinates and Cartesian curves; he is often said to be the founder of analytical geometry.
- He discarded tradition and supported rationalization and logic rather than ideas based upon experiences.
- Emotion was finally physiological at base and argued that the control of the physical expression of emotion would control the emotions themselves.
- Descartes’s main method of acquisition of knowledge was to doubt everything called skepticism (doubt the truth of something). Descartes had come to the conclusion that he could doubt everything except his thinking. Rene Descartes went on to say that because he thinks therefore he exists. Descartes gave his conclusion as a French term: “Cogito ergo sum.” It means that “I think therefore I am.”
- The two parts of the human beings are:
 - The part that thinks
 - The part that acts
- He proclaimed that the body is like a machine that obeys the orders of the mind body and soul dualism.
- The soul affects the body by a gland that he called “Pineal Gland.”
- Two types of thoughts:
 - Innate thoughts (by birth)
 - Acquired thoughts (experience)

LESSON 07

THOMAS HOBBS (ASSOCIATIONIST)

- Materialist thinkers were of the view that matter is dynamic, which means that matter changes from one form to another.
- This idea of finding similarities between man and machines given by Thomas Hobbes is called “mechanical materialism.”
- Empiricism
- He further proclaimed that motion in the brain creates thoughts.

- According to Hobbes **three things create association**:
 - Habits
 - Wishes
 - Repetition
- Hobbes was of the opinion that our thoughts and emotions are caused by the motion the external stimuli
- He wrought a book **“Leviathan”**.

JOHN LOCKE (ASSOCIATIONIST)

- He is considered to be the founder of British Empiricism
- Tabula rasa
- According to Locke, we learn by two ways:
 - a) Sensations
 - b) Reflection
- Empiricism

LESSON 08

DAVID HUME (ASSOCIATIONIST)

- His first philosophical book, **Treatise of Human Nature**
- **Empiricism**
- **Cause and effect**
- **Utilitarian approach** according to which knowledge must serve life and it must have a purpose.
- Hume denied the existence of material world(**things exist as long as we see them**)
- Hume also **distinguished between violent passions and calm passions**.
 1. Violent passions for example are love and hate
 2. calm passions are aesthetic and moral feelings
- **Pragmatism** which means that everything has to have a practical application and reason concept of James which David Hume called as utilitarian approach

FRENCH REVOLUTION

One of the greatest revolutions in the history of mankind is **the French Revolution that took place in France in 1789**. Violent revolt against the government marking the end of monarchy and feudalism in France

Denis Diderot

- **Empiricism**

- He was of **materialist point of view** proposing that matter is dynamic and the movement of particles creates sensations and feelings in a body
- **Memory** is the functions of the brain and man and animals possess memory.
- He further proclaimed that the purpose of **knowledge** was not just to know the truth but it was to increase the **power of man**.

Augusta Comte

- He is considered as the founder of the school of philosophy known as **positivism Comte** is also considered as the **first Sociologist**
- There is **no difference in the chemical elements** of trees, animals and man.
- He also said that scientists should avoid moral or ideological judgments which make their study **biased**
- He wrought a book, "**the Course of Positive Philosophy**
- **No cause and effect**. He purported that we should gather information and then tries to formulate connections between different pieces of information or facts gathered.
- There **are three stages of growth and development**.
 - a) 1st This was when man explained and understood events by referring to the super natural, gods and spirits
 - b) 2nd This stage was when man explained events in mechanical terms
 - c) 3rd It was when man understood and explained events in a deterministic way

LESSON 09

WILHELM LIEBNIZ

- **First German philosopher/psychologist**
- He called **atom as Monads**. Monads are spiritual in nature and they are permanent and indestructible
- That he proposed that the soul and the body exist and operate parallel to each other. This view of parallelism of soul and body is termed as **psycho-physical parallelism**.

IMUNEL KANT

- Believed in **empiricism**
- Support concept of **association**
- Kant proposed that mind has the capacity to give **meaning to sensations** and observation mind is responsible for interpreting these sensations and deciding how the person and the body have to react.
- No material existing of mind
- Psychology cannot be a science

FRIEDRICH HEGEL

- Hegel taught that there is no **conflict between mind or wisdom** and nature or matter.
- All phenomenons have a **cause and effect relationship** or may otherwise be explained using simple methods of observational reasoning.
- Absolute idea is the **absolute truth** and it is non-material (other ideas derive from it).
- Objects and events cannot be studied separately. Hegel correctly and implicitly stated that the behavior of a person, his attitude and his **actions are influenced by his environment.**
- The **dialectical process** means that by looking at two things, i.e. the object and the ideas we can draw conclusions about them.
- Three **stages of development of thoughts**
 1. Thesis (generation of idea)
 2. Antithesis (opposite idea)
 3. Synthesis (two ideas merge to form new idea)

LESSON 10

IVAN SECHENOV

- **Industrial Revolution**: The first really practical **engine** was invented by the Scotsman **James Watt** in about 1775.
- Ivan was physiologist, named by **Ivan Pavlov** as "The Father of Russian physiology."
- Sechenov authored major classic "**Reflexes of the Brain**" introducing **electrophysiology** and **neurophysiology** into laboratories and teaching of medicine
- He showed that brain activity is linked to electric currents and was the first to introduce electrophysiology.
- His work laid the **foundations** for the study of reflexes, animal and human behavior, and **neuroscience.**
- Unity of body and soul. **No dualism**
- The behavior of the person is the response to the physiological change (**sensory stimulation**) according to how the brain acts to that physiological change (candle example).
- There are parts of brain which decides either to show response or not

LESSON 11

IVAN PAVLOV

- One of the greatest achievements of Ivan Pavlov was his **research on digestive glands** of human beings

- Ivan Pavlov has the honor of being the first and only psychologist who has ever received a **Noble Prize**
- Ivan Pavlov see the **linkage of physiology and psychology**.
- He gave the concept of **learning by conditioning**
- **Reflex** (unlearned action)
- **Conditional response** (response caused by conditional stimuli)
- **Unconditional response** (response given in result of unconditional stimuli)
- **Conditioned stimuli** (neutral stimuli associated with unconditional stimuli)
- **Unconditional stimuli** (a stimuli which cause unlearned response)
- Some principles of learning are as follows:
- **Acquisition** (action learned if reinforced)
- **Extinction** (if not reinforced action disappear)
- **Spontaneous recovery** (if reinforced after extinction action recovers)
- **Generalization** (generalization of stimuli)
- **Discrimination** (discrimination between stimulus)

LESSON 12

VLADIMIR BEKHTEREV

- Bekhterev is his experiments on animals and humans using mild **electric shocks** to trace the effect on learning. Withdrawal reaction means that humans and animals tend to move away from the source of the stimulus This response was called **Associative reflex** by Bekhterev
- He proposed that **consciousness is a form of physical energy**.

LESSON 13

CHARLES DARWIN

- Man can be studied the same way as we can study animals.
- Life and survival in the world requires constant struggle and battle against hostile forces This law is called "**Survival of the Fittest**"
- Environment plays a dominant role in determining the psychology of a person (**nurture**)

GUSTAV FECHNER

- Devising ways of measuring psychological experiences in physical terms, **called psycho-physics methods**

- Fechner proposed the concept of “Sensory Threshold”. According to Fechner, sensory threshold is the minimum stimulation required by a sense organ to register a stimulus. For example, at which level of volume, a human ear would be able to detect sound.
- “Absolute threshold” which is a stimulus value that evokes a response 50% of the times. This means that when a stimulus is given repeatedly for 100 times, it evokes a response 50 times, that is the absolute threshold.
- “Differential threshold” which is the stimulus value where one stimulus is regarded as different from another stimulus 50% of the time. This means that when two similar stimuli are given repeatedly 100 times, the difference is noted 50 times.
- method of measuring the absolute threshold; it is called the method of minimal changes.
- He has been called the father of psychophysics.

LESSON 13

Structuralists are philosophers/psychologists who defined psychology as the study of structure of consciousness.

WILHELM WUNDT

- Wilhelm Wundt is known for establishing the first psychology laboratory at Leipzig, Germany, in the year 1879.
- According to him, consciousness could be studied by three things:
 - **Experimentation:** (experiments revealed the true nature of consciousness)
 - **Introspection:** (he did not reject introspection as a method of gaining knowledge)
 - **Looking at the past history of man that has shaped his consciousness:** (Darwin was the first one to give rise to the nature versus nurture controversy. According to him.)
- He proposed that consciousness has three compartments:
 - Ideas
 - Feelings
 - Emotions
- The compartment of feelings can be divided as follows:
 - Pleasant/unpleasant
 - Relaxed/tense
 - Calm/excited
- Wundt also outlined the abnormal states of consciousness. He then went on to elaborate hallucinations, hypnotic states and dreams. According to him, all of these abnormal activities of the consciousness are caused due to the breakdown of attention.

EDWARD BRADFORD TITCHNER

- Three things that he tried to do

- Contents of consciousness
- Combination of these contents
- Connections between the contents
- Titchner argued that since the only way psychology could be studied was **introspection**

LESSON 13

Functionalists focused on, as the name implies, **the functioning of consciousness**

WILLIAM JAMES

- **Founder** of the sort of thinking called **functionalism** (Functionalist school)
- **Consciousness is not epiphenomena** means that consciousness cannot be considered as something whose functions or working cannot be explained.
- Consciousness creates adjustment between the organism and the environment
- Consciousness but all human psychological functions have a definite purpose. For example, fear in an animal creates movement in the body; laughter reduces tension etc.
- **Philosophy of pragmatism** which means that the **validity of an idea** is tested by its consequences. In other words, when we need to assay how valid an idea is we need to look at the consequences of the application of idea
- **James-Lange theory of emotions**. According to this theory, emotions are the consequences of perceptions of bodily changes. For example, a person feels angry because he strikes something.
- Repetition is most important for learning and repetition creates **habits**.

JOHN DEWEY

- Dewey put forward the view that education, particularly of children, should be based upon the needs of the children.

LESSON 16

DAVID KATZ

- David Katz was a European functionalists
- He gave the idea of **phenomenon of color constancy** (person perceive a color in the same way as before in different lights.)

EDGAR RUBIN

- Edgar Rubin who showed by his **experiments on perception**, that human beings see shapes in terms of **figure and ground**. When we listen to a song, the music being played is the ground and voice of the singer is the figure.

JEAN PIAGET

- Jean Piaget is famous for his **theory of how children's minds develop**. He postulated the concept of **Schemata** (thinking about how everything occurs)
- Schemata develop over the time by two processes:
- **Assimilation** absorption of new and different information about the world
- **Accommodation** expanding, stretching and changing of schemata to absorb new information about the world
- Another contribution of Jean Piaget is that he **elaborated how children develop**.
- **The sensory-motor stage** first stage of development when children learn using their sensations. For example a child touches a hot object and is hurt, this would create awareness in his or her mind that touching hot objects is harmful.
- **The pre-operational stage** second stage when the child for the first time, discovers rules and principles of how things work
- **The concrete operational stage** this third stage when his reason and logic develops and he learns by reasoning.
- **The formal operational stage** most developed and the last stage of development where the child is able to learn by abstraction

BEHAVIORIST

LESSON 17

Psychologists started analyzing, predicting and controlling human behavior since it was visible while consciousness was not. It gave birth to the school of thought now called the Behaviorist School

EDWARD LEE THORNDIKE

- He formulated "**laws of learning**". He said that learning takes place by stimulus-**response** connections rather than by association
- **Law of effect** (reinforcement)
- **Law of exercise** (repetition)
 - **Law of belongingness** (only relevant responses that "belong" to the learning situation are learnt. For example, the moving of paws by the cat in the puzzle box is learnt but not pricking of ears).
- Concept important to learning, "**Recency effect**". For example if a cat is rewarded for the last act which it performs in a series of acts, the last one shall be learnt by the cat.

LESSON 18

ALBERT WEISS

- Anything that cannot be studied with the methods of natural sciences should not be a part of psychology
- No mental forces apart from physiological forces which are reducible to physical forces. In other words, all mental forces can be studied using a physiological approach and not considering them to be extraordinary forces
- He said that every person's behavior is impacted by social forces

EDWIN HOLT

- He was of the view that psychology should concern itself only with directly observable facts and data

I. Behavior is the result of two factors:

a. Learning

Learning takes place when an organism is exposed to internal or external stimulation, e.g. **internal stimulation may be hunger, thirst** etc. while **external stimulation may be heat, coldness** etc. Organism behaves in response to these stimuli

b. Canalization

Further, behavior is also the result of canalization which is what we learn in our childhood. **Childhood experiences** influence and produce behavior and in any study of psychology we must not ignore those childhood experiences.

WALTER HUNTER

- Psychology should concern itself with observation of behavior of humans and should not concern itself with the problems of consciousness
- The environment and social circumstances have a profound impact on the behavior
- He is credited with the development of **temporal maze** for his experiments. Temporal maze was used to conduct experiments in which an animal was allowed to find its way around the maze to the food. When the animal had become familiar with the maze, it would take much less time to reach the food and thus Hunter drew his conclusions based on these observations. **He conducted experiments on delayed reaction time of animals for which he is known for**

LESSON 19

J.B.WATSON

- The founder of the school of behaviorism
- Watson taught that psychology should ignore consciousness and concentrate on concrete facts
- He was elected as the **President of American Psychological Association**.
- Use only **objective, experimental methods** and should not use introspection as a method
- Watsonian behaviorism, behavior can be studied in terms of **stimulus-response patterns**
- Watson said that a **"verbal report,"** may be obtained from the subject after the experiment
- **Thinking is nothing but "implicit behavior."** For example, when an individual manipulates images in his mind, thinking takes place. The individual relates these images together forming an explanation for the phenomenon that he is trying to study

- He said that the sensory activities of the brain can be classified as “molecular behavior.”
- By controlling the environment of an organism we could control and predict its behavior. This is known as environmentalism,

NEO-BEHAVIORIST

LESSON 20

Neo-behaviorists followed the Watsonian line of thinking although they were born after Watson.

CLARK HULL

- The first neo-behaviorist
- He gave a mathematical equation which explained his view point. The equation is as follows:

$$SER = D \times V \times K \times SHR$$

Where:

SER, is behavior

D, is drive, our need within a person

V, is Valence or stimulus intensity which your senses can register

K, is incentive, motivation target

SHR is habit

EDWARD TOLMAN

- He said behavior has a “purpose.” That is why he is also called a “purposive behaviourist.”
- He defined behaviour in a precise equation that is:

$$B = f(S, A)$$

Where:

B is behaviour

f is the function of

S is situation variables (a part of the environment that affects a subject's behavior in a way, e.g. the hot or cold weather)

A is antecedent variables (that is a part of the subject such as age, gender etc. and it impacts its behavior).

This means that behaviour is a function of situational variables and antecedent variables.

EDWIN GUTHIERE

- He put forward the view that behavior can be predicted and controlled by the “law of recency,” given by Thorndike, which states that “the last act is most likely to be repeated.”
- Guthrie developed a theory of neurosis in his book “The Psychology of Human Conflict” and because of this he may be regarded as one of the first behaviorist psychotherapists. He explained neurosis to be caused due to conflict of responses

LESSON 21

B.F SKINNER

- His main research work is now known by the title of **Instrumental or Operant Conditioning**
- He distinguished between **positive reinforcement**(reward) and **negative reinforcement**(punishment)
- **four schedules of reinforcement:**
 - a. **Fixed ratio schedule** (after fixed number of responses)
 - b. **Variable ratio schedule** (after variable number of responses)
 - c. **Fixed interval schedule** (after fixed time period)
 - d. **Variable interval schedule** (after variable time period)
- His famous book was: **"Beyond Freedom and Dignity"**

HARVEY HARLOW

- If a subject is curious about certain phenomenon, it would have a different learning pattern as compared to other subjects. Further, exploration and manipulation also affect learning.

HOBART MOWRER

- Hobart Mowrer at the University of Illinois showed that **factors such as hope and disappointment influence learning.**

DONALD HEBB

- Donald Hebb was a Canadian psychologist, who showed that, **when a part of the human brain was removed accidentally, it did not affect a person's IQ.**

KARL LASHLEY

- **He was a pupil of Watson**
- , he proposed that psychology is a science of behavior and behavior is the result of activity of the cerebral cortex, a part of the brain. which lead to the development of two principles given by Lashley himself.
 - i. **Principle of equi-potentiality:**

According to Lashley, one part of the cortex is the same as another part. Therefore, even if one part is cut off, the brain activity still takes place. In other words, both parts of the cortex have equal potential to make the brain work properly.
 - ii. **Principle of mass action:**

He also proposed that the more the cortex in mass, the better the learning and called it the "principle of mass action." So Lashley showed that behaviour and more precisely learning is a function of the activity of the cortex.

LESSON 22

Gestalt psychology adopted both the behaviorist's views and the structuralists' views.

Gestalt is a German word meaning patterns

MAX WERTHEIMER

- Wertheimer's discovery of the **phi-phenomenon**, apparent movement (concerning the illusion of motion) gave rise to the influential school of Gestalt psychology. Human mind has the tendency to develop something to fill into the gap.
 - He wrote a book named **Productive Thinking**
 - **Factors of organization that help us to perceive** in patterns or Gestalts
 - ✓ Closure (filling gap)
 - ✓ Similarity (grouping same looking things)
 - ✓ Proximity (group closely placed thing)
 - **Factors that influence perception.**
 - ✓ Habits
 - ✓ Familiarity
 - Wertheimer also tried to discover what is **creative thinking or problem solving thinking**
 - ✓ we are able to concentrate on discovering new rather than analyzing new from the already existing point of views. That is how we can become productive, creative thinkers
-

LESSON 23

WOLFGANG KOHLER

- Köhler is best known for **his experiments with problem-solving in apes at Tenerife** and the influence of his writings in the founding of the school of Gestalt psychology
- His writings include **Gestalt Psychology** and **The Mentality of Apes**
- Kohler's main contribution in the Gestalt School is his discovery of learning by insight. He conducted experiments on monkey and saw **that monkeys were able to solve their problems through insight**, Kohler concluded trial and error as a method of learning.
- Kohler also postulated the **concept of isomorphism**, the map is the individual's perception about the world around him

KURT KOFFKA

- His book **Growth of the Mind** (1924) was considered responsible for awakening much interest in Gestalt concepts.
- He **distinguished between the geographical field and the field of experience** In his views, an individual tends to ignore the geographical field in face of the field of experience which dominates his understanding or perceptions

Productive or Problem Solving Thinking:

MIHÁLY CSÍKSZENTMIHÁLYI

- He is noted for his work in the study of happiness, creativity, subjective well-being, and fun, but is best known as the architect of the notion of flow and for his years of research and writing on the topic
- American Psychological Association, described Csikszentmihalyi as the world's leading researcher on positive psychology

EDWARD DE BONO

- He developed his theory of Lateral Thinking which is akin to creative or problem solving thinking
- He developed some exercises to inculcate lateral thinking. Some of his exercises are, —question —rotate, discover —dominant ideal etc

LESSON 24

Kurt Lewin

- Kurt Lewin gave a theory which he called the Field Theory. The individual has many attractions which may be positive or negative, because of these positive and negative opportunities, conflicts arise in the mind of individuals who have the chance to avail either of the two opportunities. He proposed three kinds of conflicts that a person may be faced with:
 - The approach-approach conflict (challenge of choosing between two liking things)
 - Approach-avoidance conflict (choose a thing with its good and bad qualities)
 - Avoidance-avoidance conflict (choose between two unlikely things)
- The other important contribution is his theory of leadership
 - Authoritarian (to control everything)
 - Democratic (considering the thoughts of others in making decision)
 - Laissez-faire (giving power to others and lead from back seat)

DYNAMIC PSYCHOLOGY

Dynamic Psychology is also called Hormic Psychology.

WILLIAM MCDUGALL

- According to McDougall, behavior is the result of
 - ✓ internal striving
 - ✓ an urge to live

✓ hormone.

- This —hormone or the urge to live expresses itself in various forms and kinds of behavior. In other words, all organisms try to survive against the environment **his point of view is called the —hormic view point**

LESSON 25 & 26

Historic-Evolutionary Psychology tried to see how consciousness in humans developed, what exact role it played in different historical stages of man's development and how it impacts behavior. In other words, these psychologists looked at the historical evolution of consciousness. They focused on how, in the past, man has been able to develop his power to think and understand and what role has his consciousness played in this regard

The Soviet revolution had taken place in 1917

LEON VYGOTSKY

- He showed **that environment effects man, but then in turn man also effects** the environment
- Leon proposed that the higher mental function of consciousness also developed through the process of evolution
- He emphasized on the fact that the structure and the functions of the consciousness cannot be separated.
- Consciousness functions separates man from animals

SERGEI RUBENSTEIN

- Rubenstein rightly pointed out **the importance of internal conditions** apart from the external stimulus and response relationships
- Rubenstein also showed that external factors affect psyche and then in turn psyche also affects external factors in the environment
- He argued that consciousness originates as a result of sensitivity to certain stimuli

ALEXEI LEONTIEV

- When the body receives stimuli from the environment, it reacts to them
- Leontiev classified these stimuli into two categories.
 - a) Ordinary stimuli
 - b) Symbolic stimuli
- Leontiev also showed by pointing toward various stages of man's development that man learnt by conditioning according to a set pattern. The order of learning is as follows:
 - Man first learnt lower order things and functions(eating drinking)
 - later the higher functions (thinking)

K.M BYKOV

- Bykov points out the development of verbal communication and man's ability to respond to verbal stimulus
- . This means that when we hear a bad news, we respond to it accordingly

LESSON 27 & 28

In 1790 laws were made that separation of patients suffering from nervous diseases is required, from those suffering from other diseases

PHILIPPE PINEL

- He is regarded as father of modern psychiatry by many psychologist
- Pinel is regarded as the pioneer in helping society recognize the fact that mental symptoms are a kind of disease, and people suffering from such disorders should be treated as sick and not considered to be possessed by evil spirits, demons or the devil.

SAMEUL TUKE

- British physician
- He also freed mental patients from their chains and started to treat them as sick rather than possessed by spirits, demons or the devil.

FRANZ MESMER

- During the same time mental diseases or insanity was being treated by a method called Mesmerism. His interest in "animal magnetism" developed into a system of treatment through hypnotism that was called mesmerism
- According to Mesmer, people have a force that he called "animal magnetism," and when the balance of animal magnetism gets upset in the body, people get mad or insane.

JAMES BRAID

- In this book he coined the words hypnotism, hypnotize, and hypnotist, which remain in use. Braid thought of hypnotism as producing a "nervous sleep" which differed from ordinary sleep. The most efficient way to produce it was through visual fixation on a small bright object held eighteen inches above and in front of the eyes

JEAN CHARCOT

- Jean Charcot was a French neurologist
- He wrote an article in one of the prestigious medical journal showing that hypnotism can be used to treat hysteria

BERNHEIM

- He showed that hypnotism cannot treat **hysteria** only but also **other mental diseases**

LESSON 29 & 30

SIGMUND FREUD

- .. He is the inventor of psycho-analysis as a method of treatment
- He gave the parts of mind as follows:
 1. ID
 2. EGO
 3. Super EGO [ego ideal , conscience]
- He developed the theory of **psycho-pathology** of everyday life. Slips of tongue, slips of memory etc. are representative of psychopathology of everyday life. He developed the theory of interpretation of dreams
- He gave defense mechanism
 1. **Repression:** forgetting painful events.
 2. **Regression:** acting like a baby
 3. **Displacement:** showing someone's anger to others
 4. **Rationalization:** socially acceptable explanation
 5. **Denial:** refusing
 6. **Projection:** attributing to others
 7. **Sublimation:** hating someone behaving nicely
- Freud also developed a **theory of neurosis**. According to his theory:

Neurosis= Predisposition + trauma

- he formulated his method of **treatment of mental disorders which is called psychoanalysis**. The procedure of psychoanalysis includes:
 - Free association
 - Interpretation of dreams
 - Interpretation of psychopathology of everyday life
 - Analysis of resistance
 - Analysis of transference

ANNA FREUD

- .. She was the sixth and last child of Sigmund
- Her field of specialization was **Child Psychology**. Her main contribution in this field was the Identification with aggressor among the children who dominates the rest of the children.

HEINZ HARTMANN

- His work marked the development of the theoretical movement known as Ego-psychology

ERNST KRIS

- . According to him Ego controls regression.

LESSON 31 & 32

CARL GUSTAV JUNG

- Introduced analytical psychology
- According to him unconscious has different layers.
 1. The upper layer is the personal unconscious. It has repressed materials
 2. And the deeper layer is the collective unconscious. It has experiences of forefathers and generations in the form of archetypes.
- Some archetypes given by Jung are:
 1. Persona (different role plays different masks)
 2. Anima (qualities of woman in man)
 3. Animus (qualities of man in woman)
 4. Shadow
 - Constructive shadow (showing hidden postiveness)
 - Destructive shadow (showing to be polite but rude)
- He stated that personality has two types:
 1. Introvert finds it within.
 2. Extrovert " in the surrounding world
- He also theorized that personality has four functions:
 1. Sensory function (rational part of the personality, where logic plays the dominant part.)
 2. Thinking function
 3. Emoting function (refers to the emotional part of the consciousness)
 4. Intuiting function (refers to the ability to foresee things.)
- There are eight personality types, depending upon introversion or extroversion and the four functions of each type namely:
 - a. Introverted Sensory
 - a. Introverted Thinking
 - b. Introverted Emoting
 - c. Introverted Intuiting
 - d. Extroverted Sensory
 - e. Extroverted Thinking
 - f. Extroverted Emoting
 - g. Extroverted Intuiting

- He elaborates theory of dreams. Dreams interpretation should be based upon a series of dreams rather than a single dream
- In Jung's view, dreams show wishes, desires, and conflicts and even give warning about future.
- Anticipatory dreams (future events) or Prophetic dreams
- In order to interpret a dream, Jung used the process of amplification and symbolism
- He rejected free association and adopted dialogue, discussion and full confession.
- The steps involved in Jungian therapy are:
 - a. Reading (for some)
 - b. Collaboration with the therapist
 - c. Focusing on the situation at present
 - d. Making any insight concrete and finding a way to put it into practice

LESSON 33

ALFRED ADLER

- Individual psychology refers to the idea that we should see people as wholes rather than parts. The word individual means literally "un-divided." Second, instead of talking about a person's personality, with the traditional sense of internal traits, structures, dynamics, conflicts, and so on, Adler preferred to talk about lifestyle
- Alfred Adler postulates a single "drive" or motivating force behind all our behavior and experience. He called that motivating force —striving for perfection
- Further, according to Adler the concept of —organic inferiority. He thought that because of organic inferiority a person develops —striving for superiority.
- This striving for superiority leads to:
 - ✓ Compensation
 - ✓ Over compensation
- One way to compensate inferiority feelings or complex is to become aggressive. The person develops a drive to aggression but also has social interest
- The Adlerian therapy consists of:
 - ✓ A good human relationship between patient and doctor
 - ✓ Direct conversation
 - ✓ Dream interpretation
 - ✓ Analysis of childhood memories
 - ✓ Likes and dislikes of heroes
 - ✓ Body of languages sitting, walking, talking etc.

LESSON 29 & 30

HARRY STACK SULLIVAN

- He put forward the view that a baby feels **euphoria** because his mother feeds and protects him, The mother may convey insecurity in him if she is tense herself. So a person's psyche is the result of interpersonal relationships
- Sullivan says that because of interpersonal relationships, the concept of self develops. He defined three types of self: %
 - a) **"Good me"** % The good me is everything we like about ourselves. It represents the part of us we share with others
 - b) **"Bad me"** % The bad me represents those aspects of the self that are considered negative and are therefore hidden
 - c) **"Not me"** represents all those things that are so anxiety provoking that we can not even consider them a part of us. Pushing it deep into the unconscious.
- He put forward the view that because of our interpersonal relationships we come to have three types of experiences: %
 - a) **Prototaxic** experience % (experience the infant has and the order or arrangement in which it occurs. Unorganized not clear)
 - b) **Parataxic** experience % (things learned through signs symbols like language)
 - c) **Syntaxic** experience (developed experience in which free communication takes place)
- Sullivan stated that there are about seven stages of human development:
 1. **Infancy From 0-1,**
 2. **The childhood period 2-6 years**
 3. **The juvenile era 7-8**
 4. **Pre-adolescence; 8 to 12 years**
 5. **Early adolescence** This is from 13 to 18.
 6. **Adolescence**
 7. **Maturity**
- Sullivan's therapy mainly related to schizophrenia and he discovered that interview was an important tool of psychotherapy. He used empathy as another tool of psychotherapy.

KAREN HORNEY

- He put forward the view that parental roles can produce **basic anxiety** in a child and that is one of the main driving forces in a person. The child sees the world as hostile, and he feels helpless.
- His reactions to anxiety and aggression may take the form of:
 1. Disguised hostility (unfriendly)
 2. Temper tantrums (rolling down screaming)
 3. Withdrawal (isolated)
- Karen Horney offered a list of **ten neurotic needs** which are:

- I. Need for approval
- II. Need for domination
- III. Confine life
- IV. Independence
- V. Perfection
- VI. Power
- VII. Exploiting others
- VIII. Prestige
- IX. Ambition
- X. Admiration
- These needs lead to neurotic trends

a) Movement towards

These people have an intense need to be liked, involved, to be important, and appreciated. Their Attempts to make other person love them create a clinginess and neediness and it often results in the other person leaving the relationship.

b) Movement away

This protects them from emotional pain of relationships, it also keeps away all positive aspects of relationships. It leaves them feeling alone and empty.

c) Movement against

Those with this personality style come across as bossy, demanding, selfish, and even cruel.

- Horney distinguishes between situational neurosis(temporary mental disease) and character neurosis(permanent disorder). Her method of treatment was to discover the neurotic needs, the movement away, movement towards, and movement against plus bring it to the attention of the person.

ERICH FROMM

- In his famous book “Escape from Freedom” written in 1941 he proclaimed his break from Freud and classical psychoanalysis.
- . Fromm said that this need for freedom and dependence creates orientations
- 1. **Receptive orientation** man tends to accept what is being enforced upon him.
- 2. **Exploitative orientation** means to be aggressive and using others for own purposes
- 3. **Hoarding orientation** distrust for others
- 4. **Marketing orientation** the person behaves in a manner which is liked by others.
- 5. **Productive Orientation** Productive orientation is the healthy way of life. This is the way of life where the individual realizes his full potential.

LESSON 36

J.L. MORENO

- He is the founder of Psychodrama, Sociometry and one of the pioneers of Group Psychotherapy.

- He was of the view that mental disease was due to **lack of spontaneity**. And that the mental disease was a reflection of man's social and familial relationships. He thought it could be relieved/cured by increasing spontaneity in a person and by providing a person an opportunity where he could relive his familial and social situation. Moreno developed the technique of "**Psychodrama**" to achieve those two purposes. Psychodrama consists of:
 - a) **Stage** It is the setup in which the analysis is performed.
 - b) **A director** The psychiatrist acts as the director who conducts the drama.
 - c) **Protagonist** is the central character around which the drama revolves.
 - d) **Audience** is the people who witness the drama.
 - e) **Role playing** refers to the performance of various acts in the drama.
 - f) **Role reversal** refers to the exchange of roles between characters of the play. Each character plays the role of another so that he may get familiar with the intricacies of the other role.
- Creativity increases spontaneity leading to mental health. **Moreno also developed a number of techniques to measure group phenomena. This he called "Sociometry."** Group phenomenon or sociometry refers to the behavior of individual in group situations and overall behavior of the group.

ERIK ERIKSON

- He was influenced by Freud's description of psycho-sexual development but he thought that the **development of a person should be viewed as psychosocial development** rather than psycho-sexual development
 - A. Basic Trust vs. Mistrust (Oral-Sensory Stage): Birth –18months: Infancy
 - B. Autonomy vs. Shame and Doubt: 18 months to 3 years: Early Childhood
 - C. Initiative vs. Guilt: 3 to 6 years: late Childhood
 - D. Industry vs. Inferiority: 6 to 11 years: School Age
 - E. Identity vs. Role confusion: Adolescence
 - F. Intimacy vs. Isolation: 18 to 25 years: Young adulthood (beginning in the early 20s and may extend to the 40s)
 - G. Generativity vs. Stagnation: Middle adulthood (40-60 years)
 - H. Ego Integrity vs. despair: Old age

LESSON 37

Humanistic psychology is a branch of psychology that developed from behaviorism. Humanistic psychologists thought that the behaviorists ignored the humanistic view of people, their needs, aspirations, hopes, fears, and focused only on behavior

ABRAHAM MASLOW

- Maslow's primary contribution to psychology is his Hierarchy of Human Needs
 - a) Physiological needs
 - b) Safety needs
 - c) Need for belongingness
 - d) Esteem Needs
 - e) Need for Self Actualization

CARL ROGERS

- In 1961 in his book entitled “On Becoming a Person” he regarded self-actualization as the greatest drive in human personality
- According to Carl Rogers, a psychologically healthy person:
 - a) Has openness to experience
 - b) Fully lives the moment
 - c) Has a sense of freedom
 - d) And is highly creative
- Based upon his humanistic theory and point of view he developed his system of psychotherapy called Theory of Client Centered Therapy based on reflection.

Positive psychology

Positive psychology is the scientific study of human happiness. William James. In his 1902 book, The Varieties of Religious Experience, James argues that happiness is a chief concern of human life and those who pursue it should be regarded as "healthy-minded."

LESSON 40

D.L. ROSENHAN

- He conducted an experiment three women and five men who were perfectly normal and most of them were well educated, entered in 12 mental institutions of different places in U.S.A. They posed as mental patients saying that they hear voices, but apart from this, offered completely correct information about themselves. These “patients” remained in hospitals for 19 days on the average
- It is impossible to distinguish between normal people and patients according to the rules and procedures of mental hospitals.
- Mental hospitals leave extremely negative effects on inmates.
- Mental hospitals treat patients without pity and with cruelty.

- That the overall environment of mental hospitals needs great improvement. Further, research showed in this context that up to 80% patients released from mental hospitals went back and are re-admitted.

R.D. LAING

- His book “The Divided Self” appeared in 1959 and is considered to represent the basic view of antipsychiatry movement.
- Laing used the existential philosophy to understand and explain the concept of mental illness, thereby trying to look at schizophrenia from the patient’s point of view.
- He was against labeling mental diseases, because he thought that from the patient’s view, he is not suffering from a disease. In his opinion labeling was used to control people. In other words, in his own view no patient was sick
- In his view the cause of mental disease was division in the self and the therapy suggested by Laing is known as “Metanoia.” Metanoia means a change in the mind.
- This could be achieved in various ways such as arts, discussions, seminars, etc. He established a place called Kingsley Hall where activities such as seminars, discussions, dance, yoga, painting, stitching were carried out to create and achieve metanoia.

AARON ESTERSON

- Esterson focused on family therapy and showed that the family picks up a person and then labels that person “mad.” This is called scapegoating
- His method of treatment was to expose the mechanisms of scapegoating to the patient and make the patient realize that he or she was not sick but was just being called sick. In that way the patient would be able to deal with any future labeling upon him
