Team Zoology LEGENDS

Zoology Legends

- Butterfly and **moth** are examples of cocoon building insects.
- **Spinnerets** allow spiders to decide the type of silk for spiderweb.
- Sparrow makes its nest from___

a. Twigs b. Wires c. **Grass** d. stem

- Belly of stikleback fish is **red** in color.
- There are **2 types** of orientation movements.
- ***Ethology*** is scientific study of animal behavior in natural environment.
- Classical and Operant conditioning are examples of **associative learning.**
- **Habituation**: A loss of responsiveness to stimuli that convey little or no new information
- **Testosterone** is critical for male sexual behavior.
- There are **two types** of animal behavior.
- There are **two methods** to determine effect of genes on behavior.
- Ultimate cause is:

Isky jo teen maqasid thy na pptz main whe thy options aur correct option all of these

Zoology Legends

● Behavior is sum of two systems nervous and **endocrine**.

● Crayfish uses **tailflip** behavior for escape.

● Neuronal plasticity is capacity of **nervous system** to change with Experience.

- Birds make nests with **Grass.**
- **Circadian** rhythm regulates and coordinates daily behavioral activities.
- **Migration** a regular, long-distance change in location relative to the **earth magnetic field.**
- **Competition** is the struggle among organisms to survive in a habitat with limited resources.
- **Foraging** is the activities of an animal related to search, recognize and capture food items.
- **Generalist** species that can live in many different types of environments, and have a varied diet.
- **Monogamous system** in which one male mates with one female during a breeding season.
- Monkeys troop always has a dominant male (**alpha male**).
- A **society** is a group of individuals belonging to the same species and organized in cooperative manner.

Zoology Legends

- Majority of ants form underground nests called **formic aria.**
- Which is not a social insect (**butterflies**)
- Social organization in chicken called the **pecking order**.
- **90%** of bird species are socially monogamous
- In Black Tailed Prairie dog social units are called **Coteris**.
- A **territory** is an area defended against other members of the same species.
- **Territory** provides food, water supplies, nesting areas and refuges from danger.
- **Social behavior** is a set of interactions among individuals of the same species.
- An **aggregation** is any form of gathering of animals or the process of coming together.
- **Vampire bats** regurgitate blood and donate it to other members of their group who have failed to feed that night, ensuring they do not starve.
- **Game theory** explains how reciprocal altruism dominates over cheating behavior.
- **Birds** show maximum parental care.
- Bi-parental care is the most common form in **birds**, especially in passerines.

Zoology Legends

- Culture enhances the **fitness** of individuals much rapidly.
- Genes perpetuate by **natural selection**.
- **William Hamilton** proposed the idea of kin selection.
- One obvious benefit for **social aggregations** is defense, both passive and active, from predators.
- Human culture is related to **Darwinian evolutionary theory**
- Social ranks do not change in **honeybees**.
- Threshold stimulus in terms of **Fixed Action Pattern**
- **Taxis:** "An oriented movement toward (positive taxis) or away (negative taxis) from some stimulus"
- **Ortho kinesis**: It is a response that involves changes in the speed of movement of the whole body in response to stimuli like humidity, preserve and diffused light.
- Trial and error learning is also called **operant conditioning**.
- **Nervous system** help in shaping behavior.
- Russian physiologist Ivan Pavlov experimented on..... **Classical conditioning**
- Black Tailed Prairie dog Highly social, although social units are called **Coteries**.
- White handed gibbons are **monogamous Species.**

- There is also a social organization in chicken Called the **pecking order.**
- Reciprocal Altruism found in **Cleaner fish**
- Social ranks do not change in **bees**
- The troop always has a Dominant **male (alpha male**).
- **Circadian** rhythm regulates and Coordinates daily.
- Butterflies and **moths** are the most common cocoon building insects.
- The length of the period of a biological rhythm in the absence of environmental cue is called **free run.**
- **Competition** is the struggle among organisms to survive in a habitat with limited resources.
- **Optimal Energy Expenditure model** analyzes the energy needed to search food, energy needed to pursue and handle food and energy required to digest the food.
- Species that can live in many different types of environments, and have a varied diet are considered **generalists**.
- In **monogamous** relationship, one male mates with one female during a breeding season.
- Cleaner fish is example of **Reciprocal Altruism**.
- Natural selection that acts to maximize the **fitness** of group of individuals in the population.

- **Kin selection** is an altruistic evolutionary strategy that favors the reproductive success of an organism's close relatives
- Some birds are **polygamous** are active and social animals
- **Sterile females** repair nest ,collect and store food.
- Classical conditioning and Operant conditioning are example of **Associative Learning**
