Regards: Be Kind To Yourself (S.Malik)

Psy511 paper #1

Q.1 What is urbanization Particularly focus on female migrant?

According to the report on Pakistan, the proportion of females is lowest in rural-to-urban migration and highest in rural-to-rural migration. The same pattern has been observed in India. In the rural urban stream, the share of females is 51 percent in Pakistan. A relatively large fraction of rural urban migrants' cross provincial boundaries. The perception that "the urban migrant is invariably a male" is incorrect; females make up a considerable proportion of migrants.

Q.2 How energy consumption techniques can be used in construction and building? 5

The construction of homes is a critical factor in determining energy consumption. Key considerations include wise use of insulation, effective shading in summer, and utilization of sunlight in winter. Implementing these strategies can result in substantial energy savings without compromising comfort. For instance, well-insulated homes with

strategic shading can retain heat during winter and keep interiors cool during summer, leading to reduced energy needs for heating and cooling.

Commercial buildings often exhibit excessive energy consumption due to design choices such as extensive glass usage and tall structures. For example, buildings like the Sears Tower in Chicago consume more electricity than entire towns. Implementing energy-efficient design principles and modifying appliance usage can lead to significant energy savings in commercial buildings.

Q.3 Enlist eco-friendly contributions

Visualize a future where energy conservation and efficiency are ingrained in everyday life, leading to sustainable and eco-friendly practices across all sectors. Behavioral Solutions to Environmental Problems

- **Tragedy of Commons:** The concept of the tragedy of the commons highlights the conflict between immediate self-interest and future public interest. It underscores the need for collective action and responsible environmental stewardship.
- **Education to Preserve Environment:** Educational initiatives play a crucial role in promoting environmental preservation. However, simply telling people what to do may not be effective. Instead, efforts should focus on changing attitudes and behaviors gradually.

Analysis and Intervention: Applying principles of behavior modification can lead to

positive changes in environmentally relevant behaviors. Strategies include:

O Baseline Period: Observing naturally occurring behaviors related to energy use.

o Treatment Period: Introducing interventions like rewards for desired behaviors and punishments for non-target behaviors.

o Follow-Up Period: Continuing observations post-intervention to assess effectiveness.

Q.4 What is the reason that moves people to confirm with the group?

Conformity means a tendency to shift one's opinions or actions to correspond with those of other people because of implicit or explicit social pressures. Conformity is a phenomenon here. Conformity is pervasive in society, influencing career choices, among other things. For instance, in our country, many gravitate towards careers like medicine or engineering, following societal norms. One of the great reasons is often involves people outwardly agreeing with the group while inwardly retaining personal opinions. This internal conflict can be stressful, leading individuals to eventually adopt the group's viewpoint to reduce discomfort—a process known as internalization.

Q.5 Hans selye 3 stages of stress appraisal?

Psychologist Hans Selye introduced the concept of adaptation syndrome, proposing that stress unfolds in three distinct stages:

1. Alarm Reaction

2. Stage of Resistance

3. Stage of Exhaustion

Q.6 Define urban sprawl and why it is important to study?

Urban sprawl refers to the expansion of low-density residential areas, shopping centers, and industrial facilities connected by multilane highways, leading to unplanned development and environmental challenges. While sprawl offers benefits like larger homes and better services, it also increases vehicle ownership, fatal accidents, and health issues like obesity and high blood pressure. In conclusion, understanding the complexities of urban sprawl is crucial for creating sustainable cities that balance personal preferences with environmental conservation for the common good.

Q.7 Stress act as stimulus or response?

Noisy environments, for example, may be related to physiological, psychological, and behavioral changes in those exposed to the noise. These responses, in turn, may change the nature and interpretation of the noise itself (i.e., noise changes neural activity in the reticular activating system, which subsequently changes the organism's perception of the noise; this altered perception, in turn, influences reticular activating system activity, and so on). Stress, therefore, is neither the stimulus nor the response; it is a process involving both, and, as a process, it influences the ways in which environmental events are attended to, interpreted, responded to, and changed. It is also

the process within which the responder also is likely to be changed.

Q.8 What is purpose of prison? 5

In the realm of correctional facilities, there exists a complex interplay of conflicting goals and varied philosophies regarding the purpose and design of prisons. This handout delves into the intricacies of imprisonment, exploring different models, architectural ideologies, and their impact on inmates' experience. Prisons face conflicting goals, resulting in disparities in sentencing and rehabilitation opportunities.

Diverse Perspectives: Various stakeholders, including corrections employees, judges, legislators, and inmates, hold conflicting ideas about the goals of prisons.

Sentencing Disparity: This diversity of perspectives leads to significant differences in sentencing, parole criteria, and rehabilitation opportunities.

Prison design is not merely about physical structures but also about embodying philosophical ideals and fostering environments conducive to rehabilitation and integration. Understanding these complexities is essential for informed discussions in environmental psychology and criminal justice studies.

Psy511 Paper#2

Q.1 Definition of crowding according to different researcher.

Crowding occurs when more people share a small area, making individuals uncomfortable and feeling their privacy is compromised. For example, someone from a rural area moving to a city may find apartment living too close for comfort.

Zlutnick and Altman (1972) have defined crowding in terms of an individual's inability to adequately control interactions with others; Van Staden (1984) emphasized perception of large numbers of people, spatial restriction, and an aversive experience of the situation as relevant components of the crowding construct. In this regard crowding may be thought of as a psychological concept referring to a subjective experience, which may or may not be adequately reflected by population density measures such as the amount of physical space per person or number of people per unit of living space.

Q.2 Explain Calhoun crowding and effects? 5

Controlled experiments, such as those conducted by Calhoun (1962) with Norway rats, provide further insights into the consequences of overcrowding. In this study, Calhoun provided Norway rats with an environment characterized by abundant resources, including unrestricted access to food, water, and nesting materials. Notably, the only limiting factor imposed was space, as the physical environment remained constant throughout the study. Over time, the rat populations expanded, leading to a

phenomenon where dominant individuals claimed more spacious territories, while others were confined to increasingly crowded areas within the confined space. This confined area was termed a "behavioral sink" by Calhoun.

Q.3 Asian people are more tolerant explain their life span?

Gillis, Richard, and Hagan (1986) noted that Asians tended to be more tolerant of high-density living, while British individuals were less adaptable, and Southern Europeans fell somewhere in between these extremes. Gillis, Richard, and Hagan's (1986) study highlighted these differences, with Asians showing greater adaptability to high-density living compared to their British counterparts. This suggests that cultural factors play a significant role in shaping individuals' perceptions and responses to living density, influencing their overall well-being in residential environments.

Q.4 Stressor and types

Stressors can vary in duration and intensity. Daily hassles, cataclysmic events, major life changes, and ambient stressors all contribute to the overall stress experience for everyone.

Types:

Chronic Stressors

Acute Stressors

Psy511 Final term subjective July 2024

Regards: Be Kind To Yourself (S.Malik)

Controllable stressors

Uncontrollable stressors

Ambient Stressors

Q.5 Definition reinforcement and type

Increasing the frequency of desired behaviors.

Types:

Positive Reinforcement: Offering pleasant consequences for desired behaviors.

Negative Reinforcement: Removing negative consequences for desired behaviors.

Psy511 Paper#3

Q.1 Types of appraisal

Harm or loss assessment: Evaluating damage.

Threat appraisal: Recognizing future dangers.

Challenge appraisal: Focusing on overcoming stressors.

Q.2 Slums Surrounding the Cities

Vast slums surrounding the cities are a great challenge to the institutional structure of developing countries. Because slums are unauthorized areas, cities rarely provide them with electricity, water, sanitation, and other social amenities. Yet the slums often represent essential workforce to the city taking low-paying jobs that keep the city and its inhabitants functioning. People live in the fear of bulldozers coming in any time and leveling down the shanty town. A great need in such neighborhood is home security. People in the slums also need more jobs. Greatest need for people living in these areas is government representation. Their voices are seldom heard because they are among the poorest and most powerless in society.

Q.3 Crowding

Crowding occurs when more people share a small area, making individuals uncomfortable and feeling their privacy is compromised. For example, someone from a rural area moving to a city may find apartment living too close for comfort.

Q.4 Queuing theory

Queuing theory, focusing on waiting dynamics, is vital for efficient design in various contexts, from retail settings to transportation systems. Understanding traffic intensity and optimizing service processes can significantly enhance user experiences.

- **Queue and Traffic Intensity:** Explaining the concept of queue and traffic intensity in service environments.

Q.5 Components of Hardy personality

The key components of a hardy personality include:

A strong sense of commitment

A perception of challenges as opportunities for growth

A belief in one's ability to exert control over their life.

Q.6 Human Behavior across situation

Human behavior across situations is unpredictable in terms of personal factors alone. Walter Mischel's contention revolves around the interaction between individuals and their environments. He suggested that behavior is not solely a result of internal traits but is significantly influenced by the external situation and context. Mischel argued that an individual's behavior is better predicted by understanding the specific circumstances they are in, rather than relying on broad trait-based predictions. Mischel's view challenges traditional trait theories that suggest personality traits are consistent across different situations. Instead, he posited that there is a dynamic interplay between the person and the situation, where the environment can shape behavior just as much as an individual's personality traits can.

Q.7 Challenges faced by Prisoners

World War II prisoners experienced severe stress due to their lack of control. Improving

physical fitness also enhances resilience to stress. Discussing stress emphasizes building resilience, not vulnerability. Sommer's research in 1972 highlighted that factors such as crowding, lack of privacy, and sensory deprivation contribute significantly to the challenges of confinement and restriction faced by prisoners.

- Luxenberg's analysis in 1977 indicated that modern prisons have made efforts to mitigate the negative effects of designing solely for maximum security, achieving varying levels of success in this endeavor.
- Paul Paulus and colleagues found that inmates in single or double occupancy cells perceive less crowding compared to those in cells with larger numbers. Consequently, prisoners in denser cells report more health issues and more time in the infirmary.

Q.8 Urban Slums

In the developed world the other end of ex-urban migration is the city from which people are moving. A completely different set of factors is responsible for urban blight in developing countries. In this case, people are moving to the cities at a rate that far exceeds the capacity of cities to assimilate them. The result is urban slums that surround virtually every city in the poorer developing countries.

City housing is overwhelmed by the influx of migrants who could not afford the rents even if housing was available this leads to the formation of slums. Vast slums surrounding the cities are a great challenge to the institutional structure of developing

countries Because slums are unauthorized areas, cities rarely provide them with electricity, water, sanitation, and other social amenities

Psy511 paper#4

Q.1 Wohlwill's Adaptation Level Theory

Adaptation level theory means that human beings function best when their level of arousal is on an intermediate scale. This means that they are not too much aroused, that they are not too under-aroused. When we apply this theory to city life then we find out that there is a lot of population in the city. There are so many entertainment places.

Q.2 How population of Pakistan has changed to urbanization?

By 2030, Pakistan's urban population will equal its rural population. - Rural-to-urban migration is significant, with many females migrating. - One-third of city dwellers live in slums due to a lack of jobs and proper housing.

- Urbanization in Pakistan increased from 17.4% in 1951 to 35% in 2005, with major urban centers like Karachi, Lahore, and Peshawar experiencing rapid growth. This process is called "Urban Blight," with populations moving quickly from rural to urban areas.

Q.3 Primary and secondary appraisal

Primary Appraisal: The process of recognizing and assessing the significance of an environmental stressor.

Secondary Appraisal: The assessment of one's resources and options for coping with the stressor.

Q.4 Benefits and challenges of open classroom

1. **Flexibility:** Open classrooms allow for adaptable learning environments that can cater to different teaching styles and student needs.

2. **Collaboration:** Encourages students to work together, fostering teamwork and communication skills.

3. **Creativity:** Provides opportunities for creative teaching methods and learning activities.

4. **Resource Sharing:** Easier access to shared resources and materials among teachers and students.

Challenges:

1. **Noise:** Open spaces can be noisy, which might distract some students.

2. **Discipline:** Maintaining discipline can be harder in a less structured environment.

3. **Privacy:** Lack of private spaces for individual work or sensitive discussions.

4. **Cost:** Setting up and maintaining open classrooms can be more expensive than traditional setups.

Q.5 Personality traits

Personality traits are relatively stable over time.

- Personality traits are consistent over situations.

Personality traits are consistent across different situations. Instead, he posited that there is a dynamic interplay between the person and the situation, where the environment can shape behavior just as much as an individual's personality traits can.

Psy511 paper #5

Q.1 Enculturation and acculturation difference

1. **Enculturation:** Learning one's own culture.

Formal (from parents) and informal (through media).

2. **Acculturation:** Learning a new culture, which evolves over time.

Example: Technological advancements like the microwave have changed our cultural practices.

Q.2 Urban sprawl

Urban sprawl is the expansion of low-density residential areas, shopping centers, and industrial facilities connected by highways, leading to unplanned development and environmental issues. **Origins of Urban Sprawl:** Historically, cities were compact and designed for walking, biking, and public transport. With technological advancements and increased private transportation, cities expanded outward.

Q.3 Modern prison design

Luxenberg's analysis in 1977 indicated that modern prisons have made efforts to mitigate the negative effects of designing solely for maximum security, achieving varying levels of success in this endeavor.

Q.4 Model F: Event Proneness Hypothesis

Finally, Model F portrays stressful life events as exacerbating already existing health disorders. It is called the event proneness hypothesis because stressful life events are thought to characterize individuals who are already ill.

Q.5 Controllability of stressors

Few stressors can be controlled and there are few which cannot be controlled. For example, the temperature of the air conditioner can be controlled in your house but while traveling in a bus it cannot be controlled which causes flu or sore throat for some

people. So, stress can also be measured in the aspect of control as we can adjust the stressor according to our needs.

Q.6 Effects of high population density

Maintaining high population density preserving heterogeneity of residences, businesses, stores, and shops keeping layouts on human dimension so that people can meet, visit or conduct business incidentally over coffee at side walk café or stroll through an open area.

Psy511 paper# 6

Q.1 Open Space Classrooms

Exploring innovative classroom designs, open-space classrooms offer flexibility and increased interaction among students and teachers. However, studies also highlight challenges such as increased noise levels and visual distractions, emphasizing the need for careful design considerations.

Q.2 Model of stress

Stress is the state when environmental demands force changes. Theories differ on whether stress is the demand itself or the response.

Theoretical Models of Stress

Biomedical Model

Various models explain how stress induces adverse health effects:

- **Model A: Victimization hypothesis** suggests direct effects of stressful events on health.
- **Model B: Stress-strain hypothesis** posits that psycho physiological strain mediates health impacts.
- **Model C: Vulnerability hypothesis** explores preexisting dispositions moderating stress - health relations.
- **Model D: Added burden hypothesis** proposes independent contributions of personality and social conditions to illness.
- **Model E: Chronic burden hypothesis** suggests stable personal characteristics and social conditions cause health changes.
- **Model F: Event proneness hypothesis** sees stressful events exacerbating existing health disorders.

Q.3 Anti-social behavior

Anti-social behavior is the exact opposite of pro-social behavior. Pro-social means that you are pro-people. You are towards the people. You affiliate with them. You connect with them. You relate to them.

Q.4 Relationship crime

"Relationship crime" typically refers to criminal activities that involve individuals who are in a relationship with each other, such as spouses, partners, or family members. These crimes can include domestic violence, stalking, harassment, and even more serious offenses like homicide or financial exploitation within a relationship context. The dynamics of such crimes often involve complex interpersonal issues, power dynamics, and sometimes cycles of abuse.

Q.6 Purpose of prison

The purpose of prison typically includes the following key objectives:

1. **Punishment:** Imposing a penalty on those who commit crimes.
2. **Deterrence:** Discouraging both the individual and others from committing crimes.
3. **Rehabilitation:** Providing programs and support to help inmates reintegrate into society.
4. **Protection:** Ensuring the safety of the public by removing dangerous individuals.
5. **Retribution:** Offering a sense of justice to victims and society.

Psy511 paper#7

Q.1 How can behavior change solve environmental problems?

Behavior change can solve environmental problems by encouraging individuals and communities to adopt more sustainable practices. This can include reducing waste, conserving water, using energy more efficiently, choosing sustainable products, and supporting policies that protect the environment. When people make environmentally-friendly choices, it can lead to a significant reduction in pollution, resource depletion, and habitat destruction, ultimately helping to mitigate climate change and preserve natural ecosystems.

Q.2 Acculturation

The learning of a new or foreign culture is called Acculturation. Culture is a dynamic process, and it evolves and changes. Nowadays a lot of information comes through computers, which helps with acculturation, and we learn about other cultures.

Q.3 Primary and secondary significance in culture adaption

Primary appraisal: Interpretation of threat

Primary Appraisal: The process of recognizing and assessing the significance of an environmental stressor.

Secondary Appraisal: The assessment of one's resources and options for coping with the stressor.

Primary appraisal involves interpreting the situation and assessing its potential threat. This initial evaluation influences how individuals perceive and react to stressors. Appraisal of potential stressors depends on several factors including attitudes toward the source of noxious stimulation. Our attitudes and perceptions significantly influence how we perceive and respond to stress

Q. Hans sleye types of stress

Hans Selye's concept of stress unfolding in three stages:

- Alarm Reaction: Initial response to stress triggers adrenal activity.
- Stage of Resistance: Body attempts to cope with stress demands.
- Stage of Exhaustion: When coping mechanisms are overwhelmed.

Q. Inner and outer density

Defining Density

Researchers use various terms like crowding or density interchangeably but lack consensus on their exact definition.

Schmitt (1966) distinguished between inside (living space) and outside (community) density. This differentiation helps understand variations in social effects across different environments.

Inner Density: Refers to the density within the core or interior of an object or material.

Measured by examining the mass per unit volume within the central regions, often using techniques like X-ray or MRI.

Less influenced by external environmental factors such as temperature, pressure, or wear and tear.

Outer Density: Refers to the density at or near the surface of an object or material.

Measured by assessing the mass per unit volume at the surface, often using methods like surface scanning or displacement.

More susceptible to changes due to external conditions, including weathering, corrosion, or physical damage.

Q. World Population trends in different countries

By 2030, the global population is expected to reach 10 billion, and by the end of the 21st century, it may rise to 30 billion. Some regions, like Sub-Saharan Africa and the Himalayan areas, already exceed their capacity to sustain life. Pakistan Population Trends Pakistan's population is projected to double by 2050. The high birth rate and low death rate contribute to this growth trend.

Q. Urbanization in Pakistan 1951 to 2005

Sindh: Urban population grew from 17.4% (1951) to 32.5% (1998), estimated at 35% in 2005. Sindh is the most urbanized province.

NWFP: Least urbanized with 17% urban population (1998 census).

Punjab and Baluchistan: Urban populations were 31% and 23% respectively in 1998. Urban population growth is higher in Baluchistan and Islamabad.

Urban Centers of Pakistan:

Sindh: Over 60% of the urban population lives in Karachi.

Punjab: 22% live in Lahore.

Peshawar: 33% of the urban provincial population.

-Quetta: 37% of Baluchistan's urban population.

Urban Population Concentration: - Half of Pakistan's urban population lived in eight major cities by 2005.

Q. Self bias and example

Self-serving bias means that we attribute success to internal factors and failure to external factors.

Example: Like they say, nothing succeeds like success and failure has many excuses. When a person is successful, that person is successful and that means that success becomes part of that person and we do not say that this person is successful because of certain external factors. We simply say that that person is successful, and we come to think that that person might be very, very intelligent. So self-serving bias is attributing success to internal factors and failure to external factors.

Psy511 paper#8

Q.1 Measuring Stress Psychologically

When we talk about psychological assessment, we note down all factors that contribute to behavioral patterns. Psychological measurement of the stress response has focused on various psychiatric symptoms and has utilized a variety of standard psychiatric symptom inventories. The common denominator among the various scales seems to be the extent to which respondents perceive themselves to be in an intractable situation marked by negative affect and a degree of uncertainty.

Q.2 Physical layout in classroom affect to learning

The physical layout of a classroom can significantly impact learning. Here are some ways it can influence students:

1. **Comfort and Engagement:** A well-designed layout can make students feel comfortable and engaged, which can enhance their focus and participation in lessons.
2. **Interaction and Collaboration:** Seating arrangements that promote interaction, such as circular or small group setups, can encourage collaboration among students.
3. **Teacher-Student Dynamics:** The arrangement of desks relative to the teacher's position can affect how instruction is delivered and how students interact with the teacher.
4. **Accessibility to Resources:** Easy access to learning resources, like books, computers, and instructional materials, can improve efficiency and reduce disruptions during lessons.
5. **Distractions and Focus:** Minimizing distractions, such as noise or visual disruptions, can help students stay focused on their learning tasks.
6. **Flexibility:** Flexible seating options can accommodate different learning preferences and needs, promoting a more inclusive learning environment.

Overall, thoughtful consideration of the physical layout can create an environment that

supports learning and student engagement.

Q.3 Self serving bias and example

Self-serving bias means that we attribute success to internal factors and failure to external factors.

Example: Like they say, nothing succeeds like success and failure has many excuses. When a person is successful, that person is successful and that means that success becomes part of that person and we do not say that this person is successful because of certain external factors. We simply say that person is successful, and we come to think that that person might be very, very intelligent. So self-serving bias is attributing success to internal factors and failure to external factors.

Q.4 How we can control population?

Controlling population growth can be approached through various strategies:

1. Education: Educating people, especially women and girls, about family planning and reproductive health can lead to informed decisions about family size.
2. Access to Contraceptives: Providing easy access to contraception helps people plan their families and prevent unintended pregnancies.
3. Healthcare Services: Improving overall healthcare services, including maternal and child health, can reduce birth rates.

4. Economic Incentives: Offering incentives for smaller families, such as financial benefits or subsidies, can encourage population control.
5. Government Policies: Implementing and enforcing policies that support family planning and population control can have a significant impact.
6. Cultural and Social Programs: Promoting social norms and cultural practices that support smaller families can contribute to controlling population growth.
7. Urban Planning and Development: Effective urban planning can help manage population density and ensure sustainable growth in urban areas.

Combining these strategies can create a comprehensive approach to managing population growth effectively.

Q.5 Why does altruism decrease due to social diversity?

Altruism can decrease due to social diversity for several reasons:

1. In-group vs. Out-group Dynamics: People may feel more inclined to help those who are similar to them (in-group members) rather than those who are different (out-group members), leading to reduced altruistic behavior towards diverse groups.
2. Reduced Trust: Social diversity can sometimes lead to reduced trust and empathy among individuals, which can diminish the likelihood of altruistic actions.
3. Perceived Competence: When interacting with people from different backgrounds,

individuals might question the competence or intentions of others, affecting their willingness to offer help.

4. Cultural Differences: Different cultural norms and values regarding helping behaviors can influence how altruism is expressed and perceived in diverse settings.

These factors can contribute to a decrease in altruistic behavior in diverse social environments.

Psy511 paper#9

Q.1 How is crowding related to the concept of behavior?

Crowding affects behavior in several ways:

1. **Stress and Anxiety:** High density can lead to increased stress and anxiety, affecting overall well-being and behavior.
2. **Aggression:** Crowded conditions may lead to higher levels of aggression and hostility, as individuals may feel their personal space is invaded.
3. **Social Interactions:** Crowding can influence social interactions, making people more irritable and less cooperative.
4. **Cognitive Performance:** High density can impact cognitive functions, leading to

decreased concentration and productivity.

5. Social Norms: The presence of many people can alter social norms and behavior, sometimes leading to reduced adherence to social norms or increased deviant behavior.

Overall, crowding can significantly impact psychological and social behavior.

Q.2. Components of Hardy personality

The key components of a hardy personality include:

A strong sense of commitment

A perception of challenges as opportunities for growth

A belief in one's ability to exert control over their life.

Q.3. Antecedent and consequent strategies

Antecedent Strategies: Use prompts and cues to encourage eco-friendly actions.

Effective prompts are specific and polite.

Examples: "Help keep your pool clean." "Please avoid littering."

Consequent Strategies: Use consequences to reinforce or discourage behaviors.

Reinforcement: Increase desired behaviors.

Punishment: Decrease undesirable behaviors.

Q.4 Modern Agriculture:

Intensive farming practices have led to declines in plant and animal species due to habitat destruction and chemical use.

Q.5 Urban-rural comparisons

Urban life can be the lowest income in the years of the year.

When people compare both lives, they bring up their own points of use into that. They might say that rural life is very good, calm, and serene. And then there might be people who might say that urban life is wonderful because you have all the facilities and entertainment available to you. We start our comparison with the physical and health diseases that are found prevalent in the people of rural areas and the people of urban areas.

- Urbanites are less affiliative towards strangers than are people in the rural areas.
- Urbanites tend to avoid eye contact with strangers and are less likely to reciprocate friendly gestures than rural dwellers.
- People living in the cities are very bad because they have a lesser affiliation towards other people than the people living in the rural areas.
- In urban areas, the incidence of crime has been quite high. And in the rural areas, the incidence of crime has been quite low.

- Alcoholism and drug addiction are more common in cities than in rural areas.
- Certain diseases are more specific to city life and there might be certain diseases that could be more specific to urban life.

Psy511 Paper# 10

Q.1 Three environmental factors increasing stress

Three environmental factors that can increase stress are:

1. **Noise Pollution:** Constant exposure to loud noises can elevate stress levels and impact mental health.
2. **Overcrowding:** Living or working in crowded spaces can lead to feelings of claustrophobia and stress.
3. **Poor Air Quality:** Exposure to pollutants and allergens can cause physical discomfort and stress.

Q.2 Name at least three alarming facts of Pakistan that need consideration

High Poverty Rate: A significant portion of the population lives below the poverty line, affecting access to basic necessities and services.

Water Scarcity: Pakistan faces severe water shortages, exacerbated by mismanagement and climate change, impacting agriculture and daily life.

Security Concerns: Ongoing issues with terrorism and internal conflicts continue to pose threats to national stability and public safety.

Q.3How to reduce the energy consumption in commercial buildings provide three strategies

Commercial buildings often exhibit excessive energy consumption due to design choices such as extensive glass usage and tall structures. For example, buildings like the Sears Tower in Chicago consume more electricity than entire towns. Implementing energy-efficient design principles and modifying appliance usage can lead to significant energy savings in commercial buildings.

Three strategies:

Implement Energy-Efficient Lighting: Replace traditional incandescent bulbs with LED or CFL lights, and use motion sensors and timers to ensure lights are only on when needed.

Upgrade HVAC Systems: Regularly maintain heating, ventilation, and air conditioning (HVAC) systems and consider upgrading to more energy-efficient models. Use programmable thermostats to optimize heating and cooling schedules.

3. Improve Insulation and Building Envelope: Enhance insulation in walls, roofs, and windows to reduce the need for heating and cooling. Use energy-efficient windows and doors to minimize heat loss and gain.

These strategies can significantly reduce energy consumption and operational costs in commercial buildings.

Q.4 Human Population Growth and Environment

The human population of 6000 B.C. was estimated to have been about 5 million people. By A.D 1650 our numbers reached 500 million and in the succeeding two hundred years we had doubled our numbers to 1 billion. In 80 years, by 1930, we had doubled them again. The current rate of population doubling is approximately 35 years (Ehrlich, 1968); that is, at current growth rates, we can expect the number of human beings inhabiting the earth to double every 35 years and to quadruple within the expected life span of any given individual.

Growth rate = Total Births – Total Deaths

Psy511 paper#11

Q.1 Significance of queuing theory in optimizing custom service in retail setting and provide real life example

Queuing theory helps optimize customer service by reducing wait times and improving service efficiency.

Example: Super markets using multiple check outlines to manage customer flow.

Q.2 Define conformity and write its example

Conformity is adjusting one's behavior to match the norms of a group.

Example: Dressing similarly to friends to fit in.

Q.3 How Asian British individual and Southern European different in adaptability to high density living species

Adaptability to High-Density Living: Asian British vs. Southern European

Asian British: May adapt better due to cultural norms that emphasize community and collective living.

Southern European: Might prefer more personal space and may find high-density living more challenging due to different cultural expectations.

Q.4 How attitude toward the source of stress can impact stress perception?

Impact of Attitude toward the Source of Stress on Stress Perception

Positive Attitude: Viewing the source of stress as a challenge or opportunity can lessen its perceived impact, making it easier to manage.

Negative Attitude: Seeing the source of stress as a threat or overwhelming can increase its perceived severity, making it harder to cope with.

Q.5 Types of density with example

Inside Density: The number of people within an indoor space.

Example: A packed restaurant or a crowded office.

Outside Density: The number of people in an outdoor area.

Example: A busy park during a festival or a crowded beach.

Q.7 Types of appraisal according to Schmitt

Long Questions

Q.1 Describe Behavioral Solutions to Environmental Problems with Examples

Recycling Programs: Encouraging people to separate and recycle waste materials to reduce landfill use and resource consumption.

Energy Conservation: Promoting habits like turning off lights when not in use or using energy-efficient appliances to reduce energy consumption.

Q.2 How interpersonal attraction liking change to high social density places

Increased Density: In high-density environments, such as crowded public places, interpersonal attraction can decrease due to heightened stress and reduced personal space. People might feel more uncomfortable or irritated, which can affect their interactions and willingness to form new connections.

Asia Context: In some Asian cultures where high-density living is common, social norms and shared experiences might help mitigate the negative effects, allowing for a more harmonious interaction despite the density.

Psy511 Final term subjective July 2024

Regards: Be Kind To Yourself (S.Malik)

Q.3 How technology impact cultural evolution and change

Accelerates Change: Technology speeds up the dissemination of new ideas and trends, leading to rapid cultural shifts.

Global Connectivity: It facilitates global communication, allowing different cultures to influence each other more readily.

New Norms: Technology creates new social norms and behaviors, such as online interactions and digital media consumption, altering traditional cultural practices.
