
Lesson-21

CUP, BICS, AND CALP

All were introduced by Jim Cummins for L1 & L2.

Topic-074: Cummins and Swain Common Underlying Proficiency (CUP)

(CUP) model was introduced by Cummins and Swain (1986) as common underlying proficiency model. According to Cummins and Swain, people who are learning second language follows a framework of language structures and functions driven from a person's knowledge of one language to help him or her learn the second or additional language known as CUP. * CUP learner has not to learn the basics of schooling in SL.

The CUP model is represented with the 'dual iceberg metaphor' and is the basis of the hypothesis called the 'Linguistic Interdependence Hypothesis' according to which the first language has a relationship with other languages which is different form the surface but interdependent internally. The relationship is based on Separate Underlying Proficiency (SUP) vs. Common Underlying Proficiency (CUP). 'Additive bilingualism' and 'subtractive bilingualism' were also proposed by the model for determining the proficiency. Based on meaningful exposure & experience with a language individuals develop CUP skills which enable the development of cognitive and academic skills.

Difference on the above surface bot actually inter-dependent psycologically

adding + not replacing

acted at the expense

Topic-075: Basic Interpersonal Communicative Skills (BICS)

they occur in a meaningful social context, not very demanding cognitively, and language required is not specialized.

According to Cummins, Basic Interpersonal Communication Skills (BICS) are considered to be not very demanding as they are the language skills needed in social situations. Being engaged in day-to-day language process, these skills require social interaction which is usually context driven. According to Baker (2006), 'BICS is said to occur when there are contextual supports and props for language delivery. Face-to-face 'context embedded' situations provide, for example, non-verbal support to secure understanding. Actions with eyes and hands, instant feedback, cues, and clues support verbal language.'

Here so..

To Concludes: BICS refer to the basic language ability required for face-to-face communication where linguistic interaction are embeded in a situational context called context embeded lang.

Context Embeded language: It is a result of student interaction with each other to get interpersonal clues to further construct meaning.

Some of the examples of BICS are:

- Observing speakers' non-verbal behavior (gestures, facial expressions and eye actions)
- Observing others' reactions
- Using voice cues such as phrasing, intonations, and stress
- Observing pictures, concrete objects, and other contextual cues

BICS are primarily concerned with conversational fluency (Basic Interpersonal Communicative Skills) in the second language; whereas, CALP relates to the use of language in decontextualized academic situations (Cognitive Academic Language Proficiency).

Topic-076: Cognitive Academic Language Proficiency (CALP)

To conclude: CALP is the term used in academia which is often decontextualized. This language often involve large and uncommon words used with little face-to-face reinforcement.

Cognitive academic language proficiency (CALP) is a term proposed by Jim Cummins which refers to the stage of learning that learners go through after they have mastered social language communication skills. It is the stage where the development of academic language proficiency takes place in context reduced academic situations. 'Where language is *disembedded* the situation is often referred to as *context reduced'* (Baker, 2006, p. 174). In CALP, development of academic language is often abstract,

©Copyright Virtual University of Pakistan

1:.. SUP: No relationship exist b/w the first and other language and that lang. work independently in the CPS.

The Threshold Hypothesis:.. assumes that a child needs to achieve level of proficiency or competence in First or S.L to take advantage of the benefits of bilingualism.

Scanned by CamScanner

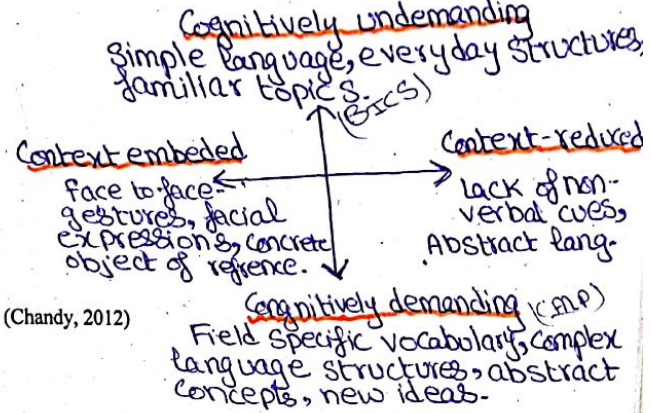
and non-verbal clues are absent. One's cultural/linguistic knowledge is often required for complete comprehension. Cummins argues that 'teachers are unaware of the need for explicit teaching of academic language.'

Topic-077: Comparison of BICS and CALP

The comparison between BICS and CALP has been drawn based on the suggested activities.

CALP: Suggested Activities

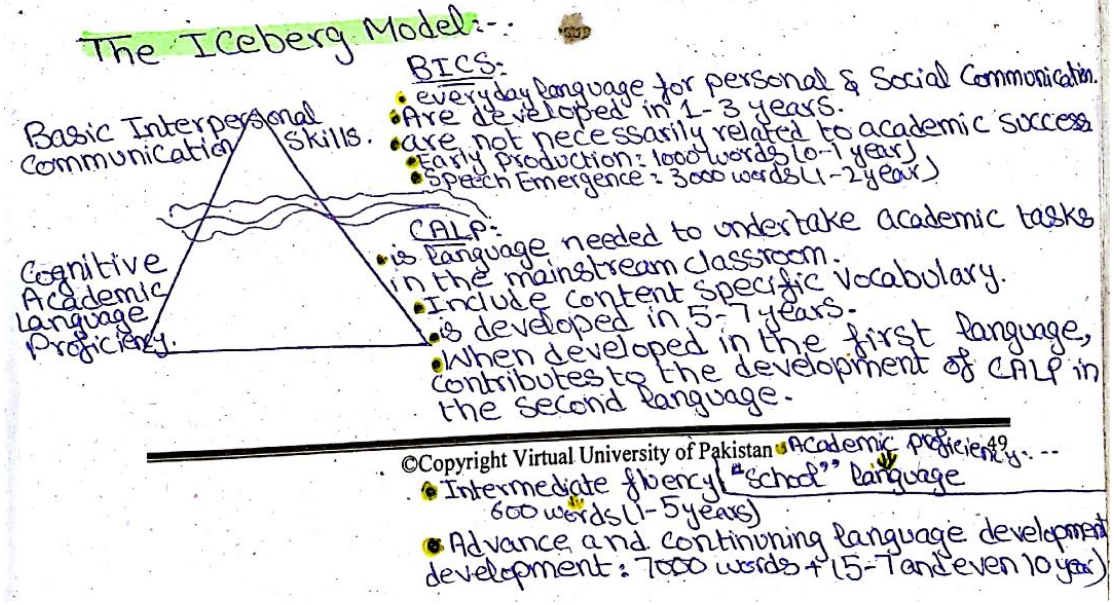
- Writing story innovations
- Holding book reviews
- Enacting plays
- Discussing what you have read
- Collecting words
- Conducting debates
- Selecting role-plays
- Presenting thematic viewpoints (Chandy, 2012)



BICS: Suggested Activities

BICS is about the language skills that students need to get through the day in face-to-face situations (Chandy, 2012).

- Visuals: pictures, books and magazines with pictures, photos, objects, maps, charts, graphic organizers, drawings, role-playing, games, etc.
- Simplified language and texts, translations, summaries of texts by peers
- Gestures, pantomimes, experiences, demonstrations, hands-on activities
- Samples, exemplars, models



©Copyright Virtual University of Pakistan

Scanned by CamScanner

extra-ordinary (imp)

Topic: 77: Comparison of BICS and CALP

BICS	CALP
• Language that is used in communication among friends, or with strangers, or in real communication about any and all aspects of life.	• Language that is used in the content areas, the language for high level critical thinking, for hypothesizing, for talking Math, Chemistry, Health etc.
• To develop BICS, students must be provided with many opportunities for role playing language situations and sophisticated social interaction.	• A student is not proficient in English until (s) he masters CALP, CALP must be the lang. development focus of ALL instructional programe for ALL st.
• BICS include idiomatic expressions and proverbs, sayings, and colloquial expressions.	• To develop CALP students must be provided with many opportunities to observe, to listen, and speak about content area concepts in real life situations. In addition, students need to master reading and writing using CALP.
• Knowledge of BICS is very important to feel comfortable and to use socially appropriate language, in real-life communication situations.	• Knowledge of CALP insures academic sucess, Knowledge of CALP is essential for academic success and higher education, and for critical thinking.

Scanned by CamScanner

To Conclude:

BICS refer to the basic language ability required for face-to-face communication where linguistic interactions are embeded in a situational context called context-embeded language and CALP refers to higher-order language skills that are essential for problem solving inferring, analyzing synthesizing, and predicting in decontexualized or reduced context.

Lesson 2.2 Second Language Learning Research and Language Education

Topic: 78:-- Goal of Language Learning Research

General - Language for no purpose) courses at any proficiency level almost always teach too much, e.g., vocabulary, skills, registers or styles some learners do not need, and to little, e.g. omitting lexis and genres that they do. Instead of a one-size-fits all approach, it is more defensible to view every course as involving specific purposes... (Long, 2005)

Scanned by CamScanner

Development Stages

Stage	1970s-1980s	1980s-2000s	21st century
Teaching Models	Structural	Communicative	Integrative
View of Language	Structural (a formal structural system)	Cognitive (a mentally-constructed system)	Socio-cognitive (developed in social interaction)
English Teaching Paradigms	Grammar Translation & Audio-lingual	Communicative language Teaching.	Communicative language Teaching Content-Based ESP/EAP.

- Teaching and learning is to created such a learning environment where students' knowledge construction can be facilitated.
- Such an environment is one in which students are challenged without being frustrated, and in which they are focused on intentional learning to fulfill a set of learning goals (**Jonassen et al., 2003**).
- 21st century classroom needs students to face real-world problems that engage them in higher-order thinking skills-creativity, innovation, communication, collaboration, critical thinking and problem solving. (**Jonassen & Reeves, 1996**)
- For effective ESP learning, construction of knowledge happens in a social content

Scanned by CamScanner

(Duffy & Jonassen, 1991), such as classrooms and language laboratories "where students join in manipulating materials and, thus, create a community of learners who built their knowledge together." (Dewey, 1966)

- "Students might not only choose what to study but how and why that topic might be an interesting one to study." (Burnard, 1999)

The Material: (the content) should be provided by the professors or experts in the subject. It should always be authentic (the main purpose of teaching skill is to enable students to deal with authentic information despite their level of English), up-to date (the informational representative for their target language use situating) (Bojovic, 2006).

The Interplay b/w Research & Teaching:-

- Pica (2005) mentions that "as teachers and researchers, we cannot work in isolation each other if we are to help our students meet their needs and acomplish their goals."
- Teachers should know what students learn, how and why instruction influences such learning and how lessons could be based on this information to be more influential when teaching them next time. (Berk, Hiebert, Jansen and Morris, 2007).

Scanned by CamScanner

• Mechanical way of introducing language or to present language as a whole in chunks, (cf. Widdowson, 1990). language is for communication not for exercising linguistic items).

To Conclude:-

The ultimate goal of language learning research should be to equip students to face real-world challenges that engage them in higher order thinking skills by using the theoretical as well empirical research of SLA.

Topic: 79:- Second language Learning Research and Language Education. Bridging Language Learning Research and language Education.

• Language teachers are required not only to teach in the classroom but also to do research to keep pace with the new developments and trends of teaching.

• Knowldge is constructed in the content of the environment in which it is encountered through the social and collaborative process (Kanuka and Anderson, 1999).

The teacher is more of a consultant who has the knowldge of communication practices but needs to "negotiate" with the students on how best to explore these practices to explore these practices to meet the specific objectives. For bridging language learning

Scanned by CamScanner

research and language education

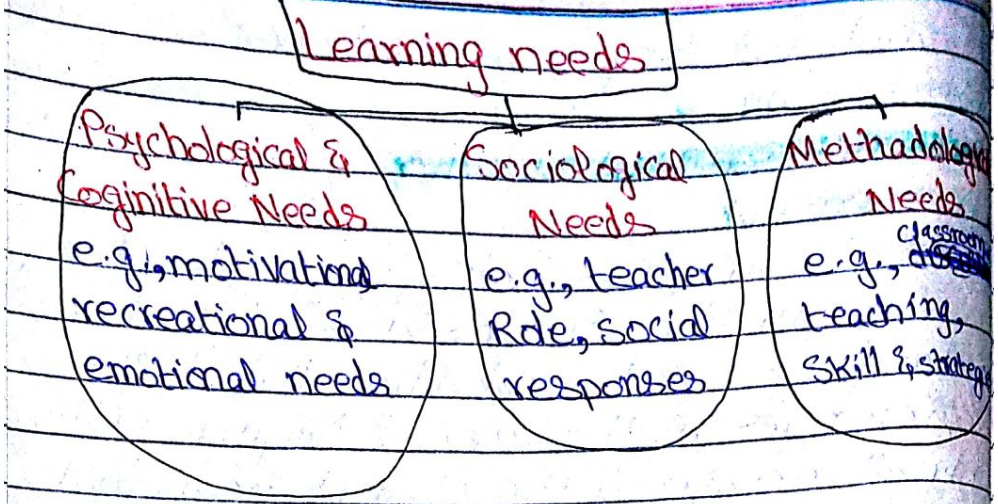
- Need analysis
- Determining Methadologies
- Assessment

.. needs analysis helps us as teacher to identify the students' needs in terms (perspective preferred needs) of language skills and the students' deficiencies in the area of language skills only after analyzing the students needs and determining the objectives of the language course, we can select the material that meets the needs of the students. Thus, needs analysis is the foundation on which we can develop curriculum content, teaching material and methods that can lead to increasing the learners "motivation & success" (Otilia, 2015).

Various Definitions (NA):

- "Situations where the students has some specific reasons to learn a language." Harmer [1:17]
- "An approach to language teaching in which all decisions as to content and methods are based on the learners' reason for learning." [2:19] Hutchinson et al.

Scanned by CamScanner



Methadologies Include:

- Grammar Translation
- Direct Method
- Audio-lingual Method
- Situational language learning
- Suggestopedia
- The Silent Way
- Total Physical Response
- Commounity language learning
- Communicative language Teaching Task Based Learning.

Assessment:-

- Placement assessment: To ensure that the course is not going to be too easy or too difficult for the learner.
- Observation of Learning: Activities that the learners do are carefully monitored to see if each particular activity is likely to achieve its learning goal.
- Short-term achievement Assessment:- Monitoring what learners are learning from the course.

Scanned by CamScanner

• Diagnostic Assessment:-

The aim of diagnostic assessment is to find the gaps weaknesses and provide a remedy for them.

• Achievement Assessment:-

The learners are assessed on what they have learned to determine the effecti-veness of methodologies

• Proficiency Assessment:-

Proficiency assessment is based on items drawn from the language as a whole rather than from the content of a particular course.

To Conclude:-

Analysis of learners' needs, determining appropriate approaches and assessment mechanism contribute effectively in bridging language learning research and education.

Topic: 80:- SLA Research and Working Beyond Teaching Methods.

• When (SLA) research began to emerge as a separate discipline, one of the hopes was that it would benefit language teaching (Corder 1973; Stern 1983).

• Recently SLA research has mostly seen its role as raising teachers' awareness of SLA concepts rather than affecting teaching

Scanned by CamScanner

directly, Markee (1993) for example sees SLA research as "a resource for changing teachers' professional cultures." (Cook, 1999)

"SLA research includes both general as well as specific theories.

Teaching, too, ranges from overall goals for language teaching to specific teaching techniques used with a particular group of learners." (Cook 1992).

"Linking research to teaching means employing both these scales of general to specific, on the one hand using general SLA theories for either general or specific aspects of language teaching, on the other using specific SLA results in specific teaching areas." (Cook, 1999).

Lightbown and Spada (1993) proposed the following for classroom teaching and research associated with each.

- Methods based on the behaviorist theory of language learning emphasizing accuracy and form and not allowing errors;
- Methods based on the interactionist theory giving learners the opportunity for conversation where they recieve meaningful input from teachers and students, which will in turn lead to acquistion of the grammar and words

Scanned by CamScanner

of the second language.

- Methods based on the "comprehensible input" theory most closely associated with Stephan Krashen, where the emphasis in no on the interaction, but on providing input through listening and/or reading;
- Methods based on teaching what the learne is ready to learn, most closely associated with Manfred Pienemann; and
- Methods that "recognize a role for instructi but also assume that not everything has to be taught." (Lightbown and Spada, 1933).

Focus on form an important area of SLA and poses challenge as how to include form-focuse activities in communicative contexts.

Following uses of form-base knowledge has have been suggested:-

- Plaining and monitoring output;
- Noticing features in the input;
- Noticing the gap blw their own productio and the target;
- Speeding passage through developmental sequences; (Haley & Rantz, 2002.)

To Conclude:-

SLA research offers a wide variety of concepts and frameworks for teachers to enable them to assess and determine the

Scanned by CamScanner

best suitable teaching pedagogies for their classrooms.

Lesson 23 Directions for Research in language learning

Topic:81:-- Research within Applied Linguistics.

Understanding Applied Linguistics:

According to Davis and Elder (2007) applied linguistic deals with determining social problems involving language. The main issue include, how to: teach language more effectively, enhance the training of translator and interpreters, diagnose speech pathologies more efficiently; evaluate a bilingual programme, Set a valid language test, help discuss the language used in a text, decide on the literacy levels of a population study, as well as compare and contrast the acquistion of the different languages.

Definitions of Applied Linguistics;

Grabe (2002) defines applied linguistics as a 'Practice-driven discipline that addresses language-based problems in real-world contents' Schmitt and Celce Murcia (2002),: applied linguistic is using what we know about language, how it is learned, and how it is used, in order to achieve some purpose or solve problem in the

Scanned by CamScanner

real world.

Applied linguistics covers eighteen topics areas as a minimum.

These are:

1. Language and its acquisition;
2. Language and Culture;
3. Language and Cognition;
4. language and the brain;
5. Language and Media;
6. language and Assessment;
7. ——————— Interaction;
8. - - - - - - Ideology;
9. - - - - - - Listening;
10. - - - - - - Instruction;
11. - - - - - - Reading;
12. - - - - - - Policy;
13. - - - - - - Writing;
14. - - - - - - Speaking;
15. - - - - - - Society;
16. - - - - - - Research Methadology;
17. - - - - - - Technology;
18. - - - - - - Translation/interpretation

Out of these areas, the dominant area has been second/foreign language acquisition and teaching.

Grant (2010) explains the research in applied linguistics is a process of arriving at answers

Scanned by CamScanner

to questions situated in current understandings employing a methodologically rigorous way.
Five main characteristics of research within applied linguistics are:
•Empirical •Logical •Reductive •Planned •Imaginative (Alami, 2015).
McDonough & McDonough (2005), sums up research in four features:
•interest, •originality, •specificity and •Dissemination of both research questions and finding.
Nunan (2005): Research in AL is concerned with enquiry; product and process..." a researcher needs to keep in mind a set of questions to be used as guide whilst conducting his/her research"

To Conclude:

Applied linguistics is mainly concerned with the meaningful applications of researche proposed solutions to existing problems related to language use. Research within the field of applied linguistics is primarily to enhance our understanding of related issues by generating knowledge effectively. Our claims should be supported by detailed exploration, investigation, experimentation, and examination.

Scanned by CamScanner

Topic:82: Explicit and Implicit learning and Awareness

SLA researchers term learning as explicit when rules are emphasized. Anything that makes learners aware of rules in explicit.

Implicit learning refers to the ability of acquiring new knowledge without intending to do so, does not involve deliberate efforts.

Bialystok (1978) proposed a similar model to Krashen's, distinguishing b/w an Explicit Linguistic knowledge source, containing all the 'concious' facts the learner has about the L2, and an implicit linguistic knowledge source, containing 'intuitive information' that cannot be verbally described.

Rod Ellis' (2009) distinction:

Implicit/explicit learning and implicit/expl s'

Knowledge are 'related but distinct concept that need to be seperated,' the former refers to the process involved in learning, the latter concerns the product of learning

Schmidt also argued that learning needs to be distinguished from instructions. It does not follow, for instance, that implicit

Scanned by CamScanner

instruction results in implicit learning or conversely, that explicit instruction leads to explicit learning.

Learners have minds of their own inclinations irrespective of the nature of instruction they recieve (Allwright, 1984).

Dornyei's (2009) Distinction:

Explicit learning refers to the learner's concious and deliberate attempt to master some material or solve a problem. In contrast, implicit learning involves acquiring skills and knowledge without conscious awareness, that is, automatically and with no consicious attempt to learn them.

Implicit VS Explicit Instruction

Implicit EFI	Explicit EFI
Attracts attention to target form.	Directs attention to target form
Spontaneously (communication-oriented activity)	Predetermined & planned (the main focus & goal of a teaching activity)
Unobstrusive (minimal interruption of communication of meaning)	Obtrusive (interruption of communicative meaning)
Present target form in context	Present target forms in isolation

Scanned by CamScanner

Implicit FFI	Explicit FFI
Make no use of metalanguage	Use metalinguistic terminology (rule explanation).
Free use of the target form	Controlled practice of target form

To Conclude:

Explicit learning refers to the learner's conscious and deliberate attempt to whereas, implicit learning involves acquiring skills and knowledge without conscious awareness.

Awareness plays a vital role in SLA as noticing and involving deeper analysis of underlying abstract rules.

Topic: 83:- Input, Output, and Freqency

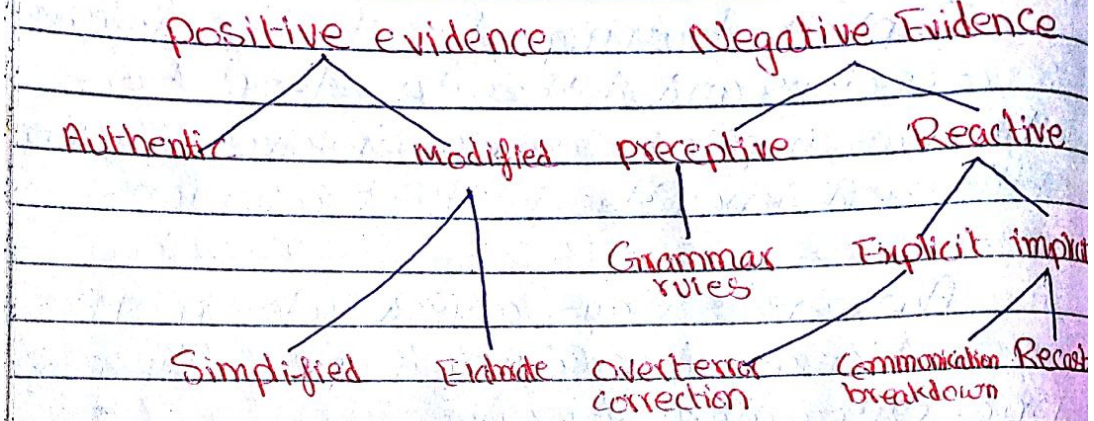
According to Corder, language input refer to what is available to be utilized by lang. learners for SLA which should be differentiated from intake which is that parts of the input which is comprehended by the lang. learners.

Oral and/or Written corpus of the target language (TL) to which L2 learners are exposed through various sources.

Two Factors: Availability and Accessibility

Scanned by CamScanner

The accepted, correct lang. elements of target language learners recieve through their exposure to L2 is positive evidence.



Negative Evidence is the "information about what is incorrect in the lang. produced by a learner & what is needed to make a correction to align the learner's language with the target lang." (Gass, 2002.)

Negative Evidence is "some kind of input that lets the learner known that a particular form is not acceptable according to target like norms." Mitchell and Myles (2004).

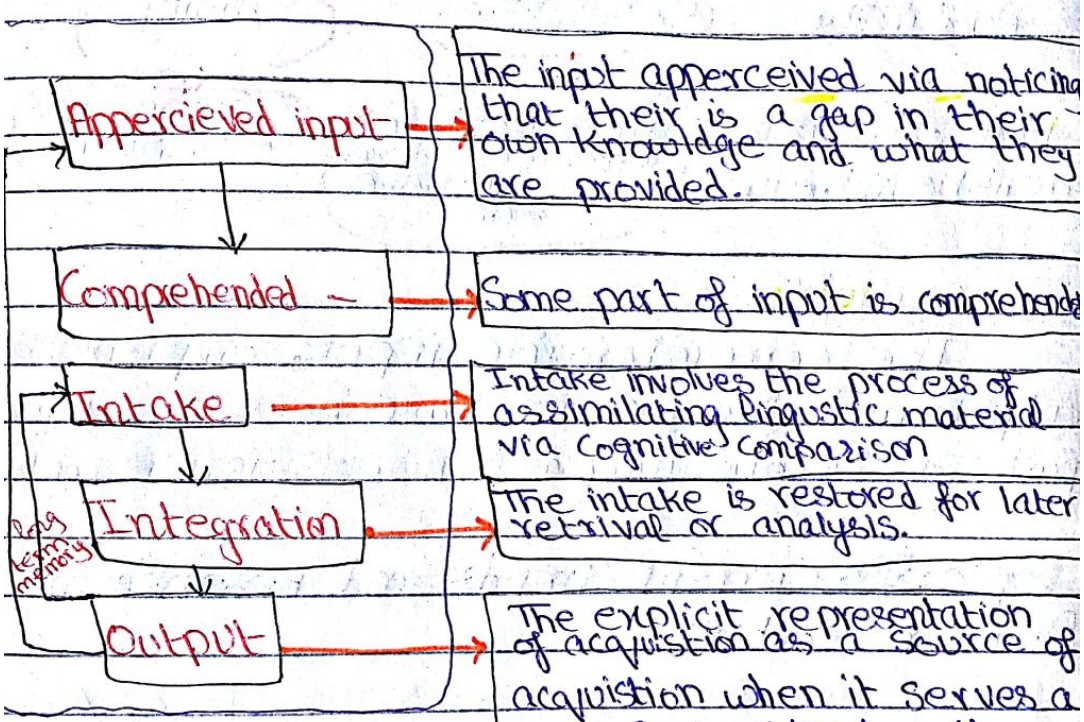
The Comprehensible output (CO)

Hypothesis states that "we acquire

Scanned by CamScanner

language when we attempt to transmit a message but fail and have to try again. Eventually, we arrive at the correct form of our utternace, our conversational partner finally understands, and we acquire the new form we have produced."

"Sometimes under some conditions, output facilitates second language learning in ways that are different form, or enhance, those of input." (Swain and Lapkin 1995)



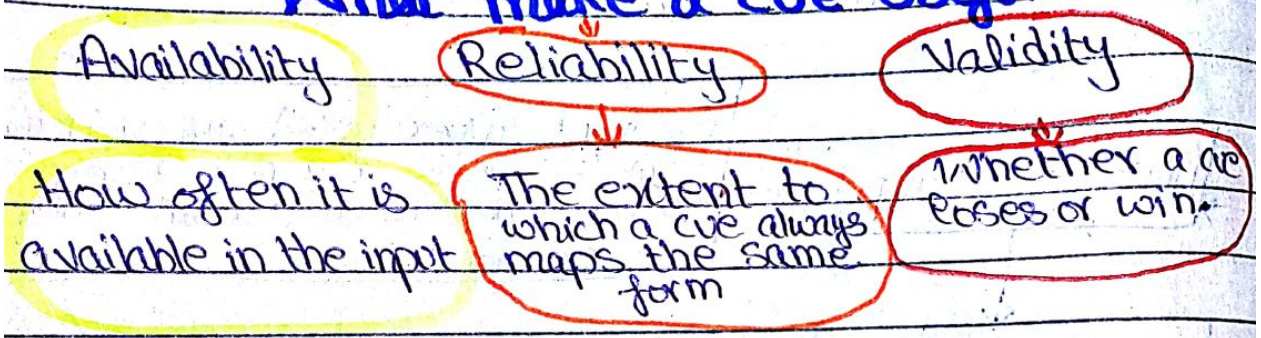
"Humans are sensitive to the frequencies of events in their experience," Ellis (2002)

Scanned by CamScanner

The Frequency Hypothesis
(Hatch and Wagner Gough)

- The Frequency Hypothesis → the order of L2 acquistion is determined by the frequency with which different linguistic items occur in the input (acquistion is input Dependent).
- Input frequency → enhance or lessen the form-function relationship by providing cues

What make a cue useful



To Conclude:

The comprehensible input, comprehensible output and frequencies have been an integral parts of Second Language Acquisition research

Topic:84: Current Trends and Research in Pakistani Context.

Scanned by CamScanner

The statistics regarding English language research show that:

- English language is a global language and more than 1.5 billion people in total (native and non-native combined) speak English.
- Extensively spreading in important fields including international commerce, education, and communication.
- Plays an important role as a channel of communication (Kannan, 2009).
- Asia is not an exception to such a global trend which is concerned with students' personal, linguistic, social, and cultural development (Le, 2004, p. 167).

Scanned by CamScanner

Current Trends and issues in English Language Education in Asia, survey.

English Language Education policies	• Lack of govt. support for English educatio (national policy problem): Taiwan (P), India (P/S), Pakistan (P/S), UAE (P). • Programmes not suitable for the cultural milieu of the learner. India • Implementation of primary English education. Japan (P). • Implementing policies (e.g., using IT in ELT, teaching): Thailand (S). • Research studies for Academic promotion: Thailand (S), Vitnam (S).
Class Size and hours	• Large size: Korea (P/S), Taiwan (P), the Philipines (P/S), Pakistan, Israel (P/S), • Lack of class hours: Korea (P), Taiwan (P/S), Iran.

Challanges as Second language difficulties for L2 learners

Unrealistic Teaching Material.

Lack of relevant Teaching Strategies.

Scanned by CamScanner

Teacher Challenges:-

Teaching English as a second language in different situations. Assessing second language learners with different abilities Facilitating the procedure of second lang. acquisition Learning expectations of the second lang. learners.

Direction for Research Inquiry. TESOL Association Research Agenda (2014).

Domains	Theoretical Perspectives on the Nature and Learning of Langs.
Individuals	• How does the proficiency of individual learners develop over time in distinct contexts of lang use? • How can/do lang. teachers promote the simultaneous development of multiple linguistic codes? • What instructional practices enhance students' abilities to function in diverse social settings, achieve personal goals, and interact in multilingual settings?
Community	• What role(s) do cross-age encounters play in promoting L2 learning in multilingual communities?

Scanned by CamScanner

- How can language teachers develop students' appreciation for and understanding of multimodal and/or multilingual discourse?
- How can language influence the peers in the development of learner's attitude towards the target lang. and the home languages?

Sociolect

- How do politicized discussion of lang. use and lang. importance impact the development of classroom materials?
- What is the effect of lang. planning and lang. policy (regional, state-wide, provincial, or national) on program designs and instructional practices in lang. classrooms?
- What role(s) does popular culture play in promoting lang. learning?

To Conclude:-

As per Asian survey, lack of government support for English education, large class size, lack of proper resources and materials, over-dependence on rote learning and testing-oriented system, lack of qualified Teachers and training sessions have been identifies as major issues concerning the language learning in

Scanned by CamScanner

Pakistani Context.

Lesson 24 Automaticity, Restructuring and Noticing.

Topic: 85: Mclaughlin's Automaticity & Restructur

McLaughlin argues (1990) that SLA process "lacking an adequate theory of mind that allows us to decide that particular mental states or operations are "conscious" or "unconscious," one cannot falsify claims regarding consciousne in second language learning."

Proposed Distinction b/w controlled and automatic processing instead of conscious/uncons Dichotomy.

Controlled Processing: requires attention and attention has a limited capacity, automatic processing does not require attention, and takes up little or no processing capacity.

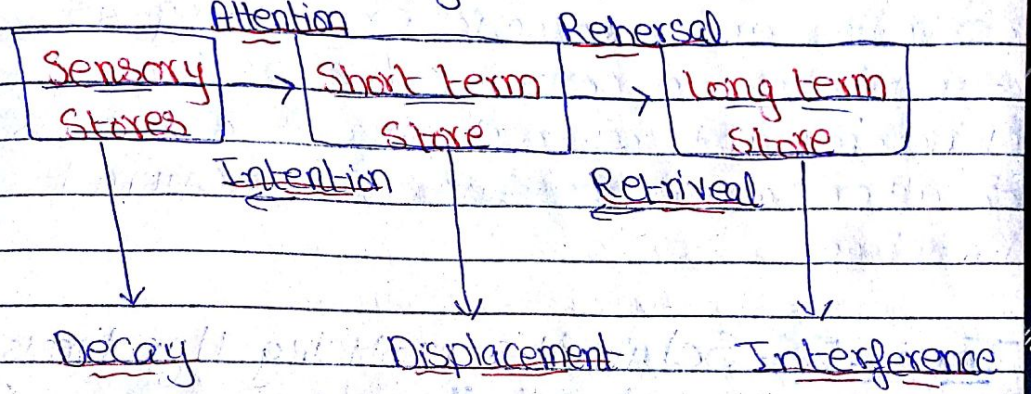
Mclaughlin uses the twin concepts of automaticity and Restructuring to describe the Coginitive process involved in SLA.

Automaticity occurs when an associative connection b/w a certain kind of input and some output pattern occurs.

Scanned by CamScanner

McLaughlin, (1987)

"Automatic processing is a rapid process and once it occurs it is difficult to suppress or alter... Controlled processes are thus tightly capacity limited, and require more time for their activation. But controlled processes have the advantage of being relatively easy to set up, alter, and apply to novel situations."



The Multi-Store Model of Memory

Three information processes:

Automatic processing, controlled processing and restructuring.

Processing information with great speed is called automatic Processing.

Information Processing says that learning is dynamic, so knowledge that is learned can be changed and altered when acquiring new information. This is called restructuring which allow student to increase in long learning

Scanned by CamScanner

and attain higher levels.

"Learning a second lang does involve the acquisition of a complex cognitive skill, but it involves the acquisition of a complex linguistic skill as well."
(McLaughlin 1987)

To conclude:

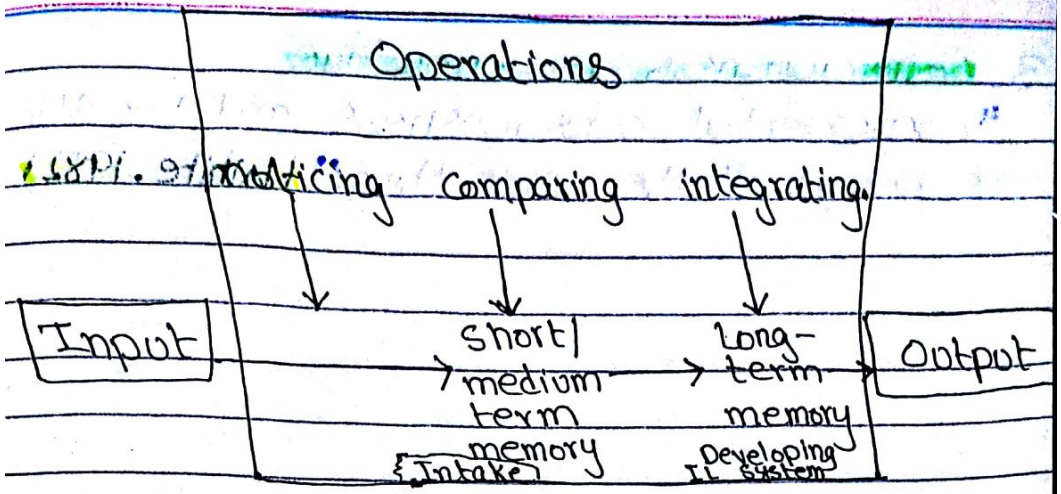
"McLaughlin proposed the concepts of controlled and automatic processing as substitutes to conscious/unconscious dichotomy and restructuring as a process of altering and modifying the acquired knowledge.

Topic: 86: Schimdt's Noticing Hypothesis

According to Schmidt "subliminal lang learning is impossible," and that "noticing is the necessary and sufficient condition for converting input into intake." (1990)

In response to Krashen (1981)'s claim that only subconscious process can guarantee successful L2 acquisition, Schmidt (1990) originally proposed the importance of the conscious mode of learning, evaluating noticing as a necessary and sufficient condition for L2 learning. (Ahn, 2014)

Scanned by CamScanner



From Schmidt's perspective, for learning to occur, attention and a low level of awareness (i.e., noticing), "conscious registration of the concurrence of some event" (Schmidt, 1995) are necessary, but high level awareness (i.e., understanding), "recognition of a general principle, rule, or pattern." (Schmidt, 1995), is not required. (Ahm, 2014)

1. Noticing as focal Awareness

We first notice the content/object and may pay attention to other associative factors may we choose to.

2. Noticing refers to a Private experience

Consciousness as intention is used to distinguish b/w awareness and intention behavior.

Scanned by CamScanner

3. Consciousness as knowledge

"experiential consciousness and knowledge are not at all the same thing." (White, 1982)

Scanned by CamScanner

Schmidt Proposes the following to address the ambiguities between Conscious and Unconscious learning:

1. **Unconscious learning refers to unawareness of having learned something.**
2. **Conscious learning refers to awareness at the level of noticing and unconscious learning to picking up stretches of speech without noticing them. Schmidt calls this the "subliminal" learning question: is it possible to learn aspects of a second language that are not consciously noticed?**
3. **Conscious learning refers to intention and effort. This is the incidental learning question: if noticing is required, must learners consciously pay attention?**
4. **Conscious learning is understanding principles of the language, and unconscious learning is the induction of such principles. This is the implicit learning question: can second language learners acquire rules without any conscious understanding of them?**
5. **Conscious learning is a deliberate plan involving study and other intentional learning strategies, unconscious learning is an unintended by-product of communicative interaction.**
6. **Conscious learning allows the learner to say what they appear to "know".**

Scanned by CamScanner

To Conclude:

Schmidt's Noticing Hypothesis Claims that nothing is learned unless it has been noticed, and noticing does not result in acquisition rather it is the starting point of the acquisition process.

L2 learners cannot acquire lang feature unless they are aware of it in the input.

25 Lesson — Interaction Hypothesis, Processability Theory, and Towfell and Hawkins Model of SLA

Topic: 87: Long's Interaction Hypothesis

Long (1981) proposed interaction Hypothesis and claimed that participation in conversation with native speakers, which is made possible through the modification of interaction, is the necessary and sufficient condition for second lang acquisition.

Long (1981) defines:

"Input refers to the linguistic forms

Scanned by CamScanner

used; by interaction is meant the functions served by those forms, such as expansion, repetition, and clarification."

Ellis (1991) states that IH propagates the two main claims about the role of interaction is second lang acquisition...

1. Comprehensible input is necessary for second lang acquisition.
2. Modifications to the interactional structure of conversations taking place in the process of negotiating a communication problem help to make input comprehensible to a second lang learner.

Long proposed the hypothesis, whereas Pica (1987) empirically investigated it.

Ellis (1991) noted that by carefully testing the claims of the hypothesis, Pica has extended IH in a main way by emphasizing the importance of the social relationship b/w participants as a determinant of international modification.

IH can be summarized as follows:

1. Comprehensible input is necessary for second lang acquisition
2. Modifications to the interactional structure of conversations taking place in the proces

Scanned by CamScanner

of negotiating a communication problem help to make input comprehensible to a second lang. learner.

3. Tasks where there is a need for the participants to exchange information with each other promote interactional structuring.

* A situation where the conversational partners share a symmetrical role relationship affords more opportunities for interactional restructuring.

In his updated versions of IH, Long (1996) emphasizes on the learner internal mechanisms when she/he is interactionally involved in modified output. Interaction is approached both 'interpersonally' and 'intrapersonally'. In the former IH, the learners notice input, while in the latter, they process information they got through input.

The interaction Hypothesis has been challenged by many researchers and theorists e.g. Ellis (1991, 1999). Ziglari (2008) summarizes Ellis's (1999) findings about the limitations of IH in the following:

Scanned by CamScanner

1. "Interaction facilitates comprehension (not cause it): when learners have opportunity to signal their non-understanding and try to ask for clarification;
2. There are individual differences with regard to the amount of their participation
3. Comprehension does not depend on negotiation, learners may benefit from the dialogic interaction by other learners,
4. Modified input facilitates acquisition of word meanings,
5. The most important factor to acquisition of word meaning is range (different contexts)."

To Conclude:-

The interaction hypothesis is a theory of second-lang. acquisition which refers to the development of language proficiency through face-to-face interaction and communication.

Comprehensible input is crucial for effective interaction.

Topic: 88: Processability Theory

Processability Theory was proposed by Manfred Pinemann refers to the gramatical development of learners' interlanguage.

Scanned by CamScanner

It is cognitively founded (hence applicable to any language), formal and explicit (hence empirically testable), and extended, having not only formulated and tested hypothesis about morphology, syntax and discourse pragmatics, but having also paved the way for further developments at the interface b/w grammar and the lexicon and other important modules in SLA.

The basis of PT is that at any stage of development, learners can produce (and comprehend) only those L2 forms which the current state of their language processor can handle (Pienemann 1998).

Understanding of language development on two formal models, describing and integrating (a) language generation, (b) linguistic knowledge.

For language generation, PT relys on Levelt's Model (1989) which refers to language processing in real time and within human psychological constraints, such as word access and human memory.

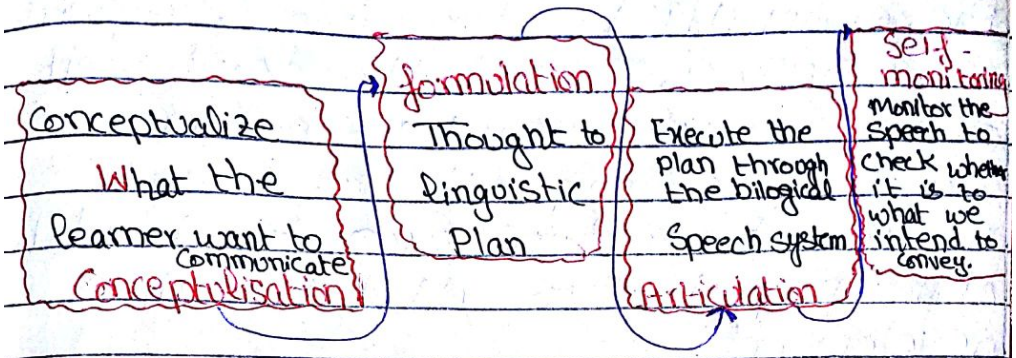
Contributes towards solving for SLA what is known as the "developmental

Scanned by CamScanner

problem'.

Why do learners follow universal stages of acquistion?

Levelt's Model (1989).



"LFG encodes syntactic properties primarily in the lexicon."

For linguistic knowldge, PT relies on Bresnan's (2001), lexical-Functional Grammar (LFG) as declarative, lexicalist approach to grammar is its principle of lexical integrity, according to which, from the point of view of syntax words cannot be divided into smaller units. That is, syntactic rules neither form words, nor do they access their internal structure.

Contributes towards solving for SLA the so-called 'logical problem': What is the

Scanned by CamScanner

origin of linguistic knowledge?
Why do people end up knowing more than they can hear? E.g., how does a learner know that words can be nouns, verbs, etc.
Pienemann (1998) understands development as a process in which the development of more complex structures happens gradually, beginning with the lowest number of structural properties, to which other properties are added through development.

Pienemann (1998) learner's interlang. stabiliz if the learner makes a large number of bad choices.

Pieneman and Kebler (2012) point out the following important factors in their explanation of the Processability Theory:
a) Second language development progresses according to universal stages which are limited by the language processing hierarchy.
b) Variability of interlanguage is limited and regular.
c) Tranfer from the first lang. is limited by the ability to process a certain structure

Scanned by CamScanner

d) Differences in tasks are limited by the language processing hierarchy.

e) Acquisition of both the first and second lang. is limited by the lang. processing hierarchy.

f) Bilingual language development can be universally compared for different languages using the lang. processing hierarchy described in PT.

To Conclude:

Processability theory looks into the development of interlanguage and proposes that L2 learners can ~~be~~ produce only those L2 structures which they can process at any given point in time emphasizing thus the fact that developmental stages cannot be escaped.

Topic: 89: Towell and Hawkin's Model of SLA

According to Towell and Hawkins (1994) SLA research has to deal both with the learner's attempts to learn the system and the learner's attempts to learn to use the system.

Learners exposed to SLA after the age of seven years can encounter ⁴multiplicity

Scanned by CamScanner

of knowledge sources."

Proposed Concepts of Declarative Knowledge and Procedural Knowledge.

Universal Grammar is a constant background to the lang. learning process. It is therefore the background against which any lang learning process takes place like any background, it conditions but does not determine what happens.

The actual learning process is contingent upon the nature and abilities of the learner, the motivations of the learner, the degree of similarity b/w the two or more lang.) in question and the kids of exposure to the language which are available. (Towell & Hawkins, 1994)

Scanned by CamScanner

Towell and Hawkins (1994) proposed five main questions addressing English as a second or foreign language:

1. **Transfer:** of grammatical properties from L1 mental grammar into the mental grammar that learners construct for L2.
2. **Staged Development:** L2 learners go through a series of 'transitional stages' towards the target language.
3. **Systematicity:** in the growth of L2 knowledge across learners.
4. **Variability:** in learners' intuitions about, and production of, the L2 at various stages of L2 development.
5. **Incompleteness:** most L2 learners do not achieve native-like competence. This phenomenon is referred as fossilization by Selinker (1972) and as incompleteness by Schacter (1990). (Towelland Hawkins, 1994, p. 15).

To Conclude: Towell & Hawkins model of SLA attempts to reconcile internal UG-derived hypothesis concerning the mechanism that functions during the processes of language learning and lang. use. It also explains the concepts of Declarative Knowledge and Procedural knowledge.

Scanned by CamScanner

Lesson 26 Comparing Six Theories-I

Topic: 90 :.. Theories Perspectives

Theories Perspectives

* Language learning
* Factors influencing learning
* Role of Memory
* Transfer occurrence
* Types of learning explained by a particular Theory
* Teaching paradigms

Language Learning

Theories	Perspectives
Behaviorist	learner as a 'blank slate' learning actually occurs through association b/w stimuli & responses.
Generativist	A nativist theory which asserts that much of the capacity for lang. learning in human is 'innat
Cognitivist	focuses on mental processes, including how people perceive, think, remember, learn, solve problems, and direct their attention to one stimulus rather than another.

Scanned by CamScanner

Constructivist	People construct their own understanding and knowledge of the world, through experiencing things and reflecting on those experiences
Monitor Model	Language acquisition does not require extensive use of conscious grammatical rules and does not require tedious drill
Socio-cultural	focuses on the importance of society and culture to shape and develop an individual.

Language Learning:

Perspectives vary as per the uniqueness of their domains and research covering:

- Behaviour
- innateness
- Mental processes
- Experiences
- Interaction
- Role of Society

Scanned by CamScanner

Theories	Perspectives
Behaviorist	Is primarily concerned with observable behavior, as opposed to internal events like thinking and emotion.
Generativist	humans are pre-programmed with the innate ability to develop language.' LAD : child's mastery of a native language in such a short time despite the highly abstract nature of the rules of language.
Cognitivist	*people are rational beings that require active participation in order to learn, and whose actions are a consequence of thinking. Changes in behavior are observed, but only as an indication of what is occurring in the learner's head.*
Constructivist	Integration of linguistic, psychological, and sociological paradigms. Context, construction and, collaboration are also seen as influencing factors.
Monitor Model	Advocates "Comprehensible Input," learners progress in their knowledge of the language when they comprehend language *input that is slightly more advanced than their current level*
Socio cultural	1.through interaction with others, 2. then integrated into the individual's mental structure

Scanned by CamScanner

To Conclude:

Behaviorism, Generativism, Coginitivism, Constructivism, Monitor Model and Socio-cultural theories are unique due to their distinct learning processes and factor that influence these learning processes.

Topic: 91: Role of Memory and Transfer occurrence

Theories Perspectives

Role of Memory:

- **Memory:** is the process by which we encode, store, and retrieve information.

Long-term memory is our brain's system for storing, managing, and retrieving information.

"Working" memory, info is kept in mind for shor-time before either dismissing it or transferring it to long-term memory.

Scanned by CamScanner

Role of Memory

Theories	Perspectives
Behaviorist	Advocates Classical Conditioning refutes existence of the mind or conciousness before, during and after conditioning
Generativist	No mere repitition, mental process extracts rules, applies and then creates new sentence
Cognitivist	Advocates study of mental process and involves sensation, perception, attention, encoding, and memory as its key principles
Constructivist	Humans construct knowledge and meaning from their experiences, involving the cognitive and social aspects of learning
Monitor-Model	Proposed distinction b/w acquisition and learning, learning involves formal instruction & acquisition is the acquirer is unaware of the process, as it happens. Also it does require extensive use of conscious grammatical rules, and does not require tedious drill.
Socio-Cultural	Advocates Zone of Proximal Development.

Scanned by CamScanner

Transfer Occurrence:

- Language transfer (also known as L1 interference, linguistic interference, and cross-linguistic influence) refers to applying of knowledge from one lang. to another lang.

Transfer Occurrence

Theories	Perspectives
Behaviorist	observing the behaviour of others (models), using the information (imitate) as a guide for our own behaviour, Reinforcement or punishment determines the behaviour.
Generativist	The indirect Access Model: Proposes the UG operates in L2 acquisition, but via the L1. the effects that particular L1 parameter settings may have on the way in which L2 learner develop the parameter settings of the L2.
Cognitivist	Cognitive development as a process which occurs due to biological maturation and interaction with the environment rather intelligence being a fixed trait.

Scanned by CamScanner

Constructivist	Proposed Building a new Schem Assimilation: was assimilate new info, changing our schemas to fit what we have learned accomodation: we accomodate new info, changing our memories to keep our schemas intact.
Monitor Model	The natural order hypothesis argues that the acquisition follows a natural order. learnin in predictable way occurs (both in L1 & L2) if the acquirers are given input they can comprehend, and are not under pressure.

To Conclude:

Behaviorism, Generativism, Cognitivism, Constructivism, Monitor-Model and Socio-Cultur theories vary with regard to role of memory and lang. transfer perspectives However, the generativist & cognitivist theories do share th role of memory whereas lang. transfer perspec -tives is observed in generativism to some extent.

Scanned by CamScanner

Lesson 27 Comparing Six Theories-II

Topic.92: Types of Learning

Learning is known as an act of acquiring or modifying new knowledge.

Learning is seen as a process whereby new knowledge is built on the previous knowledge.

* Declarative Knowledge
* Procedural Knowledge

Types of Learning

Theories	Perspectives
Behaviorist	(1) Learning through association-Classical Conditioning (2) Learning through Consequences-Operant Conditioning (3) ------ Observation-Modelling (observation)
Generativist	Generativism describes human lang. by means of generative Grammar. Chomsky proposes deep structure and surface structure. The rules expressing the relation of deep and surface structure are called "grammatical transformations"
Cognitivist	"Reasoning, clear objectives, problem solving" (Davis, 2008) "Across many minds and can draw on multiple knowledge bases and idea" (Ormrod,

Scanned by CamScanner

Monitor Model	Emphasizes the effective use of Monitor based on knowledge of r focus on correctness and time sp for monitoring.
Socio-Cultural	Emphasis on culture affecting Cognitive development, social factor Contributing to cognitive development role of lang in cognitive developm and adults are an important sou of cognitive development

Learning Domains

1. Learning is acquisition or "getting."
2. Learning is retention of information or skil
3. Retention implies storage system, memory Cognitive organization.
4. Learning involves active, conscious focus on and acting upon events outside or inside the organism.
5. Learning is relatively permanent but subje to forgetting.
6. Learning involves some form of practice, perhaps reinforced practice.

Learning is a change in behaviour (Broad

To conclude:

Types of learning best explained by Behaviorism, Generativism, Monitor-Model and Socio-Cultural theories represent the core

Scanned by CamScanner

concepts of each learning theory and broadly cover all the relevant learning domains.

Topic: 93:-- Classroom Application

Pinemann states: "it is important to know what is learnable at what point in time." (1995)

Theories application in classroom aims to address the issues of learner's needs and appropriate learning procedures to cater to those needs.

SLA research does offer a wide variety of concepts and data that can enable teachers reflect on their own classroom experiences, as well as provide ideas for classroom use.

Scanned by CamScanner

Classroom Application

Theories	Perspectives
Behaviorist	repetitive routines/lessons, drill/practice based activities, reward & punishment, utilizing stimulating activities, focus on reinforcement & desired behaviors, constant feedback to Sts .
Generativist	Generativism provides a set of rules, finite (i.e. limited) number of rules but will be capable of generating an infinite number of well-formed structures. explicit teaching, teachers present simple construction first before moving on to the more complex ones
Cognitivist	Activities to develop knowledge and skills from simple to complex (hierarchical learning) demonstrate learning outcomes in assignments, give problem-solving scenarios& real-life contexts for learning, assess changes in cognition
Constructivist	"Constructivist teaching involves students in collaborative groups, such as cooperative learning, reciprocal teaching, and long-term projects" (Jenkins, 2006, p. 3). "Children should have opportunities to engage in activities that closely resemble those they will encounter in the real world (authentic).Group learning to internalize cognitive acts.
Monitor Model	teaching techniques based on the concept of *comprehensive input* : knowledge given should be with precision & clarity, use graphical or visual aids, textbooks or supporting materials should be simple and appropriate,read aloud and paraphrase by students,
Socio-cultural	"reciprocal teaching," in reading session, teachers and students collaborate in learning and practicing four key skills: summarizing, questioning, clarifying, and predicting. "scaffolding" and "apprenticeship," in which a teacher or more advanced peer helps

Scanned by CamScanner

- Evolution process of learning relies on the successful application of its theories in real life situation.
- No straightforward solution to learning.
- Narrowed Domains in a particular theory can restrict understanding Relationship b/w teaching and learning determins the relevancy of a particular theory.

1. Methods based on the behaviorist theory of language learning lay emphasis on accuracy and form and do not allow errors.
2. Methods based on the interactionist theory give learners the opportunity for conversation where they receive meaningful input from teachers and students.
3. Methods based on the 'comprehensible input' theory, most closely associated with Stephen Krashen, do not put emphasis on interaction, but on providing input through listening and/or reading.
4. Methods based on teaching what the learner is ready to learn.
5. Methods that not only 'recognize the role for instruction, but also assume that not everything has to be taught' (Lightbown & Spada, 1993, p. 97).

To Conclude: Teaching and learning draw on the specific frameworks propagated by Behaviorism, Generativism, Monitor-Model and Socio-Cultural theories. Every frameworks despite constraints provides teachers and learners with opportunities to experiment different methods and to take into account the diverse learning styles in their classrooms.

Scanned by CamScanner

Lesson 28 Learning Factors-I

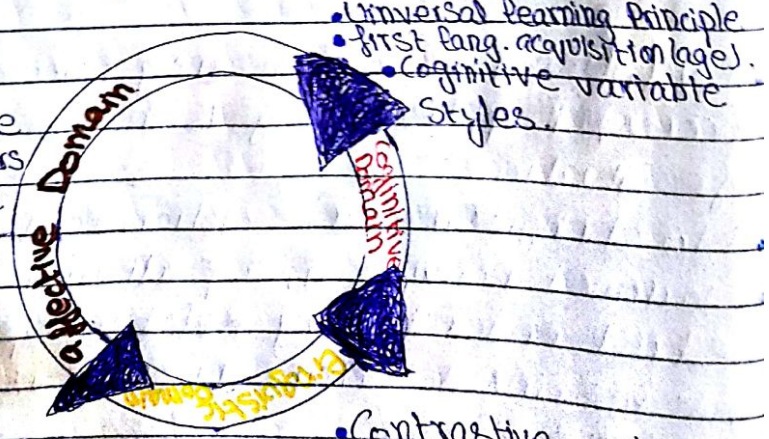
Topic:94: Language Learning Factors

The Study of SLA Covers:

Ranging from purely linguistic to cognitive models and social/interactionist models.

Comprehensive analysis of factors responsible for particular processes in a specific model. Nature of stages learners go through Pace at which learning takes place. The result or outcomes.

Framework for Second language Acquisition.



- Intrinsic Side affective factors
- Extrinsic Side socio-cultural variables.

- Universal learning Principle
- first lang. acquisition (age).
- Cognitive variable Styles.

- Contrastive analysis (interference)
- Error analysis (interlang.)
- Communicative competence

Scanned by CamScanner

Learning Factors: Internal:
Age, Personality, Motivation (intrinsic), Experience, Cognition, Native language
External:
Culture an status, Motivation (extrinsic), Access to native speakers, Curriculum, Instruction

External Factors

Culture and Status:
There is some evidence that students in situations where their own culture has a lower status than that of the culture in which they are learning the lang make slower progress.

Motivation (extrinsic):
Students who are given continuing, appropriate encouragement to learn by their teachers and parents will generally fare better than those who aren't.

Access to Native Speakers:
The opportunity to interact with native speakers both within and outside of the classroom is a significan advantage.

Curriculum:
For ESL students in particular it is important that the totality of their educational experience is appropriate for their needs.

Scanned by CamScanner

Instruction:

Clearly, Some language teachers are better than others at providing appropriate and effective ~~lang.~~ learning experiences for the students in their classrooms. These students will make faster progress.

The same applies to mainstream teachers in second lang. situations. The science teacher for example, who is aware that she too is responsible for the students' English lang. development, and makes certain accommodations, will contribute to their linguistic development.

Internal Factors:

Age:

Children, who already have solid literacy skills in the own lang. seem to be in the best position to acquire a new lang. ~~effectively~~ efficiently. Motivated, older ~~lang.~~ learners can be very successful too, but usually struggle to achieve native-speaker-equivalent pronunciation and intonation.

Personality:

Introverted or anxious learners usually make slower progress, particularly in the development of oral skills. More outgoing students will not worry about mistakes

Scanned by CamScanner

and practice.

Motivation (intrinsic):

Intrinsic motivation has been found to correlate strongly with educational achievement. Clearly, students who enjoy lang. learning and take pride in their progress will do better than those who don't.

Experiences:

Learners who have acquired general knowledge and experience are in a stronge ~~positition~~ position to develop a new lang. than those who haven't.

Cognition:

In general, it seems that students with greater cognitive abilities/intelligence will make the faster progress.

Native language:

Students who are learning a second lang which is from the same lang. family as their first lang. have, in general, a much easier task than those who aren't. So, for example, a Dutch child will learn English mo quickly than a Japanese child.

To conclude:

The external and internal learning factors contribute immensely in the overall

Scanned by CamScanner

understanding and forming of the appropriate approaches towards lang. teaching and learning processes.

Topic: 95: Age

Numerous researches have been conducted to trace the relations b/w the age and SLA.

Age has been observed as extremely important influence on lang. learning. Researchers like Ellis (2008), Larsen-Freeman (2008) and Mayberry and Lock (2003) state that younger learners are more successful in lang. study than aged ones.

Some adolescents or adults who start to learn second lang. would fail to achieve lang. fluency, while children who were exposed to second lang. at their early age seem to be proficient like native speaker (Cook, 1991)

Krashen (1979): The older is faster, but the young is better. Older learners can do it, but usually they should try hard to become a native-like speaker.

Scanned by CamScanner

Critical Period Hypothesis:

Lenneberg (1967), one of the pioneers of the researchess in the field of second lang acquisition, proposes the idea of Critical Period Hypothesis. That there is a certain period during which lang. acquisition is easy and natural.

Definition:

The period During which a child can acquire lang. easily, rapidly, perfectly and without instruction. (Richard and Schmidt, 2002).

learning lang. is an innate characteristic peculiar to all human beings and regulated by the biological factor and they determine the certain period which lasts from 2 years to puberty.

Lenneberg (1967) introduced the term "lateralization", a process when two sides of the brain develop special function. With the passage of time right hemisphere loses its lang. function and as soon as lateralization is finished by the age of puberty, lang. acquisition becomes too difficult.

According to Ellis in brief, the critical

Scanned by CamScanner

Period hypothesis is the notion that lang. is best learned during the early years of the childhood, and that after about the first dozen years of life, everyone faces certain constraints in the ability to pick up a new lang. (cited in Scovel).

Krashen (1979) investigated the matter and conclude that:

"Adults and older children come through stages of morphological and syntactic development quicker than children but early start or second lang. learning usually guarantees higher general lang proficiency with the flow of time"

Singleton (2004) claimed that

"Dutch learners who started learning English in the classroom after the age of twelve, were able to gain native-like accent"

- Research does identifies successful second lang. learners who started SLA after puberty and have been able to achieve native proficiency (Nikolo, 1994, 1995, Bongerts, Sommeren, Planken & Skills, 1997 cited in

Scanned by CamScanner

Moon and Nikolo, 2000)

- Herschensohn (2000) Newport (2001) present that older learners will make use of their first lang learning strategies to learn the grammar and achieve good performance than young learners.
- The importance of memory in young learners and of analytic abilities in older learners has been observed as the differences (Harley & Hart, 1997)
- Ekstrand (1978) describes: There is the age effects according to which older learner outscored younger ones can be explained by the teaching and testing techniques (cited in Lightbown & Spada, 1993)
- "The learning situation in combination with age-related affective and cognitive factor could account for some of the variation in success b/w child and adult L2 learning" (cited in Nikolov, 2000)
- "Adult/child differences in acquisition are due entirely to non-biological factors" (e.g. intensity of exposure, affective emotional process, motivation & instruction.)

(Snow, 2002)

Scanned by CamScanner

To Conclude:

Critical Period hypothesis theory states that early age is the best age for lang. acquisition and assumes that children will be the superior learner to lang. acquisition. However, there are specialists who doubt CPH and state that older learners show better results than the younger ones. Besides age, other age-related are cognitive, educational and social-psychological Factors that influence learning.

Topic:96: Motivation

"A phychological construct that refers to the desire and incentive that an individual has to engage in a specific activity." Hall (2011)

Loewen and Reinders (2011)

"It provides the primary impetus to initiate L2 learning and later the driving force to sustain the long and often tedious learning process." Dornyei (2005)

Three Views of Motivation

1. Behavioristic: This view of motivation deals with the factors like anticipation of reward, desire for positive reinforcement, and external individual forces in control.

2. Cognitive: Driven by basic human needs, degree of efforts expended, and internal individual forces in control are the factors considered in cognitive view of motivation.

3. Constructivist: Social context, community, social status, security of group, and internal and interactive forces in control are some of the factors, constructivists focus on, for studying motivation in learners.

Scanned by CamScanner

Dornyei's Process Model of Motivation

Stage	Functions	Influences
Preactional	• forming intentions • launching action.	• nature of the goal • value of the task • attitude to L2 & its speake • Self-efficacy • learner beliefs/strategies • available supports/obstacles
Actional	• 'Doing' • ongoing appraisal • Action control	• Quality of learning experience • Sense of autonomy • Teacher intervention • Classroom reward/goal structure • other learners • Self-regulation
Postactional	• Forming attributions • Elaborating strategies • Further planning	• Attribution Bias • Self-confidence / Self-worth • feedback, praise, grades.

Scanned by CamScanner

Dornyei's model presents three phases:

1. Setting goals and getting started
2. Keeping the motivation intact while carrying out the tasks.
3. Performance reflection

Integrative Motivation:

It is defined within the content of SLA, as an individuals desire to learn a lang. to integrate with the speakers of the target lang. to integrate with speakers of the target lang. as well as for cultural enrichment.

Instrumental Motivation:

It includes a group of factors that associate with motivation arising from external goals, for instance, passing exams or financial rewards.

Scanned by CamScanner

Learning Factors

GARDNER'S EDUCATIONAL MODEL

Gardner's schematic representation of the theoretical model

https://www.google.com/search?q=Gardner%27s+Model+of+Motivation&client=firefox-b-ab&source=lnms&tbm=isch&sa=X&ved=0ahUKEwir-M1_avWAhWD6YMKHfUmBFsQ_AUICigB&biw=1252&bih=602#imgrc=6ZpAnJ4d8IFTM

Scanned by CamScanner

To Conclude.

The internal factors (i.e. intrinsic / integrative) encourage and facilitate the process of lang. achievement and the external factors (i.e. extrinsic/instrumental) influence this process with effective contrib-utions.

Lesson 29 Learning Factors-II

Topic: 97:-- Relevant Learning Factors (Anthropological Evidence)

Background:

Critical Period Hypothesis (CPH). A biologically determined period of life beyond which time language is increasingly difficult to acquire. Initially CPH was concerned with L1. Recent researches focus on biological timetable & SLA: Critical point for SLA occurs around puberty, and that, beyond it, people seems to be relatively incapable of acquiring a second language.

Lateralization of the brain was thought to be a key to learning languages. As the

Scanned by CamScanner

human brain matures, certain functions are assigned, or "lateralized" to the left hemisphere of the brain (intellectual, logical and analytic functions) and certain other functions to the right hemisphere (emotional & social needs)

Language functions apper to be controlled mainly in the left hemisphere.

Eric Lenneberg (1967) and others sugge-sted that lateralization is a slow process that begins around the age of two and is completed around puberty.

During this time the child is neurologically assigning functions little by little to one side of the brain or the other; included in these functions, of course, is language.

Adams (1997) did a longitudinal study of a boy who at 8 years had no speech, underwent a left hemispherectomy, and then at the age of 9 suddenly began to speak.

Thomas Scovel (1969) proposed a relations-hip b/w Laterilization & SLA.

He suggested that the plasticity of the brain prior to puberty enables children to acquire not only their first lang. but also a second language and that possibly it is the

Scanned by CamScanner

process of lateralization that ~~main~~ makes it difficult for people to be able ever again to easily acquire it with an "authentic" (native-like) pronunciation.

"One must be careful to careful to distinguish b/w 'emergence' of lateralization (at birth, but quite evident at five) and 'completion' (only evident at about puberity)"

Sociobiological Critical Period (Scovel, 1988)

Refers to the development of a socially bonding accent at puberty, enabling species

(1) to form an identity;

(2) to attracts mates of "their own kind" in an instrinctive drive to maintain their own species.

(3) Scovell's conclusion is that there are "foreign" accents after puberty.

Some adults have been known to acquire an authentic accent in a second lang. after the age of puberty, but such individuals are few.

Anthropologist Evidence:

* Anthropologist Jane Hill (1970) provided a response to Scovel's (1969) study by citing anthropological research on non-Western

Scanned by CamScanner

Societies that yielded evidence that
★ Adults can, in the normal course of their lives, acquire second lang. perfectly.
★ SLA in adulthood was reported by Sorenson (1967), who studied the Turkanoculture of South America.
★ At least 24 languages were spoken among these communities, and each tribal group, identified by the lang. it speaks, is an exogamous unit (i.e. people must marry outside their group) and for this, they almost always marry someone who speaks another language.
★ Sorenson reported that during adolescence, individuals actively and almost suddenly began to speak two or three other lang. to which they had been exposed at some point.
★ Feild observation indicates that as a person approaches old age, he will go on to perfect his knowledge of all lang. available for him.
★ Flege (1987) and Morris & Gerstman (1986)... "cited motivation, affective variables, social factors and the quality of input as important in explaining the apparent advantages of the child."

Scanned by CamScanner

To Conclude:-

Much of the neurological argument centers on the time of lateralization. While Lenneberg argued that lateralization is complete around puberty, Scovel prefers distinguishing b/w 'emergence' of lateralization and completion.

Based on anthropological evidence, Sorenson claims that during adolescence, individuals can actively speak two or three other language to which they had been exposed at some point.

Topic:98: Relevant Learning Factors (Linguistics Considerations and Cognitive Ability).

Linguistic Consideration:

Research shows that the linguistic and cognitive processes of second lang. learning in children are in general similar to first lang. processes.

Adults, more cognitively secure, appear to operate from the solid foundation of the first lang. and thus manifest more interference.

However, they can't escape making errors.

Scanned by CamScanner

The first lang. can be facilitating factor, and not just an interfering factor

Factors for understanding linguistics consideration:-

1. Bilingualism
2. Interference b/w L1 and L2
3. Interference in Adults.
4. Order of Acquisition.

Bilingualism:-

- Children use similar strategies simultaneously learning two lang.
- They learn two first lang. and the key to success is in distinguishing seperate contexts for the two lang.
- Coordinate bilinguals and Compound bilinguals.
- Researches show considerable cognitive benefit of early childhood bilingualism, supporting Lambert's (1972) contention that bilingual children are more facile at concept formation and have a greater mental flexibility.

Interference b/w L1 and L2

- The linguistic and cognitive processes of L2 learning in young children are in general similar to first language
- Similar strategies and linguistic features are present in both first and second lang. learning in children

Scanned by CamScanner

Interference in Adults:

- L2 linguistic process are more vulnerable to the effect of the L1 on the L2 in adults.
- Saliency of interference from the first lang. does not imply that interference is the most relevant or most crucial factor in adult second lang.
- Adults, more cognitively secure and errors are considered as creative perception of L2 rules.

Order of Acquisition:

- Researchers claimed that transfer of L1 syntactic patterns rarely occurs in child second lang. acquisition.
- Children learning a SL use a creative construction process, just as they do in their first lang. Data about the acquisition order of eleven English morphemes in children learning SL supported this claim.
- Morpheme acquisition stages very similar for children within and across lang. in L1 acquisition, e.g. in English the order is

• Presents progressive	sitting
• Preposition	in, on
• Plural	chairs
• Past irregular	broke

Scanned by CamScanner

- Possessive — baby's
- Article — a car
- Past regular — wanted
- Third Person singular — eats
- Auxiliary be — She is coming ~~eating~~

Coginitive Ability

Refers to the ability to carry out any task from the simplest to the most complex. They have more to do with the mechanisms of how we learn, remember, problem-solve, and pay attention, rather than with any actual knowldge. (Brain Based Skills).

Scanned by CamScanner

Category	Definition	Related Behaviors
Knowledge	recalling or remembering something without necessarily understanding, using, or changing it	define, describe, identify, label, list, match, memorize, point to, recall, select, state
Comprehension	understanding something that has been communicated without necessarily relating it to anything else	alter, account for, annotate, calculate, change, convert, group, explain, generalize, give examples, infer, interpret, paraphrase, predict, review, summarize, translate
Application	using a general concept to solve problems in a particular situation, using learned material in new and concrete situations	apply, adopt, collect, construct, demonstrate, discover, illustrate, interview, make use of, manipulate, relate, show, solve, use
Analysis	breaking something down into its parts; may focus on identification of parts or analysis of relationships between parts, or recognition of organizational principles	analyze, compare, contrast, diagram, differentiate, dissect, distinguish, identify, illustrate, infer, outline, point out, select, separate, sort, subdivide
Synthesis	reading something new by putting parts of different ideas together to make a whole	blend, build, change, combine, compile, compose, conceive, create, design, formulate, generate, hypothesize, plan, predict, produce, reorder, revise, tell, write
Evaluation	judging the value of material or methods as they might be applied in a particular situation; judging with the use of definite criteria	accept, appraise, assess, arbitrate, award, choose, conclude, criticize, defend, evaluate, grade, judge, prioritize, recommend, referee, reject, select, support

Scanned by CamScanner

To Conclude:

The linguistic consideration in SLA refers to the understanding of bilingualism, interferance b/w L1 and L2 and adults, as well as the order of acquisition.

The cognitive ability also known as brain based skill to carry out a task from simple to complex levels.

Topic: 99: Relevant learning Factors (Cognitive and Affective Consideration).

Cognitive Consideration:

- Human cognition develops rapidly throughout the first 16 year of life and less rapidly thereafter.
- Some cognitive changes are critical; other are more gradual and difficult to detect.
- Jean Piaget (1972, 1955, 1969) outlined the course of intellectual development in a child through various stages.
- Ausubel (1964) Grammar in adults is easier because of the relevance of connection in cognition.

Scanned by CamScanner

- Jean Piaget Intellectual development stages:

- Sensorimotor Stage [birth to 2]

- Preoperational stage [ages 2to 7]

- Operational stage [ages 7 to 16]
  Concrete operational stage [ages 7 to 11]
  Formal operational stage [ages 11to 16]

- Ausubel (1964)
- Adults may in fact benefit from certain grammatical explanations and deductive thinking that would be pointless for a child.
- The benefits of such explanations however, depends on the suitability and efficiency of the explanation, the teacher, the context, and other pedagogical variables.
- Young children are generally not " Aware " that they are acquiring a language, nor are they aware of societal values and attitudes to one language or another.

Scanned by CamScanner

Affective Consideration:

- At the heart of all thought and meaning and action is emotion.
- Our emotions influence our thinking and actions.
- Important to develop understanding of the affective (emotional) domain in analyzing the differences b/w first and second lang. acquisition
- The affective domain includes many factors: empathy, self-esteem, extroversion, inhibition, imitation, anxiety, attitudes etc

Affective Considerations:

Affective domains:

- Empathy
- Self-esteem
- Extroversion
- inhibition
- imitation
- Anxiety
- Attitudes

Children → egocentricity
Adults → inhibitions.

oneself-identity is inextricably bound up with one's lang.

Younger children are less afraid because they are less aware of forms.

Peer Pressure → Adults tend to to tolerate linguistics differences more than children so errors as easily excused.

Scanned by CamScanner

To conclude:

The cognitive consideration include all intellectual thinking and affective considerations deal with expressions of feelings, attitudes, opinions and values.

30 Lesson — Language Learning Strategies-I

Topic:100 Direct Strategies Part-I

Learning Strategies:

"Learning strategies are specific actions taken by the learner to make learning easier, faster, more enjoyable, more self-directed, more effective, and more transferrable to new situations" (Oxford 199

LS "Special thoughts or behaviours that learners use to help them comprehend, retain and/or use information." Dansereau(19

"learners engage in activities to achieve certain goals, ... a choice of procedures. ... some form of long term planning."
(Stern 1992)

Rebecca Oxford (1990)

developed a lang. learning strategy system consists of Direct strategies and indirect strategies.

- Direct strategies are specefic ways that involve use of lang., sub-divided into memory (mnemonics), cognitive and compensation strategies.

- Indirect strategies do not directly involve using the lang. but support lang. learning (Ehrman & Oxford, 1990), and are further divided into metacognitive, affective, and social strategies, (Lee 2010)

- Rebecca Oxford (1990) developed a lang. learning strategy system consists of Direct strategies and indirect strategies.
- Direct strategies are specific ways that involve use of language, sub-divided into memory (mnemonics) (like a picture of something), cognitive and compensation strategies
- Indirect strategies do not directly involve using the lang. but support lang. learning (Ehrman and Oxford, 1990), and are further divided into metacognitive, affective,

Explanation

- Students were already familiar with concepts of implied main idea as well as major and minor details, as done in previous weeks. But this article was delivering new information; thus, students applied their existing knowledge to come up with correct answers. This displayed a use of meta-cognitive learning strategy.
- Based on this, students were asked to form an outline and write a paragraph on their understanding of the article. This helped students to develop a piece of work based on their existing knowledge and new knowledge by using cognitive learning strategy.
- In the third session, students were asked to form mnemonics in the form of abbreviation or images to memorize the content of the article.
- At the end of the activity, students were asked to give their feedback about the use of these strategies.
- According to students, it was very helpful for them to use their learned concepts on the article. This did not only help them in working practically on class content but also in memorizing the important incidents in the article.

To Conclude :- The Direct strategies involve the target lang. directly by enabling learners use mental strategies to make sense of their learning, creating mental linkage and overcoming knowldge gaps.
