

ENG507

→ Why Studying Phonetics and Phonology?

Studying phonetics and phonology is essential for understanding language sound systems. Phonetics examines sound production, while phonology explores sound patterns and distribution. This knowledge enhances language teaching, language acquisition, and speech therapy.

→ Evaluation Criteria for the Course

Evaluation criteria for phonetics and phonology courses include understanding phonetic transcription, identifying speech sounds, analyzing sound patterns, and applying phonological rules.

→ Introduction to Vowels and Consonants

Vowels are sounds made without obstructing airflow, while consonants involve obstruction. English vowels include monophthongs (pure vowels) and diphthongs (gliding vowels). Consonants encompass stops, fricatives, nasals, and approximants.

→ Introduction to English Vowels

English vowels include /i/, /ɪ/, /e/, /ɛ/, /æ/, /ɑ/, /ɔ/, /ʊ/, /u/, /y/. Vowel length and quality vary.

→ Introduction to English Diphthongs

English diphthongs include /ɔɪ/, /aɪ/, /aʊ/, /ɪə/, /ʊə/. Diphthongs combine two vowel qualities.

→ Introduction to English Consonants

English consonants encompass stops (/p/, /t/, /k/), fricatives (/f/, /v/, /s/), nasals (/m/, /n/, /ŋ/), and approximants (/w/, /j/, /h/).

→ IPA Transcription of English Sounds

The International Phonetic Alphabet (IPA) transcribes English sounds using unique symbols.

→ Introduction to Phonology

Phonology studies sound patterns and distribution in language.

➡ Introduction to Phonetics

Phonetics examines sound production, including articulation, acoustic properties, and auditory perception.

➡ Phonetics vs. Phonology

Phonetics focuses on sound production, while phonology explores sound patterns and distribution.

➡ Introduction to Key Concepts in Phonetics and Phonology

Key concepts include phonemes (distinct sounds), allophones (variant sounds), and phonetic transcription.

➡ Types of Phonetic Studies

Phonetic studies include articulatory, acoustic, auditory, and experimental phonetics.

➡ Articulatory Phonetics

Articulatory phonetics examines sound production, focusing on articulatory gestures and manners.

➡ Acoustic Phonetics

Acoustic phonetics analyzes sound waves.

➡ Auditory Phonetics

Auditory phonetics investigates sound perception.

➡ Experimental Phonetics and Phonology

Experimental phonetics and phonology employ empirical methods to study sound production and patterns.

➡ Generative Phonology

Generative phonology proposes rules to generate phonological patterns.

➡ Articulatory Phonetics: Speech Production

Speech production involves articulatory gestures, sound waves, and oro-nasal processes.

➡ **The Oro-Nasal Process**

The oro-nasal process distinguishes oral and nasal sounds.

➡ **Articulatory Gestures**

Articulatory gestures include stop, fricative, nasal, and approximant.

➡ **Manners of Articulation**

Manners of articulation encompass stop, fricative, nasal, and approximant.

➡ **Stop: Oral and Nasal**

Stops involve blocking airflow orally or nasally.

➡ **Fricative Approximants**

Fricatives involve partial obstruction, while approximants involve minimal obstruction.

➡ **Additional Consonantal Gestures**

Consonantal gestures include trills, taps, and flaps.

➡ **The Articulation of Vowel Sounds**

Vowel articulation involves tongue position, lip shape, and jaw movements

➡ **Suprasegmentals**

Suprasegmentals include stress, intonation, and rhythm.

➡ **Why Transcribe?**

Transcription aids language teaching, language acquisition, and speech therapy.

➡ **PHONEMIC AND PHONETIC**

Phonemic transcription represents distinct sounds, while phonetic transcription represents actual sounds.

➡ **Broad and Narrow Transcription**

Broad transcription focuses on phonemes, while narrow transcription includes allophones.

➡ IPA Resource: The North Wind and The Sun Story

The North Wind and The Sun story is a classic IPA transcription exercise. It demonstrates phonetic transcription using International Phonetic Alphabet (IPA) symbols, helping learners develop phonetic awareness and transcription skills.

➡ IPA Story: Explanation

This story explains IPA transcription principles, such as representing sounds, not letters. It highlights phonetic nuances like /θ/ (th) and /ŋ/ (ng), illustrating the importance of accurate transcription.

➡ IPA Story: Broad Transcription

Broad transcription focuses on phonemes (distinct sounds), using symbols like /p/, /t/, /k/. This transcription type emphasizes linguistic contrasts.

➡ IPA Story-Phonetic Transcription

Phonetic transcription represents actual sounds, including allophones (variant sounds). Symbols like [p^h], [t̚], [kʲ] capture phonetic details.

Transcription Beyond Words:

Transcription extends beyond words to capture connected speech phenomena.

Transcription Beyond Words: Word Stress

Word stress transcription indicates syllable emphasis, using symbols like /' / (primary stress) and /, / (secondary stress).

Transcription Beyond Words: Accent

Accent transcription represents regional or social variations in pronunciation.

Transcription Beyond Words: Phrases

Phrase transcription captures sound changes across word boundaries.

➡ The Consonants of English

English consonants include:

- Stop consonants (/p/, /t/, /k/)
- Fricatives (/f/, /v/, /s/)

- Affricates (/tʃ/, /dʒ/)
- Nasals (/m/, /n/, /ŋ/)
- Approximants (/w/, /j/, /h/)

Stop Consonants: Stop consonants involve blocking airflow orally or nasally.

- Fricatives: Fricatives involve partial obstruction.
- Affricates: Affricates combine stop and fricative characteristics.
- Nasals: Nasals involve airflow through the nasal cavity.
- Approximants: Approximants involve minimal obstruction

➡ Aspects of Connected Speech

Connected speech involves:

- Co-articulation
- Assimilation
- Elision
- Junction

➡ Co-articulation

Co-articulation occurs when sounds influence adjacent sounds.

➡ Introduction to Diacritics

Diacritics modify IPA symbols.

Diacritics and Detailed Transcription

Diacritics enhance transcription accuracy.

Aspiration

Aspiration involves releasing air.

Nasalization

Nasalization involves nasal cavity resonance.

Velarization

Velarization involves soft palate articulation.

➡ English Vowels

English vowels include monophthongs (pure vowels) and diphthongs (gliding vowels). Vowel quality, length, and pitch vary.

➡ Vowel Quality

Vowel quality refers to the unique characteristics of each vowel sound, determined by tongue position, lip shape, and jaw movement.

➡ Auditory Vowel Space

The auditory vowel space represents the acoustic properties of vowels, helping to distinguish between similar sounds.

➡ American and British Vowels

American and British English exhibit differences in vowel pronunciation, such as /æ/ in "cat" (American [æ] vs. British [ɑ]).

➡ Diphthongs

Diphthongs combine two vowel qualities, like /ɔɪ/ in "boy". Gliding vowels change quality during pronunciation.

➡ Rhotic Vowels

Rhotic vowels occur when vowels precede /r/, as in "car" or "far".

➡ Unstressed Syllables

Unstressed syllables have reduced vowel quality and pitch, often pronounced as schwa (/ə/).

➡ Tense and Lax Vowels

Tense vowels (e.g., /i/, /ε/) are longer and more closed, while lax vowels (e.g., /ɪ/, /ɛ/) are shorter and more open.

➡ Fortis and Lenis Consonants

Fortis consonants (e.g., /p/, /t/) are produced with greater force, while lenis consonants (e.g., /b/, /d/) are produced with less force.

➡ Rules for English Vowel Allophones

English vowel allophones follow patterns, such as:

- /i/ → [ɪ] in unstressed syllables

- /ε/ → [ɛ̃] before nasals

→ English Words and Sentences

Words in connected speech exhibit variations in stress, intonation, and rhythm.

→ Stress

Stress refers to the emphasis on syllables, with degrees of stress (primary, secondary, tertiary).

→ Degree of Stress

Degree of stress affects vowel quality, duration, and pitch.

→ Stress Explanation

Stress patterns help distinguish word meanings, as in "record" (noun) vs. "record" (verb).

→ Sentence Rhythm

Sentence rhythm results from stress patterns and intonation.

→ Intonation

Intonation refers to the rise and fall of pitch in sentences.

→ Target Tones

Target tones are the pitch levels aimed for in intonation.

→ Airstream Mechanisms

Airstream mechanisms produce sound:

- Pulmonic (lung air)
- Glottalic (vocal cord air)
- Velaric (soft palate air)

→ Pulmonic Airstream Mechanism

The pulmonic mechanism uses lung air to produce sounds.

→ Glottalic Airstream Mechanism

The glottalic mechanism uses vocal cord air to produce sounds, like /h/ or /ʔ/.

→ **Velaric Airstream Mechanism**

The velaric mechanism uses soft palate air to produce sounds, like clicks.

→ **Summary of the Airstream Mechanisms**

Airstream mechanisms generate sound through different air sources.

→ **Phonation**

Phonation refers to vocal cord vibration.

→ **Phonation Explanation**

Phonation types include:

- Voiced (vocal cords vibrate)
- Voiceless (vocal cords don't vibrate)

→ **States of the Glottis**

Glottis states include:

- Open (voiceless)
- Closed (voiced)
- Partially open (breathy voice)

→ **Phonation Types**

Phonation types include:

- Modal voice (normal voice)
- Breathy voice
- Creaky voice

→ **Voice Onset Time (VOT)**

VOT measures the time between consonant release and vocal cord vibration.

→ **VOT Explanation**

VOT distinguishes voiced and voiceless consonants.

➡ Importance of VOT

VOT affects speech perception and language acquisition.

➡ Types of VOT

VOT types include:

- Positive VOT (voiceless consonants)
- Negative VOT (voiced consonants)
- Zero VOT (simultaneous voicing)
