

Lec# 9-15

Lec# 9

Adolescence Conduct Disorder

- 5-15 to adolescents show occasional anti-social behavior (Meekes, 1980)
- Anti social behavior is displayed more in conduct disorders.
- Disregard feelings of others, bully smaller children, have few if any same age friends
- They are verbally abusive, negative
- They can manipulate people for favors
- Two patterns of behavior they show
 - ↓
 - Timid
 - Shy
 - feeling rejected
 - ↓
 - Less timid
 - more likely to exploit & manipulate others.
- Commit violation of basic rights by violence, robbery
 - ↳ Aggressive conduct disorder, socialized type
 - ↓
 - have the ability to develop friendship and to maintain it for 6 months or more.
 - Rebellious against authority

→ Greenling & De Blassie (1980)
↳ suicide is 2nd leading cause
of death among adolescents.

→ Miller (1975) causes of Adolescent
Suicide:

- i - Feeling of social isolation
- ii - Drug abuse
- iii - Depression
- iv - Alienation from society
- v - Stress due to strained
relationship with parents.

Runaways:

→ Nearly 1 million youngsters per
year runaway, equal no of boys & girls.

→ Jenkins & Stable (1972)

↓
they are unhappy, insecure, impulsive

→ Beyer (1974) → have low self-esteem

→ Baatonga (1975) → feel out of control

Why Do 1 million youngsters runaway
each year?

Reasons:

- i - Disturbed parent-child relationship
- ii - Problems in school
- iii - Need to search for adventure
- iv - Suffer boredom
- v - Family members are

Adolescence Suicide:

Life threatening behavior (LTB)

→ actions that are less lethal than suicide.

Weisman (1976) list of life threatening behaviors

- i - Non suicidal overdose of drugs, frequent alcohol abuse
- ii - Rash or bizarre acts, unskilled use of dangerous tools, they show poor judgment
- iii - Disregard professional and medical advice.
- iv - Gross overeating, starvation diets
- v - Rebellious against rules

→ Karl Menninger (1930s) → Man Against Himself (Book)

→ Suicide Ratio as per age

- 10-14 years → not leading cause of death
- 15-19 → 4th leading cause
- From 25,000 suicides 4,000 were committed by adolescents.
- In last 20 years adolescent suicide has increased by 250%

Conditions that warn of Adolescent suicide

- i - Heavy drug use
- ii - Rejection by father
- iii - Verbal statements about the absence of hope & meaning in life
- iv - Major failures in family, studies etc.
- v - coping with physical disability

- majority of them come back home after troubles.
- Some states consider it a crime, and may be forced to see a counselor.

Identity Disorder of Adolescents

- i- Who I am?
- ii- What am I going to do with my life?
- iii- By what values should I live?

Reality therapy → William Glasser
↓ Book

The identity society
↳ deals with identity issues.

- He said youngsters of nowadays no longer strive for goals as those in past generations had.
- Today goals are thought of after roles.
- Everyone is striving for acceptance rather than performing a task
- It is not Who we are that is imp now for many but what we do for a living.
- DSM-III says a problem may become chronic if he is unable to establish a career commitment, lasting relationship, emotional attachments & interpersonal relationship.
- Formal Operational thought → Piaget
↳ during adolescence, dealing with abstract problems & form hypothesis.
- It is highest stage of cognitive development.

Value System of Adolescents:

↳ they develop their own values

Friendenberg (1954)

↳ pressure of conformity with peers overwhelm them and prevent the full development of their values.

Sorensen (1973) → 86 % of them felt that they did have their own personal values, though not many are satisfied by the way they are putting them to use.

Robert Kastenbaum → suggested to integrate one's preferred values into an overall system.

Adolescents values generally center on:

- i- Selection of Friends → selects on the basis of their intellectual & emotional capacity
→ become inclined to make friends with opposite sex
- ii- Social Judgment → they have values concerning acceptable or unacceptable members of d/f groups like gangs etc
- iii- Leader → They have their own ideas about the qualities of a leader.
- iv- Sex
↓
develop certain sexual values which determine their behavior towards opposite sex.

It is influenced by peers, media, cinema

Career Choice Development in Adolescence

↳ Adolescents who have economic or social disadvantage are not aware of the full range of career possibilities because of their limited interaction so they limit their aspirations

↑ Laska & Mcelin (1979) →

→ Not everyone reaches the stage of formal operations by adolescence.
→ Children learn the ability to generalize before the age of eleven, but they do not understand abstract characteristics.

↓
By the age of 15 they can

→ Ability to deal with symbols also develop in formal operational, like algebra.

→ (Weiner, 1977) → Adolescent challenge adult decisions and want to know the reason behind them, also they do not accept a decision of their peers without a question.

↓
↓
→ they can challenge religious & social values too.

→ Adolescents are also freed from the bonds of personal experience & present time to explore ideas, roles, beliefs

↑ Neimark (1975) ↑

→ Adolescents caught up in idealism often place their ideals before family values.

Adolescent Egocentrism

↓
Characteristics of preoperational thought.

→ In infancy they do not know they have a point of view but at adolescence they search to know who they are, become self-absorbed, take into account others' thought but think that their thoughts are directed at them.

Ginberg (1951) three stages of adolescents career planning :

- i - Fantasy period → elementary school choices are not realistic, decisions are emotional, not practical.
- ii - Tentative " → at puberty have somewhat more realistic interests
- iii - Realistic " → can plan for appropriate education to meet their career requirements.

- Many young people are still not realistic in late adolescence.
- One's self concept influence one's career choice.

Delinquency among adolescence :

- They are more likely to face legal problems & indulge in criminal acts as compared to children.

Vandalism → destruction of public & private property

- Violence & Vandalism is found in them.
- Most delinquent activities are done by groups rather than singly.

Where do delinquents come from

- i - from home broken by divorce
- ii - deficient socialization & inadequate parenting

iii- Peer relation has greater influence than parental on participation in delinquency

→ Vandalism can be done for entertainment

→ Shop lifting is also this behavior.

(Loeber & Dishion 1983)

→ Stealing, lying, poor achievement in school are all imp predictors of delinquency.

Two types of Juvenile delinquency:

↓
Status-Offender

↓
A young person who is a runaway has been sexually active and has not abided by parents rules and has done something that is not criminal when done by a minor.

↓
Who has done a crime like robbery, rape, murder.

Adolescents Relationship with Parents

→ Young people feel a constant tension b/w needing to break away with their parents & realizing how much they are dependant on them.

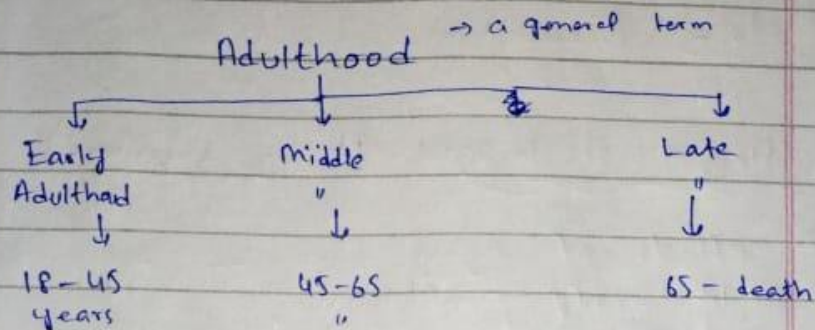

(Steinberg 1981-1987)

→ Contact is more likely to surface b/w adolescents & their mothers than their fathers.

Because they have been close from there mothers.

White growth trends

- i - Stabilization of ego identity
- ii - freezing of personal relationship
- iii - deepening of interest
- iv - humanizing of values
- v - expansion of caring.

Characteristics of early Adulthood

- i - period of adjustment to new social expectations, pattern of life.
- ii - A setting down stage which involves finding economic stability & stable marriage partner.
- iii - Reproductive age
- iv - Most women of 23-29 marry & conceive in this period.
- v - A period of change of values
- vi - Stage of individualism
- vii - Spend time in pursuit of intellectual tasks.

(Steinberg 1988) → Increased conflict in early adolescence may be due to puberty rather than chronological age & some research suggest it can be bi-directed.

→ Adolescents are likely to reject parents values and accept peer values.

Lect# 10

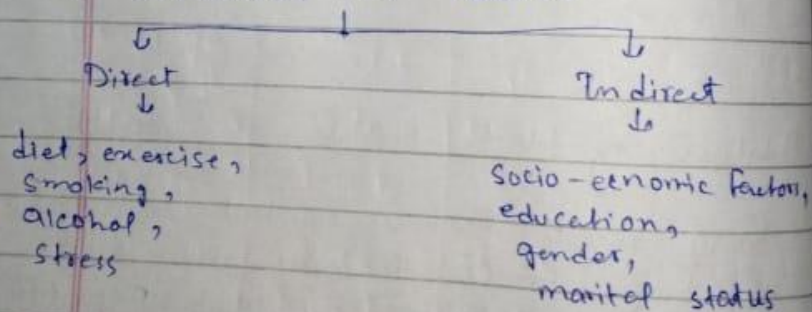

Early Adulthood

21 year onwards. → Adulthood

Early Adulthood → 18-45 onwards.

→ Both physiology & biologically a person is at its peak.

→ Influences on health

Theoretical Approaches

- i- Piaget
- ii- Warner Schaie
- iii- Steinberg

Developmental tasks of early adulthood

- i - Selecting a mate
- ii - Leaving to live with a marriage partner.
- iii - Starting a family.
- iv - Managing a home.
- v - Occupation

Weight & height (Early Adulthood)

effects of aging can be seen in early adulthood.

→ most prominent is height & weight changes that occur b/w 18 - 45 years.

→ (Abraham 1979)

Average weight	Gender	Age	Increment
172 pounds	Male	18-74	
143 lbs	Female	18-74	
	Male	35-45	165 → 178 lbs
	Female	35-45	132 - 149

→ Black men/women have more weight than white.

Timmons → cause of weight gain is age related fat deposition in body

Mean height	Gender	Age	Decrement
<u>5 ft, 9 in</u> 69 in	Male	18-74	
<u>5 ft, 4 in</u> 65.3 in	Female	18-74	
	Male	35-45	69.7 → 69
	Female	35-45	65.3 - 64.1

Timiras (1972) → these slight decrease in height is due to a setting of the spinal column and to the steady decrease in the density of the long bones of the body.

The eyes:

Accommodation

↳ adjustments made by the eyes for seeing things at diff dis or focusing properly, quickly.

Allen (1956) → there is a gradual loss of quickness of eyes at 45 years of age.

Acuity → sharpness of vision → At its peak in early adulthood.

Roberts & Rowland → Males have better avg eyesight.

Muscular Strength

↳ peak occurs at 20-30 years
→ ~~muscle strength is contrasted with~~
work rates.

Shock &
Nonis

power output decrease after the age of 40 and decrease considerably during middle adulthood.

Teeth : → Most people retain all their permanent teeth in early adulthood.

Kelly & Harvey → Small portion loose their upper or lower teeth.

→ Loss of teeth is more likely to occur to women than men.

→ Periodical disease : Inflammation of gums & bone tissues surrounding teeth which results from poor dental hygiene.
↓
probability to get also increase in early adulthood

Heart : It becomes sluggish as we age
↓
in its ability to pump blood efficiently.

→ that is why people can't sustain large work load as they grow older.

The Lungs : → young adults absorb 4-5 times much oxygen as an older adult.

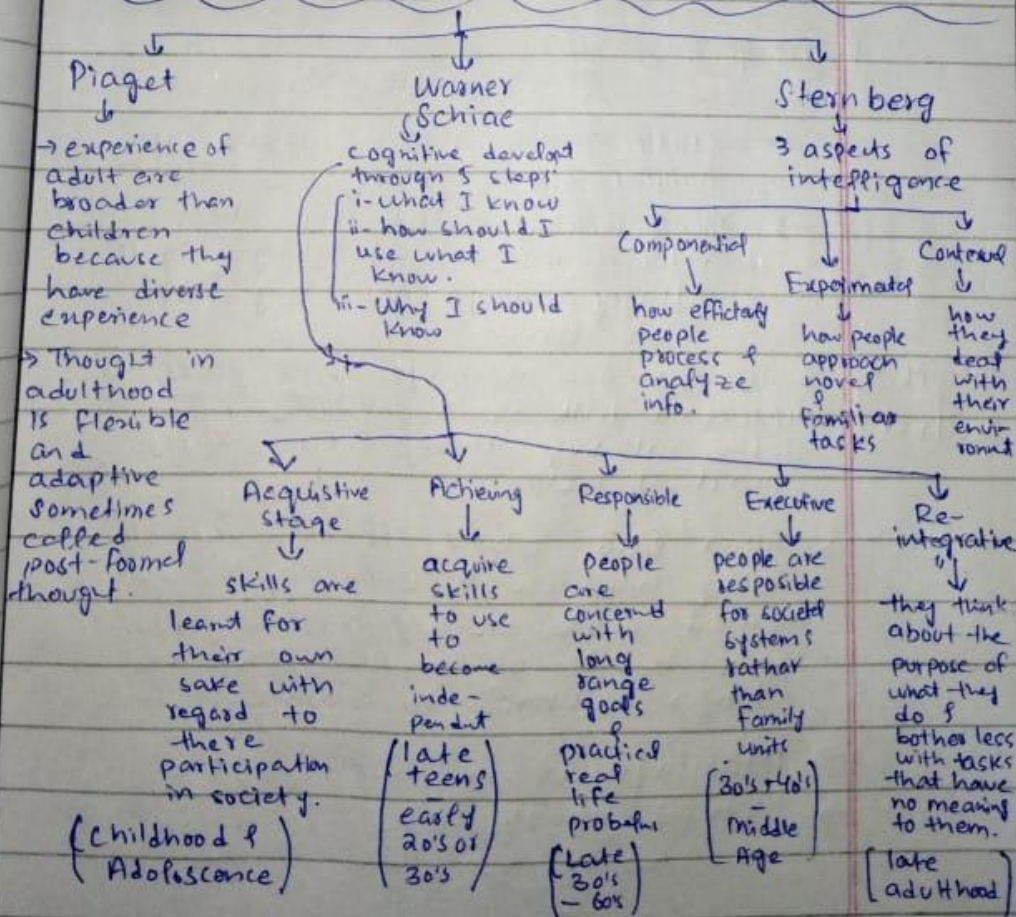

(Timiras 19720)

→ decline in oxygen absorption partially can be traced to lowering of the amount of blood pumped through the lungs as well as to losses in the mechanical efficiency of the lungs as people grow older.

The Skin : → wrinkles on facial area, particularly around the eyes (crow's feet) & on the hands.

→ skin loses its fine texture

Theoretical Approaches Concerning Adult thought

Adult Maturity: ~~Def~~ A state that promotes physical & psychological well being.

→ mature person possess a well developed value system, accurate self concept, stable emotional behavior.

→ As per white (1960) maturity implies ability to cope more successfully with life's problems, expanding resources for happiness.

Allport's Seven dimension of Maturity

- maturity is an ongoing process
- 7 dimensions that manifest themselves during adulthood.

Marriage → most many 1st time in young adulthood

→ Studies shows married people are happier than singles

→ Young wives reported less stress after marriage while young husbands although happy said they felt more stress.

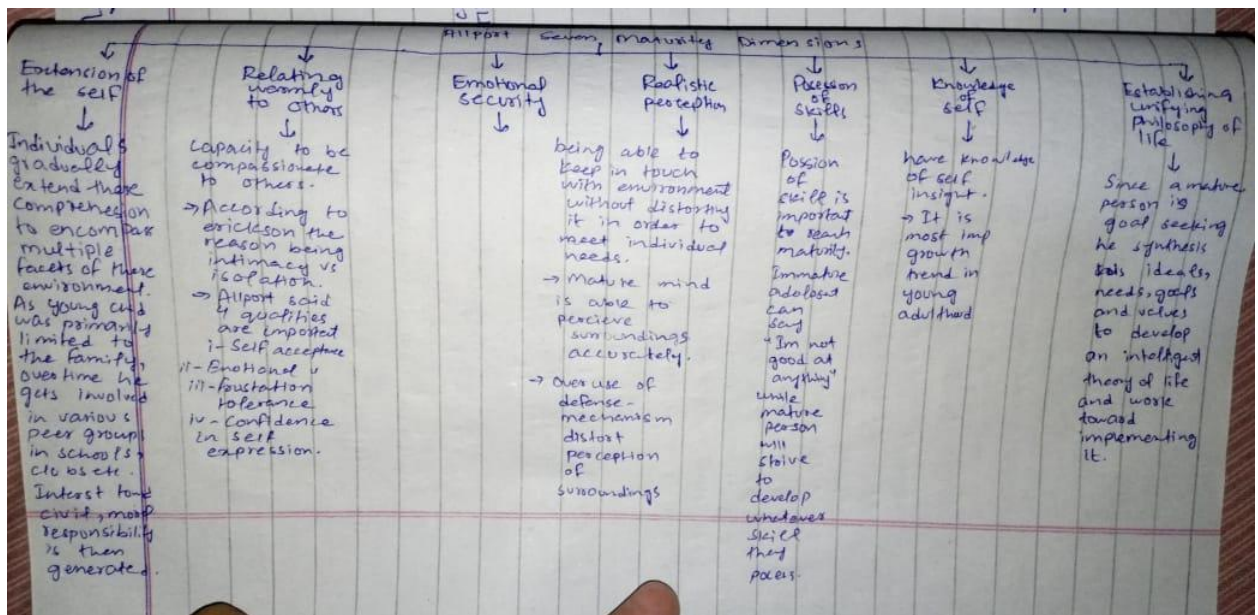

Thompson & Walker

→ Women see marriage as a place to express & talk about emotions men define intimacy through sex, giving practical help.

→ Glenn said ability of marriage to bring happiness is changing. Never married people are happier today because some benefits of marriage are no longer confirmed to wedlock.

→ Marriage is a healthy state.

→ Married people have fewer disabilities or chronic conditions.

Characteristics that enable adapt well to marriage are :

- i - Self control
- ii - Self disclosure
- iii - Ability to demonstrate affection
- iv - " handle Frustration & anger
- v - Flexibility

Happy marriage requirements for men

- i - high socio-economic condition
- ii - education level
- iii - fulfilling husband's role

Love : emotional state involving attraction, sexual desire & concern about another person.

Passionate love : an intense and unrealistic emotional response to another person, the lover wants to spend time with the loved as much as possible.

↓
great concern of discussion and research.

→ topic of literature, cinema.

Occupational development of Young Adulthood

→ In 1960 a consensus was taken and it was known by that people think that 20-23 years is the best age to finish one's education and go to work.

24-25 years were expected to settle on a career.

Supers' five stages of occupational development

- i- Crystallization of one's ideas about work
- ii- Specification of particular occupational preference.
- iii- Implementation of training
- iv- Stabilization
- v- Advancement within a field

→ Lievinson said it is a cruel ~~method~~ myth that at the end of adolescence you choose your career, settle down and continue.

→ If a significant start is not taken by the age of 34 chances are small that a man will find a satisfactory life-structure with an occupation consistent with his identity.

Lect 11

Divorce

() most people divorce during 7th year of married life.

→ About 2 out of 3 first marriages end up in divorce.

Hunt & Hunt → typical divorced person is
b/w 30-33 when divorce becomes final
and lives in a city and have one
child.

[Click 1975] → Divorce rate is higher among poor,
poorly educated and working class

→ Click & Norton → Divorced people have
married earlier.

↓
people married in teens have
a high probability of divorce.

Hunt & Hunt identified three scenarios

- i - marriage simply fades away without awareness
- ii - a job offer in another town.
- iii - Cheating
- iv - Most divorce take place after a prolonged conflict.

→ Divorced person can get identity crises.

25% divorce → because of low standard
women of living.

→ 2/3 remarry within 3 years of divorce.

→ 1/2 remarried within 9 years.

→ Men tend to remarry sooner.

→ Midlife transition around 40-45

Middle Adulthood

→ Men show average decrease while women average increase in weight

Changes in skin tissue:

→ Skin becomes drier and feels rough to touch, it loses its elasticity so the wrinkles appear, particularly on neck, face, hands.

Changes in eyes & ears:

→ Accommodation → focusing ability of eyes
→ gradual loss in middle ages

(Depigmentation of the iris, loss of retinal reflexes, changes in lens of cornea)

→ cataracts is a cloudy area in the lens of eye that helps to focus light.

Common as we get older. (Surgery is needed)

→ Glaucoma is the increased pressure from within the eye ball, it damages optic nerve and cause blindness.

→ can be controlled by medicine in middle ages.

Teeth: Osteoporosis: leading cause of tooth loss in middle and late Adulthood.

↓
bone tissue around teeth becomes more porous and teeth become loose in the socket and eventually fall out.

Changes in Skeletal System

Arthritis : Inflammation of joint, pain & change in structure of joint.

Rheumatism : variety of pain in joints.

Circulatory System :

→ Three basic changes

↓
Decline in elasticity of the arteries

↓
Accumulation of fatty deposits in arterial tissues

↓
decline in the pumping ability of heart muscle

Atherosclerosis → hardening of the arteries

→ normal part of aging.

→ calcium salts, fats, cholesterol become congested in the artery walls.

→ Hypertension → Blood pressure increase throughout the body.

↓
aging process of heart muscle is quickened.

→ Longs elasticity shows signs of loss in middle ages.

Digestive system

→ Fewer signs of aging

Disturbances in middle ages includes

i - Intestinal obstruction

ii - Absorption problems

iii - Gall stones

iv - Ulcers

} → due to environmental conditions.

→ Diabetes → inability of body to metabolize sugars and use them in cells.

→ Failure of pancreas cells to secrete adequate amount of insulin which digest sugar.

Reproductive system:

→ Changes in it are hormonal in nature.

→ much more evident in women

→ At 40 women begin irregular menstrual cycles.

→ Menopause → ending of ovulation

↳ 45-55 years.

→ Uterus weight decrease by 53% b/w 30-50 years.

→ Wall of vagina become thinner lubrication diminish during sexual excitement.

Sensory & Motor Capacity in Middle Age

↳ Fairly small changes

Presbyopia → gradual loss of eyes to focus on nearby objects

↓
can happen in middle ages.

→ At 55 years, hear loss
greater in men

→ Taste sensitivity begin to decline at 50 years

Health Problems in Middle Ages

Average individual is generally healthy.

↳ Most common problems are

↳ asthma, bronchitis, mental disorders, arthritis etc.

→ Hypertension → 1 out of 5 adults

→ Aids → over age 50 then in children age 13.

→ Intelligence may increase slightly in middle ages.

↳ Men slight gain
Female " decline.

→ successful achievement oriented men
least likely to remain single.

Widowhood & Middle Age

- applied to both male & females
- women are most likely to become first

Alternatives available to woman widowhood

- Remarriage
- Retraining for jobs
- participation in voluntary organizations
- devoting time as mother or grandmother

Lopata needs of widows

- Expressing grief
- Meeting companionship needs
- Providing assistance.

Lopata three patterns of Adjustment to widowhood

- built new life style
- Do not look back at past
- Do not become socially isolated.

Two outcomes

↓
Stable Pattern
↓

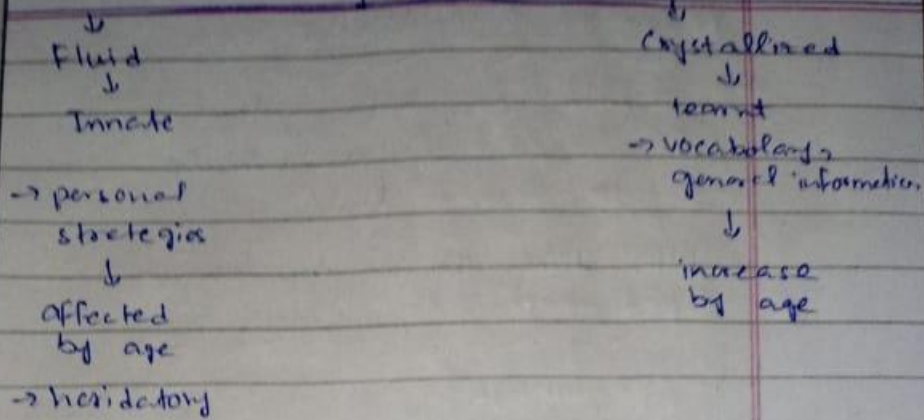

People who
stable can
reaping
benefits
letting
to benefit
from the
experience

→ Many repositions
power &
responsibility

↓
Workaholics
↓

may work at
pressured space
to achieve
financial security

Intelligence

Marital Satisfaction in middle life

- Follow a U shaped curve.
- Form an early high point, declines until late middle age then rise again.

Lect 12

Singlehood & Middle Life

- St. App people in US never marry.
- have intense career commitment
- most single people form strong relationship with their friends, singles or married.
- homosexual mostly never choose to marry.
- Older women choose not to marry rather than having never been asked.

Two occupational patterns in Middle Adulthood

↓
Stable
Pattern
↓

People who follow stable career are reaping personal benefits and letting society to benefit from their experience

→ Many reach positions of power & responsibility

↓
Workaholics
↓

may work at frenzied pace to achieve financial security

Mellowed
↓
comes to term with their level of achievement

↓
Changing
career
↓

realize they do not want to do what they are doing for another 20 years.

Self Actualization in Middle "

→ Abraham Maslow

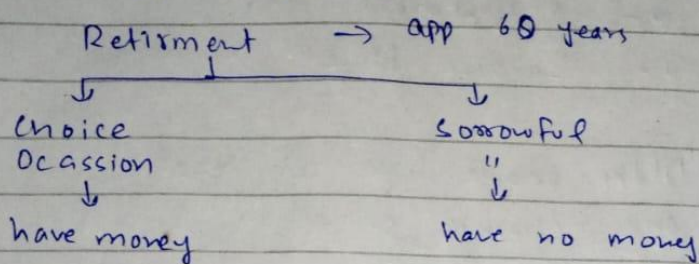

→ not attained until middle adulthood

→ use their capabilities to fullest

reserve capacity → ability of organs to give 4-10 times much effort for extraordinary circumstances.

Lec #13

Late Adulthood

Stages of Retirement

- i- Pre-Retirement
- ii- Honey moon period → After retirement
- iii- Reorientation phase → start working again
- iv- Stability phase → how you can live with changes after retirement
- v- Termination → very old, can't do work

Remarry Divorce in Late Adulthood

very rare
→ if divorced do not remarry.

Development task

- i- To attain ego-integrity & avoid ego despair → satisfied with life → Erickson
- ii- Facing death → peaceful when attained ego integrity
- iii- Adjustment to retirement → successful when ego integrity is "
- iv- Disengagement → disconnected with people in old age
- v- Overcome depression

Problems of Old age

- i - Physical problem
- ii - Economic "
- iii - Social "
- iv - Adjustment "
- v - Leisure time "

Older people have at least
one chronic condition

- i - Arthritis - 48%
- ii - Hypertension - 37%
- iii - Heart disease - 30%
- iv - Cataract - 16%
- v - Hearing impaired - 30%
- vi - Leg, hip, back, spine - 17%
Impairment

→ Learning is slow in them

Personality Development in Late Adulthood

- i - Erickson → wisdom develops
- ii - Robert Peck →
 - i - they should refine their worth
 - ii - health satisfaction is lost
 - iii - Acceptance that his life is ending

iii - George Va

Research on

↳ doing ab
late a
catis fi

→ Aging speed

Pattern

Integrated

↓
functioned
well in
earlier
years

they can
get
satisfaction
from
multiple
ways

Lect#15

→ people

Types:

Maslow traits of self actualizers:

- i - More efficient perception of reality
- ii - Acceptance of self & others
- iii - Spontaneity
- iv - Problem centering
- v - Detachment → need solitude
- vi - Appreciative → to nature & life
- vii - Mystic experience
- viii - Unique interpersonal → have fewer friends but good relation with them
- ix - Discrimination b/w means and end
- x - Philosophical sense of humor

Late Adulthood

- report shortness of breath after excessive movement
- reduction of gastric juices
- frequent intestinal complaints
- loss of efficient sensory system
- i - Visual problems
- ii - Hearing "
- iii - Taste & Smell "
- iv - Decline in coordination & reaction time
- v - " in general functioning

Aspects of Death:

- i- Biological → heart stops, neural activity stops
- ii- Social → how to phase death like what to do with deceased.
- iii- Psychological → those whom elosed one dies thinks about their & others death.

Psychological Changes of Death

- i- Less energy level
- ii- Rigol said intellectul level drop before 5 years of death.
- iii- Start reviewing life's experiences.

Childhood: 5-7 years → postmanant
↳ death is temporary state

Adolescence: → death as fantasy
→ not afraid of it

wants to live ←

Young Adulthood: → death is frustrating

Middle " → do not accept

Steps of

- i- De
- ii- Ar
- iii- Bo
- iv- E
- v- U

Grief +

Controvers

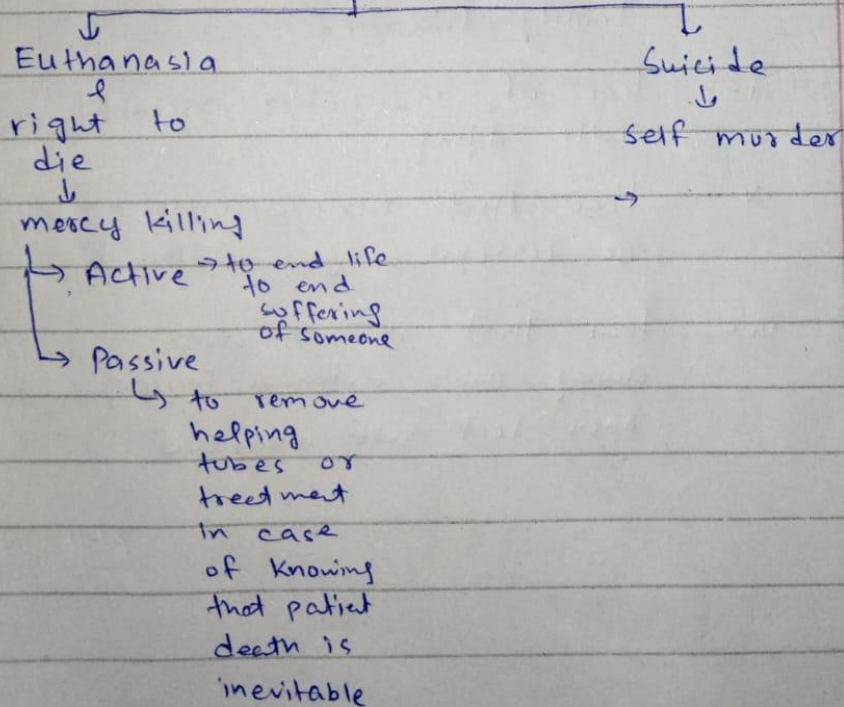

↓
Euthanasia
&
right to die
↓
mercy kill
↳ Active
↳ Passive

Steps of death

- i - Denial
- ii - Anger → why me
- iii - Bargaining for extra time
- iv - Depression → hospitalized
- v - Ultimate acceptance

Grief therapy : help bereaved cope with their losses.

Controversial issues of death & dying

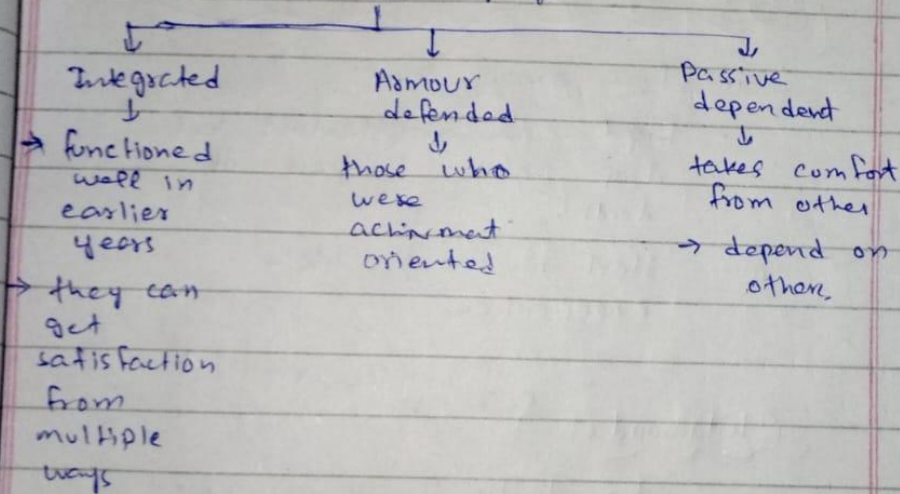

iii - George Vaillant → stop blaming

Research on change of Personality

↳ drug abuse in early life make late adulthood individual not satisfied.

→ Aging speeds up after adulthood

Pattern of aging

Lec#15

Death (thanatology)

↓
study of death

→ people should prepare themselves for death

Types:

- i - Clinical → heart or respiration stops
- ii - Brain → brain has no oxygen for 4-6 minutes.
- iii - Cellular → organ death

→ Coandall

↳ Old people do not fear death because they have achieved

Young people are afraid of life.

Coandall list of fear of death

i - Fear of what happens after death.

ii - Fear of painful death

iii - Fear of dying will drain family finances

iv - Fear of indignities associated with dying

v - Fear that no one will care or remember you after it

vi - Fear that it will strip away one's defences leaving one's real self exposed
