Question No : 46 of 52
Marks: 3 (Budgeted Time 6 Min)
Identify the given statement as correct or incorrect and justify your answer in either case.
"One-way Clustering gives a local view whereas Two-way Clustering gives a global view".
Answer (Please click here to Add Answer)
PAGE 271
1. One-way Clustering-means that when you clustered a data matrix, you used all the attributes. In this technique a similarity matrix is constructed, and then clustering is performed on rows. A cluster also exists in the data matrix for each corresponding cluster in the similarity matrix.
2. Two-way Clustering/Biclustering-here rows and columns are simultaneously clustered. No any sort of similarity or dissimilarity matrix is constructed. Biclustering gives a local view of your data set while one-way clustering gives a global view. It is possible that you first take global view of your data by performing one-way clustering and if any cluster of interest is found then you perform two-way clustering to get more details. Thus both the methods complement each other.

Question No : 47 of 52
Marks: 3 (Budgeted Time 6 Min)
We can identify the Session in Word Wide Web by using "Time-contiguous Log Entries" however there are some limitations of this technique. Briefly explain any two limitations.
Answer (Please click here to Add Answer)
PAGE 365
Limitations
• This method breaks down for visitors from large ISPs because different visitors may reuse dynamically assigned IP addresses over a brief time period.
• Different IP addresses may be used within the same session for the same visitor.
• This approach also presents problems when dealing with browsers that are behind some firewalls.
Notwithstanding these problems, many commercial log analysis products use this method of session tracking, which requires no cookies or special Web server features.

Question No : 50 of 52
Marks: 5 (Budgeted Time 10 Min)
Identify the given statements as correct or incorrect and justify your answer in either case.
1. "Median is an example of Distributive Aggregate".
2. "With the help of "current value field" method we can track as many changes as we wish".
Answer (Please click here to Add Answer)
1 statement wrong
holistic:
Require unbounded amount of information about eachsubgroup
Examples: MEDIAN, COUNT DISTINCT
Usually impractical for a data warehouses!
2nd statement wrong
we can track only recent 2 changes in current value field
statement which gives refer to preserve history
in which this statement is true but for current value field it is wrong

Question No : 51 of 52
Marks: 5 (Budgeted Time 10 Min)
What is clustering? How it can be used in Telecom Industry for targeted sale promotion?
please pray for
everyone <3
Answer (Please click here to Add Answer)
Clustering: Identify outlier records using clustering based on Euclidian (or other) distance. Existing clustering algorithms provide little support for identifying outliers. However, in some cases clustering the entire record space can reveal outliers that are not identified at the field level inspection. The main drawback of this method is computational time. The clustering algorithms have high computational complexity. For large record spaces and large number of records, the run time of the clustering algorithms is prohibitive.
PAGE 164 and 236
Cluster Index: Concept
A Cluster index defines the sort order on the base table.
Ordering may be strictly enforced (guaranteed) or opportunistically maintained.
At most one cluster index defined per table.
Cluster index may include one or multiple columns.
Reduced I/O.
