

MCQs:

- 1) Andrabi, Das and Ijaz (2002) argued that parents infer **quality variation** between schools through the range of fees which varies in predictable ways to measured school inputs.
- 2) more than a **billion** children are in primary or secondary school.
- 3) School gardens in terms of the **kitchen garden**, if the school that have ground space can develop school gardens where they grow vegetable.
- 4) Technology is a **trend** because everyone is Using it, and we need to use it in education.
- 5) recurrent expenditure amounted to about Rs. **12 billion** in the year preceding the Census.
- 6) {Rest MCQs were from my file **(EDU401 Finals Objective by Nimma Malik (2K26))**}

Subjective:

Short Questions:

by private owners instead of the government. These schools usually charge fees, so only families who can afford them can send their children there.

When education is privatized too much, common schooling becomes weak because students are divided based on money. This can increase inequality in society. Common schooling supports equal education, while privatization often creates differences in quality and access.

According to Eraut, what are the features of Formal learning?

- 1) A prescribed learning framework
- 2) An organized learning event or package
- 3) The presence of a designated teacher or trainer
- 4) The award of a qualification or credit
- 5) The external specification of outcomes

In a community facing water scarcity, environmental education should focus on water conservation, rainwater harvesting, and efficient water use. When students study and practice these local solutions, they can immediately apply what they learn to improve conditions in their own area. This local understanding later helps them understand wider global water issues as well.

Financing Private Education in Pakistan?

Private education in Pakistan is mainly financed through fees paid by parents. Most private schools and colleges depend on monthly or annual tuition fees for their expenses. Some institutions offer installment plans to make fees affordable. Scholarships and fee concessions are given to deserving or talented students. In addition, NGOs and foundations provide financial support or interest-free loans. Government support is limited, but some private schools reserve free or low-fee seats for needy students

The browser's address bar shows the file path: "D:/EDU401%20Finals%20Compilations%20BY%20NIMMA%20MALIK%20(2K26)%20%20%20-%20.pdf". The browser's toolbar includes various icons for navigation and search. The document content includes a title, a paragraph explaining the link between population studies and other fields, and a list of structural changes.

What is the link of population studies with other studies?

Population studies are connected to many other fields because population affects almost every part of society. In economics, population influences jobs, income, and the use of resources. In health and medicine, population size affects healthcare services, disease control, and nutrition. In sociology, it helps us understand family structures, migration, and social behavior. Population also affects education by determining school planning, literacy rates, and learning needs. It impacts the environment through resource use and pollution, and it affects politics by influencing government planning and policies. In short, population studies are closely linked with economics, health, society, education, environment, and politics.

- Structural changes

Long Questions:

Student Adjustment-Mitigation Strategy?

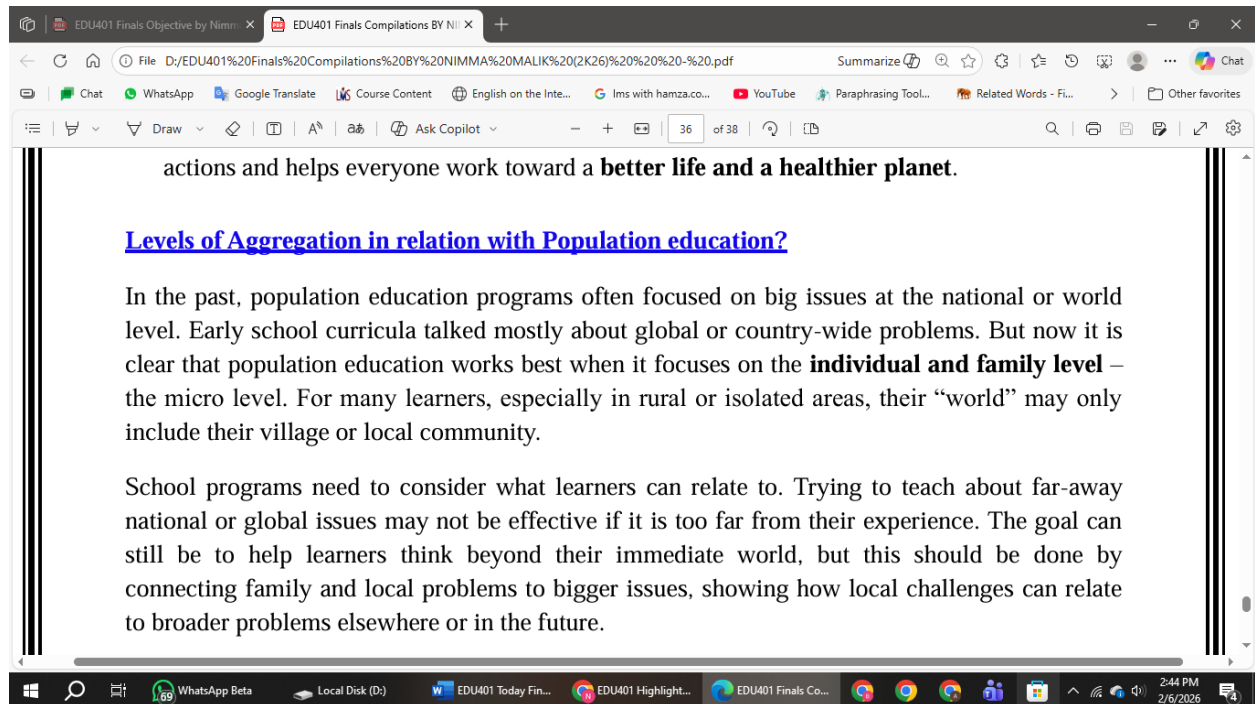

- **Parental awareness and support:** Parents need to understand that technology is important for future jobs. Today's employers want people who can use technology. Parents may need to make some sacrifices to afford devices for their children. Schools can also ask donors or suppliers to provide needed gadgets for classrooms.
- **Technology use rules at school and home:** Clear rules are needed for using technology both in school and at home. At home, things like TV and mobile phones can distract students from study. Parents should set limits on screen time and closely monitor how children use technology.
- **Student training before using technology:** Students should be trained before technology is introduced in classrooms. This helps them understand why learning is changing from books and paper to digital tools. When students understand the purpose, they accept and use technology more positively.

Explain Innovation and Renovation in Population education?

An important goal of population education is to help improve and modernize the education system by introducing Innovation and Renovation. Until now, population education in schools and out-of-school programs has mostly meant adding new content to existing subjects. These additions can be called innovative only in a limited way because adding new material requires some re-organization of the learning system. However, population education programs have usually used the same traditional teaching methods already present in the education system.

Today, many educators believe that the goals of population education need new and innovative teaching and learning methods. In traditional or formal education systems, where teaching is mostly teacher-centered, population education focuses more on student evaluation, decision-making, and responses. This represents a big change in emphasis. Therefore, these teaching methods can be seen as proposals for change.

In education systems that already use less formal and learner-centered approaches, population education further supports innovation and improvement. In systems that are not changing much, introducing population education alone is unlikely to bring major change. However, in systems that are already changing their organization and content, population education can strongly support these changes—especially when the focus is on integrating subjects, making learning more relevant, increasing student participation, and developing skills useful for future life.

Remember me in your
kind and precious
prayers and best of luck!
