Lecture- 01

Listening: An Introduction

Module 01: Parts and Goals of a Listening and Speaking Course

What are the four strands of a well-balanced language course? (Topic 1)

The four strands are meaning-focused input, meaning-focused output, language-focused learning, and fluency development.

What is meaning-focused input, and what are typical activities in this strand? (Topic 2)

Meaning-focused input involves learning through listening and reading with a focus on understanding and gaining knowledge or enjoyment. Activities include extensive reading, shared reading, listening to stories, watching TV or films, and being a listener in a conversation.

What is meaning-focused output, and what are some typical activities in this strand? (Topic 2)

Meaning-focused output involves learning through speaking and writing. Typical activities include conversations, giving speeches, writing letters, telling stories, and instructing someone on how to do something.

What is language-focused learning, and what are some typical activities in this strand? (Topic 2)

Language-focused learning involves the deliberate learning of language features such as pronunciation, spelling, vocabulary, grammar, and discourse. Activities include pronunciation practice, substitution tables, drills, and vocabulary learning.

What is the fluency development strand, and what are some typical activities in this strand? (Topic 2)

The fluency development strand involves developing fluency in listening, speaking, reading, and writing. Activities include speed reading, skimming, scanning, repeated reading, repeated retelling, ten-minute writing, and listening to easy stories.

How should the four strands be balanced in a language course? (Topic 2)

Each strand should receive roughly the same amount of time in a well-balanced course, covering both receptive and productive skills.

What principles guide the teaching of listening and speaking in a course? (Topic 2)

Principles include providing comprehensible input, boosting learning through comprehensible input, supporting and pushing learners to produce spoken and written output, providing opportunities for cooperative interaction, helping learners deliberately learn language items, training learners in language learning strategies, providing fluency development activities, and using analysis, monitoring, and assessment to address learners' needs.

Module 02: Beginning to Listen and Speak in Another Language

What are the aims of a beginners course in listening and speaking? (Topic 3)

The aims are to help learners cope with meaning-focused input and output, motivate them in their language study through successful listening and speaking, and make early learning relevant to their language use needs.

What are some key principles for teaching beginners? (Topic 3)

Key principles include focusing on meaningful and relevant content, maintaining interest through various activities, avoiding overloading learners with new language, providing comprehensible input, and creating a friendly, safe, cooperative classroom environment.

Why is memorizing useful phrases and sentences beneficial for beginners? (Topic 3)

Memorizing useful phrases and sentences helps learners gain early fluency, allowing them to engage in simple communication and take control of conversations without needing to know complex grammar.

What is the "What is it?" technique, and how does it work? (Topic 3)

The "What is it?" technique involves the teacher writing sentences describing something on the blackboard. Learners learn to change the sentences to talk about different things, promoting speaking and listening skills.

What are some techniques for early meaning-focused speaking? (Topic 3)

Techniques include descriptions based on pictures, the "ask and move" activity, "twenty questions," and more.

Module 03: Defining Listening

Why is listening important in language learning? (Topic 4)

Listening is essential in language learning as it provides the basis for building the knowledge necessary to use a language, and it allows learners to receive information and develop their language skills.

What are some cognitive factors influencing listening success? (Topic 4)

Cognitive factors include vocabulary knowledge, syntactic knowledge, discourse knowledge, pragmatic knowledge, metacognition, and prior knowledge.

How do affective factors influence listening success? (Topic 4)

Affective factors include anxiety, self-efficacy, and motivation. They can either facilitate or hinder listening success.

What are the two broad types of listening, and how do they differ? (Topic 4)

The two types are one-way listening (transactional listening) and two-way listening (interactional listening). One-way listening involves information transfer, while two-way listening is about maintaining social relations.

What are bottom-up processes in listening? (Topic 4)

Bottom-up processes involve assembling the message piece by piece, starting with auditory-phonetic, phonemic, and moving up to the semantic and pragmatic levels.

What are top-down processes in listening? (Topic 4)

Top-down processes involve using prior knowledge and context to predict the message and make inferences. Inference is a key process in top-down listening.

What are listening strategies, and how can they be classified? (Topic 4)

Listening strategies are techniques for comprehension and recall. They can be classified as top-down or bottom-up strategies, depending on whether they rely on context and background knowledge or language itself.

Lecture- 02

Levels of Processing in Listening-I

Module-04: NEUROLOGICAL PROCESSING

What is the primary physiological system for the reception of sound waves?

Hearing is the primary physiological system for the reception of sound waves.

What is the normal threshold for human hearing in terms of pascals?

The normal threshold for human hearing is about 20 micropascals.

How does sound perception relate to the auditory cortex of the brain?

Sound waves are transmitted from the outer ear through the inner ear to the auditory cortex of the brain for processing.

What does "hearing forward" and "hearing backward" refer to in sound perception?

"Hearing forward" refers to anticipating what is about to be heard, while "hearing backward" is about retrospectively organizing what has just been heard.

What is the key difference between hearing and listening?

The key difference is intention. Listening involves a greater degree of intention than hearing.

What are the components of the human auditory system?

The human auditory system consists of the outer ear, middle ear, inner ear, and auditory nerves connecting to the brain stem.

What is the role of the primary auditory cortex in the brain?

The primary auditory cortex processes incoming auditory information.

How does consciousness relate to intentionality in the context of listening?

Consciousness is related to intentionality, where intention is an acknowledgment of a distal source and a willingness to be influenced by that source.

What are the five properties of consciousness that affect listening?

The five properties of consciousness are embeddedness in peripheral awareness, dynamic nature, point of view, need for orientation, and the ability to focus on one thing at a time.

How does attention relate to consciousness in the context of listening?

Attention is the operational aspect of consciousness and involves focusing on specific aspects of input.

What are the three neurological elements involved in the process of attention?

The three neurological elements of attention are arousal, orientation, and focus.

Why is selective attention important in listening?

Selective attention is necessary to commit limited cognitive resources to one stream of information when multiple sources are present.

What are the six critical differences among individuals in neurological processes?

These differences include local processing, commitment and plasticity, integrative circuits, functional neural circuits, strategic control, and the level of attention.

Module-05: LINGUISTIC PROCESSING - I

What is the goal of speech production and how does it relate to communication efficiency?

The goal of speech production is to maximize communication by putting as much retrievable information into every second of speech as possible.

How does the listener process language efficiently during speech perception?

Listeners maximize recognition and minimize categorization during speech perception.

What are the three types of perceptual experience that aid in maximizing speech recognition?

Listeners use articulatory causes for sounds, psychoacoustic effects, and a model of the speaker's linguistic intentions to maximize speech recognition.

What is the role of word recognition in spoken language comprehension?

Word recognition is the basis of spoken language comprehension, and it involves identifying words and activating associated knowledge.

How does the concept of a word differ in spoken and written language?

The concept of a word in spoken language is part of a phonological hierarchy, and it differs from the written version of a language.

What are the main synchronous tasks of a listener in word recognition?

The main synchronous tasks are identifying words and lexical phrases and activating knowledge associated with those words and phrases.

What are the key processes involved in recognizing words during speech perception?

Words are recognized through perceived sound, and speech is processed sequentially word by word, with the focus on locating the onset of the following word and providing syntactic and semantic constraints.

What role do intonation units play in speech processing?

Intonation units help in chunking speech into meaningful units, allowing for more efficient processing.

What are the six types of information available in paralinguistic signals in speech?

The six types of information include emotional, grammatical, informational, textual, psychological, and indexical information.

Module-06: Linguistic Processing - II

What is phonotactic knowledge, and why is it important for effective speech recognition? (Module 06)

Phonotactic knowledge refers to understanding the allowable sounds and sound patterns in a language. It is crucial for effective speech recognition because it helps encode speech into linguistic units. This knowledge is acquired and specialized for one's native language during childhood.

What are allophonic variations, and why do they occur in language? (Module 06)

Allophonic variations are alternate pronunciations of a word or phrase that result from contextual influences. They occur due to efficiency principles in production, where speakers tend to use the minimum energy required to create a recognizable phonological string.

Explain assimilation in the context of phonological processes. (Module 06)

Assimilation is a sound change in which phonemes, particularly consonants or vowels, become more similar to nearby sounds due to phonological context. It is a common phonological process that can occur within words or between words.

What is cluster reduction, and when does it typically occur in English? (Module 06)

Cluster reduction is the simplification of a consonant cluster by eliding one of the consonants, especially when two or more similar consonants come together. The likelihood of cluster reduction increases with the length of the cluster.

How does vowel reduction affect the acoustic quality of vowels? (Module 06)

Vowel reduction refers to changes in the acoustic properties of vowels, which can be related to factors like stress, duration, loudness, and articulation. Vowel reduction is perceived as weakening of the vowel sound.

What is syntactic parsing in linguistic processing, and why is it important? (Module 06)

Syntactic parsing involves mapping incoming speech onto a grammatical model of the language. It is crucial for understanding the structure of sentences and discourse. It helps assign parts of incoming speech to syntactic categories and allows for the prediction of functions and disambiguation.

How does the first pass of syntactic processing differ from the second pass? (Module 06)

The first pass has a broader time frame, typically spanning six to eight seconds, and focuses on identifying syntactic categories and speeding up aural processing. The second pass operates within a more constrained time frame and integrates syntax at the sentence level.

What role does grammatical knowledge play in syntactic processing? (Module 06)

Grammatical knowledge is essential for understanding word order, subject-verb agreement, case inflections, and other cues that influence the processing of meaning in language. It helps the listener apply syntactic rules and structures.

How do listeners integrate non-verbal cues, such as visual and kinesic signals, into linguistic processing? (Module 06)

Listeners integrate non-verbal cues by using visual signals (exophoric and kinesic) to enhance their understanding of spoken language. These cues provide references, emphasis, and direction within the discourse.

Explain the role of baton signals in non-verbal communication. (Module 06)

Baton signals are hand and head movements associated with emphasis and prosodic cadence. They serve to highlight important points and add emphasis to the speaker's message.

Lecture- 03

Levels of Processing in Listening-II

Module-07: Semantic Processing

What is semantic processing in listening?

Semantic processing encompasses the listening processes involved in comprehension, inferencing, learning, and memory formation.

What is the primary goal of listening according to the lecture?

Comprehension is often considered the first-order goal of listening.

What are the fundamental units of reason and comprehension, according to the lecture?

Concepts, not words, are the fundamental units of reason and comprehension.

How is the process of comprehension related to memory in listening?

Comprehension involves the mapping and updating of references that the speaker uses, which happens in an ongoing cycle during listening, and it's intricately tied to memory.

How does a listener distinguish between given and new information in speech?

The speaker conveys distinctions between given and new information through presentation cues, which include linguistic and paralinguistic cues, such as intonational stress.

What are schemata in the context of listening comprehension?

Schemata are activated portions of conceptual knowledge that assist in understanding incoming text.

What is the role of inference in constructing meaning during listening?

Inference is a problem-solving process that helps the listener arrive at an acceptable interpretation of the text.

How do listeners compensate for limitations during semantic processing?

Listeners may use compensation strategies such as skipping, approximation, filtering, incompleteness, and substitution to maintain comprehension.

What are the two phases of short-term memory discussed in the lecture?

The two phases are a brief sensory unresolved after-image lasting up to two seconds and a more perceptually resolved short-term memory lasting up to twenty seconds.

How is learning defined in psychological terms in the lecture?

Learning is defined as the durable modification of a concept in memory due to an experience.

What are the two types of memory systems involved in learning?

Type 1 is associative processing, and Type 2 is rule-based processing.

What are the five elements required for learning in a cognitivist framework according to the lecture?

The elements are units of learning, activation values, connection weighting, learning rules, and emotional and motivational weighting.

Module-08: Pragmatic Processing

What is pragmatic competence essential for in listening?

Pragmatic competence is essential for the social dimension of listening, including pragmatic comprehension, interactional competence, and symbolic competence.

What does a pragmatic perspective consider regarding the listener's role in interaction?

A pragmatic perspective emphasizes that the listener's presence entails engagement in an event, encompassing the listener's relationship with the speaker and awareness of emotional shifts in the speaker's state.

Name four key pragmatic notions important for a listener's understanding of spoken language.

The four key pragmatic notions are deixis, intention, strategy, and conversational meaning.

What is deixis, and why is it important in understanding listening in context?

Deixis refers to anchoring language to a real context, including variables like time, space, objects, persons, and status. Deictic elements of an utterance can only be interpreted with respect to the physical context in which they are uttered.

What are the identifiable features of context that listeners consider when interpreting spoken language?

The identifiable features of context include the addressor, addressee, audience, topic, setting, code, channel, event, message form, key, and purpose.

What is the central aspect of pragmatics concerning speaker and listener intentions in discourse?

The central aspect is the interaction of intentions between the speaker and the listener, which contributes to the meaning of the discourse.

How did Austin replace the constative–performative distinction in speech acts?

Austin replaced it with a threefold contrast: locutions, illocutions, and perlocutions.

What are the four basic co-operative principles of conversation outlined by Grice?

The four co-operative principles are the maxim of quantity, the maxim of quality, the maxim of relevance, and the maxim of manner.

How do speakers sometimes create specific modifications and nuances of meaning by flouting these co-operative principles in conversation?

Speakers flout these principles strategically to evoke specific emotional responses or achieve particular effects when adhering to conventional conventions wouldn't be as effective.

What is the primary purpose of listener response in discourse?

The primary purpose is to contribute to the conversation, achieve meaning, and connect with the speaker by responding to their speech.

Module-09: Automatic Processing

What does Automatic Processing (AP), or Natural Language Processing (NLP), refer to in computer science?

It refers to computer interfaces that can understand and produce natural language, such as English or Chinese.

What is the main challenge in NLP applications that use spoken language as input?

The challenge is speech recognition, particularly due to the large vocabulary size, fluency and connectedness of spoken language, and variations introduced by factors like accents and dialects.

What is the initial goal of an Automated Speech Recognition (ASR) device in processing spoken language?

The initial goal is to determine the words spoken in the input.

What is the role of phonological analysis in speech recognition for NLP applications?

Phonological analysis is the initial stage of speech recognition, helping convert the speech signal into electronic data, enabling word recognition.

What is the primary goal of semantic processing in NLP?

The primary goal is to convert incoming speech into idea units for decision-making, action, or response.

What is Information Extraction (IE) in NLP, and why is it used in more open discourse domains?

Information Extraction is concerned with identifying predefined types of information from text. It is used in open discourse domains to extract information and activate concept maps.

What are the five pragmatic standards users may expect from an NLP system, as identified in the roadmap document by Hirschman and Gaizauskas?

The five pragmatic standards are timeliness, accuracy, usability, completeness, and relevance, with a user-centered evaluation of the system.

What is the significance of pragmatic processing in NLP?

Pragmatic processing involves deriving knowledge from external commonsense information, integrating it with semantic processing, and generating suitable responses based on the social or action-oriented value of the input.

Lecture- 04

Listening in Language Acquisition

Topic 1: Listening in L1 Acquisition

Question 1: What are the key components of L1 acquisition for infants?

L1 acquisition for infants involves the simultaneous development of multiple cognitive and social skills through interaction with other L1 speakers, including an abundance of listening.

How do infants initially perceive speech sounds?

Infants start with a language-general capacity to discriminate thousands of potential phonetic contrasts in any language and then refine this ability based on the input they receive.

What is the role of sound prototypes in L1 acquisition?

Infants' nervous systems begin with many connections and gradually pare them down to templates that align with the phonotactic system of the language they are acquiring.

What changes in sound perception occur during an infant's first year of life?

Over the first year, infants develop the ability to discriminate differences in the utterances they hear, which is crucial for distinguishing between different speech sounds and speakers.

Why is it important for infants to learn to discriminate word boundaries in a language?

Word boundaries are essential because words are rarely isolated in fluent speech. Infants need to learn how words are marked in a language, which is known as gaining phonotactic knowledge.

Lexical Acquisition

What is the first task a child must perform during the acquisition of a new word?

The first task is "labelling," which involves understanding the connection between the sound, object, and meaning of a word.

How can the labelling task be accelerated?

The labelling task can be accelerated through strategies like "generalization" and "differentiation."

What is "under-extension" in the context of meaning acquisition?

"Under-extension" occurs when a child oversimplifies a concept and applies a label to only one prototypical object.

What is the third task in the acquisition of fuller word meanings?

The third task is the "network-building task," which involves working out the relationships between words and concepts, as well as connecting sounds and meanings to visual concepts and grammatical information.

Development of Semantic Processing

How do cognitive developments and language acquisition coincide in a child learning their first language?

Cognitive developments serve as an experimental playground for a child to try out new language, and language development and cognitive development are interconnected.

What are the four primary cognitive structures associated with child development stages?

The four primary cognitive structures are "sensorimotor operations," "pre-operations," "concrete operations," and "formal operations."

What is the role of adaptation in cognitive and linguistic development?

Adaptation involves the processes of "assimilation" (interpreting events using existing cognitive structures) and "accommodation" (changing cognitive structures to make sense of the environment) in cognitive and linguistic development.

How can caretakers and teachers facilitate a child's cognitive and linguistic development?

Caretakers and teachers can facilitate development by providing environments, stimulation, and listening opportunities that engage the child in new concepts.

Topic 4: Development of Pragmatic Processing

What speech style is commonly used when adults talk to young children?

Adults often use "Child-Directed Speech (CDS)," characterized by repetitive patterns, manipulated intonation, and simplified language, when talking to young children.

How does CDS facilitate language acquisition?

CDS helps children by managing attention, promoting positive affect, improving intelligibility, providing feedback on comprehension, and encouraging conversational participation.

What is semantic contingency in CDS?

Semantic contingency means that caretaker talk in CDS tends to focus on objects and events to which the child is already paying attention.

What is the main purpose of CDS at a linguistic level?

At a linguistic level, CDS provides both positive and negative evidence to help the child develop productive and receptive language skills.

Why is social interaction crucial for cognitive and linguistic development?

Social interaction plays a fundamental role in the development of cognition and language, as children actively use intake to formulate the underlying grammar rules of the language and establish mutuality with caretakers.

Listening In Language Acquisition - II

What is the fundamental goal of phonological processing for L2 listeners?

Word recognition.

What role does lexical processing play in L2 language understanding?

Lexical processing helps L2 users access the conceptual knowledge needed for understanding.

What is the importance of bilingual speech processing in L2 acquisition?

It relates to cognitive transfer from the L1 to the L2.

What is the essence of phonological competence in L2?

The appropriate use of lexical segmentation strategies.

Why might L2 learners suppress syntax processing according to the lexis-first comprehension principle?

To focus on understanding messages primarily through lexis.

What is the key cognitive process that makes information in L2 input available for further processing?

Detection of new forms in the L2 spoken input.

What is the initial phase of lexical acquisition in L2, and what does it involve?

Mapping, which involves processing grammatical, contextual, and communicative information to create a map of referent and meaning in the mental lexicon.

What is the difference between L1 and L2 lexical acquisition through mapping?

In L1, new words are learned while learning new concepts, but in L2, learners must accept counterparts for known L1 words and concepts in the L2.

What are cognates, and how do they aid L2 lexical acquisition?

Cognates are words with a common etymological origin, and cognate transfer helps L2 learners learn L2 target words faster due to semantic and phonological similarity.

What is the concept of loan transfer in L2 lexical acquisition, and how does it work?

Loan transfer involves using loan words from the learner's L1 to the L2 being acquired, which can enhance vocabulary.

What are the processes loan words undergo in L2 acquisition?

Transliteration, phonological transformation, shortening, hybridization, and grammatical transformation.

Why can semantic processing be challenging for L2 listeners, and what is needed to address this challenge?

L2 listeners may not be conscious of the schemata they use, and addressing this requires becoming aware of and altering these schemata.

How do cultural differences affect L2 listening and comprehension, particularly in topics unfamiliar to the learner?

Cultural differences influence cognitive anchors and schemata used for understanding and can lead to potential misunderstandings.

What aspects of language acquisition are covered by pragmatic competence, and why is it considered challenging in an EFL context?

Pragmatic competence covers knowledge of rules for taking speaking turns, interpreting intonational emphasis, and much more; it's challenging in EFL due to cultural differences in communication styles.

What is the mismatch view in intercultural communication, and what does it imply?

The mismatch view suggests that conversations between people of different cultural backgrounds may become problematic due to contrasting discourse styles and interpretation of participant and activity frames.

What is the alternate point of view regarding intercultural interaction, especially in NS and NNS scenarios?

In this view, intercultural interaction follows similar inter-subjective rules as intracultural interaction, with the aim of balanced, reciprocal participation.

What is one of the key problems faced by NNS in interaction, and what can trigger it?

One key problem is being reduced to a passive listener, often triggered initially by language understanding problems.

What are the sources of understanding difficulties in conversation, in addition to language processing issues?

Understanding difficulties can arise from informational packaging and the conceptual difficulty of the content being discussed.

Lecture- 05

Teaching Listening-I

Issues Related to Teaching and Learning Listening

Is listening considered a passive skill?

No, listening is not a passive skill; it involves various cognitive processes.

What are some cognitive processes involved in listening?

Listeners perceive sounds, segment words, accumulate meaningful units, register stress and intonation, and retain information.

Why do L2 listeners sometimes feel passive in their approach to listening?

L2 listeners may feel passive because they don't feel in control and are often unsure about understanding the target language.

The Importance of Teaching Listening Processes

Is getting the right answer the main goal in L2 listening instruction?

While understanding the information is important, the main goal is to teach learners the process of listening and develop metacognitive skills.

How can teachers help learners demystify the processes involved in successful listening?

Teacher guidance and scaffolded listening practice can help make the listening processes explicit and understandable to learners.

Learner Anxiety in L2 Listening

What contributes to learner anxiety in L2 listening?

Factors include the perception that listening is difficult and beyond control, focus on the product of listening, and the association of listening with evaluation.

How can teaching approaches reduce learner anxiety in listening?

Focusing on the process of listening and using pre-listening activities can help reduce anxiety and empower learners.

The Role of Vocabulary in Listening

What percentage of listening success is related to vocabulary knowledge?

Recent studies suggest that up to 50 percent of success in listening ability can be explained by vocabulary knowledge.

When can learners pay attention to isolated features of speech?

During the post-listening stage, learners can pay attention to isolated features of speech and build their metacognitive knowledge of authentic speech.

Teaching Listening with Video vs. Audio

Is teaching listening through video always better than audio alone?

Not necessarily; adding a visual component can be distracting if it doesn't closely match the audio content.

What can happen when the visual content in a video doesn't match the audio?

It can distract listeners and hinder their concentration on the audio.

The Relationship between L1 and L2 Listening Ability

Can good L1 listeners become good L2 listeners?

Research suggests that L1 listening ability contributes to L2 listening success, but metacognitive instruction can help less skilled L2 listeners.

What can metacognitive instruction do for less skilled L2 listeners?

It can raise their awareness about the listening process and teach effective strategies for comprehension and listening development.

Interactive Listening vs. One-way Listening

Is interactive listening always more difficult than one-way listening?

Interactive listening can be easier in some aspects, such as the opportunity to seek clarification, but it can be more demanding when listeners are expected to reply and attend to non-verbal signals.

Providing Context for Listening Activities

Does providing context for a listening activity give away too much information?

No, providing context helps learners activate their prior knowledge and predict what they might hear, which is a normal part of real-life listening.

Developing Listening Skills Outside the Classroom

Is letting students listen on their own according to their interests the best way to develop listening skills?

Listening outside the classroom is useful, but preparing students in class with metacognitive tools and task-based practice can enhance their learning.

The Use of Captions and Subtitles in Learning to Listen

How can captions and subtitles assist in learning to listen?

Captions can improve word identification, reinforce understanding of the listening text, and direct attention to gaps in comprehension during repeat listens.

Challenges and Opportunities in Listening Instruction

What is a common issue with many listening activities in language classrooms?

Many focus on testing how well learners can listen, which can increase anxiety.

Why do learners often feel anxious when listening?

They are often asked to show how much they understand or reveal what they haven't understood, increasing stress and anxiety levels.

What is one challenge faced by learners when listening to real-time speech?

Learners don't know how to listen and are rarely taught how to listen once the audio or video begins.

What is metacognition, and why is it important in learning to listen?

Metacognition is the ability to control thoughts and regulate learning. It enhances comprehension and plays a vital role in learning to listen. Teachers need to engage learners' metacognition in teaching listening.

Module-13: Approaches to Teaching Listening

Introduction:

What was the traditional view of listening as a skill?

It was considered a passive skill that would develop naturally with speaking and reading.

How is listening now viewed in teaching?

It's seen as an active skill that can be taught directly.

Contexts for Teaching Listening:

What provides learners with goals and standards for language learning?

Social contexts do.

What are some specific criteria for defining social context and learning background?

Contact, identity, competence, function, and goal.

Why are these criteria helpful in designing listening instruction?

They help initiate an approach to listening instruction that matches the context.

SLA Research and Language Pedagogy:

What does SLA stand for?

Second Language Acquisition.

How has SLA research impacted language teaching?

It has influenced language teaching methodologies.

According to Ellis (2009), what are the seven positions regarding SLA research?

They range from SLA having no influence to SLA having a reciprocal relationship with language pedagogy.

What are the six key influences derived from SLA research?

Affective filter hypothesis, input hypothesis, interaction hypothesis, processability hypothesis, metacognition hypothesis, and sociocultural hypothesis.

Affective Filter Hypothesis:

What does the affective filter hypothesis propose?

It suggests that affective variables, like motivation and attitude, influence the L2 learning process.

What kind of listening experiences are generally beneficial for reducing anxiety?

Listening experiences that help students lessen their anxiety about listening.

Input Hypothesis: Selecting Accessible Input for Acquisition:

According to the input hypothesis, what leads to language acquisition?

Language is acquired "by understanding messages or by receiving comprehensible input."

What does instruction need to focus on according to the input hypothesis?

It should aim to provide comprehensible input slightly above the learner's current level.

Interaction Hypothesis: Using Interaction to Make Input Accessible:

How does interaction contribute to language acquisition?

It contributes by allowing learners to provide themselves with comprehensible input through interaction adjustments, providing negative feedback, and presenting opportunities for "pushed output."

Processability Hypothesis: Tuning Input to Trigger Acquisition:

What are the two pedagogic approaches to help learners develop their syntactic processing of oral language?

Enriched input and processing instruction.

What are Slobin's operating principles?

They include paying attention to the ends of words, being aware of linguistic elements that encode relations, avoiding thinking about exceptions, attending to underlying semantic relations, and assuming coherence.

Metacognition Hypothesis: Using Explicit Strategies to Activate Listening Capacity:

What are learning strategies in the context of language learning?

They are attitudinal plans or behavioral devices that students use to acquire knowledge or skills.

How can explicit listening strategies help students?

They help students listen more efficiently and become more autonomous learners.

Sociocultural Hypothesis: Seeking Appropriate Contact to Promote Development:

What does Sociocultural Theories (SCT) of language acquisition posit?

It posits that language learning is a socially situated phenomenon.

What determines language acquisition according to SCT?

The degree of motivation to acculturate with the target language group.

Introduction to Listening in Multimedia Environments

What technology significantly changed L2 listening instruction?

The phonograph allowed the recording and repeated playback of acoustic signals.

How has technology evolved since the phonograph in L2 listening instruction?

Technology has seen major advances in recent decades, offering more options for teaching and learning L2 listening.

How does multimedia contribute to L2 listening development?

Multimedia provides access to a wide range of input options through the internet and technological tools.

Impact of Visual Media in Listening Instruction

What theoretical support exists for adding a visual component to listening instruction?

The generative theory of multimedia learning and dual coding theory support the idea that visual and aural information reinforce each other for better comprehension.

What do kinesics refer to in the context of listening to a speaker?

Kinesics refers to body language, facial expressions, hand gestures, and non-verbal cues that aid in interpreting a speaker's message.

Listener Choices in Multimedia Environments

What advantages do multimedia environments offer to L2 learners?

Learners have the choice and control to implement various strategies when practicing listening skills.

Support Options in Multimedia Listening

What are some help options available in multimedia listening environments?

Help options may include a dictionary, cultural notes, transcripts, subtitles, feedback, and expert modules.

Captions and Subtitles

How can captions and subtitles assist L2 listeners?

They can help with word identification, vocabulary learning, and recognizing differences between spoken and written language.

Multimedia Tools for Listening Development

What are podcasts, and how can they benefit L2 listening practice?

Podcasts are downloadable audio or video files that offer creative out-of-class listening practice, extending learning opportunities.

What is oral computer-mediated communication, and why is it significant for language learners?

Oral computer-mediated communication involves voice and video applications that provide interactive listening practice, especially for learners with limited access to native speakers.

Meta-technical Skills for Listening in Multimedia Environments

How can learners improve their listening skills when using multimedia tools?

Learners may need guidance in navigating options, considering learning styles and strategies, to extract relevant meaning from the material.

Considerations for Teaching and Learning in Multimedia Environments

What should teachers consider when using visual materials for teaching L2 listening?

Teachers should choose materials where the content of the visual input closely matches the aural input, especially for lower-level learners.

How can help options be used effectively in multimedia environments?

Provide guidance to learners on how and when help options can enhance comprehension and listening development.

What should teachers keep in mind when using captions and subtitles?

Use captions and subtitles to reinforce understanding after an initial listen and encourage word segmentation skills, but avoid over-reliance on them for comprehension.

What are some potential benefits of using podcasts for L2 listening practice?

Podcasts offer convenience, the ability to extend practice beyond class, and can help learners acquire note-taking tips and lecture cues.

How can oral computer-mediated communication benefit language learners?

It offers opportunities for interactive listening and speaking, especially in contexts with limited access to native speakers.
