

ZOO 507 Quiz 1 Spring 2020

Topic: 89 to 120

1. The process of successful establishment of species in the new area is called **ecesis**.
2. Mechanism of thermoregulation regulate in the body of an organism. **temperature**
3. All are example of endoparasite except one **Flea**
4. Temperature is important for **All of the above**
5. As species richness and evenness increase, species diversity will **increase**.
6. which one of the following is not a character of a community **curiosity**
7. Hibernation in large animal is like bear is termed as **winter sleep**
8. Commensalism is a relationship **useful for one species and second is neither helped nor harmed**
9. Mutualism is a ____ relationship **useful for both species**
10. Aggregation of population of different species living together in a specific area constitutes a biotic **community**
11. **Community structure** is essentially the composition of a community, including the number of species in that community and their relative numbers.
12. The formation of a climax community from and abandoned farmland is an example of **secondary succession**
13. Amphibians, fish and reptiles cannot maintain their body temperature rather it fluctuates with environmental temperature they are called **poikilotherms**.
14. A self regulating, self sustaining and independent unit of community is called **Major Community**
15. Which one of the following is not an example of major community? **Plant**
16. The hypothalamus work like a/an **thermostat**
17. Animals like birds and mammals that maintain their internal body temperature constant are **homeotherms**
18. Sunlight is very important factor in **photosynthesis**
19. The term **thermoregulation** is used for maintenance of an internal body temperature of an organism
20. Products of photosynthesis are **glucose and oxygen**
21. normal body temperature of human being is **37 degree c**
22. How many biotic community are there? **3**
23. Which of the following is not true about torper? **Higher metabolic activity**
24. The contribution of each plant species to the vegetation can be defined **Species composition**

25. The daily time of decreased metabolism and lowered body temperature is called **Hibernation**
26. **Species richness** is the number of different species in a particular community
27. **Species richness** is defined as the number of species represented in a specific region, landscape or an ecological community.
28. Hibernation can be defined as **to sleep for an extended period of time during the winter.**
29. The nonliving components of an ecosystem, such as temperature, precipitation, wind and soil are **abiotic factors**
30. What is the difference between evolution and coevolution? **coevolution results when two or more species interact**
31. Which of the following describes a coevolutionary relationship? **None of the above, on its own, describes a coevolutionary relationship.**
32. Aestivation is also called **summer sleep**
33. Which of the following is not responsible for heat loss? **Excessive fat deposits**
34. Those animal which regulate their body temperature by external sources like sunlight or a heated Rock are called **ectotherms**
35. Types of animals which can approximately maintain their constant body temperature are called **endothermic**
36. The number of individuals per species is called **Species abundance**
37. Low quality energy is **dispersed form of energy**
38. Which of the following is not the character of ectotherms? **Generate body heat due to high metabolic rate**
39. Which one of these are true hibernators? **All of the above** (bats, insectivore, ground squirrels, etc)
40. A mutualistic Association between algae and fungus in which both the partners get benefits from each other is known as **lichen**
41. What is lichens? **Association between algae and fungus**
42. Sunlight is very important factor in **photosynthesis**
43. The major difference between hibernation and torpor is **hibernation is a deeper sleep**
44. In ectotherms, **external forces** control body temperature
45. How many types of ecological succession are there? **two**
46. The contribution of each plant species to the vegetation can be defined as **species composition**
47. Which of the following animals do not go under winter sleep? **snail**

48. Which of the following factor is not responsible for heat loss? **Excessive Fat Deposits**
49. On the basis of wavelength there are all **2** type of electromagnetic radiations
50. **Species abundance** is the number of individuals per species
51. Which of the following is not a high quality energy? **Moonlight**
52. Human eye can detect electromagnetic radiation of wavelength range? **380 to 740 nm**
53. During cold **shivering** occurs to generate heat from respiration
54. A form of kinetic-energy, in which energy travel in the form of a wave as a result of changes in electric and magnetic fields are **electromagnetic-radiations**
55. Those animals which regulate their body temperature by external sources like sunlight or heated rock surface are called **ectotherms**
56. During sweating body surface temperature of an organism **decreases**
57. What is called for the process when older communities of plants and animals are replaced by newer communities? **Ecological succession**
58. **camouflage** is a kind of coloration or pattern that help an animal to appear to blend with its surroundings
59. Arousal from torpor takes around one hour and involves violent shaking and muscle contraction. animal that exhibit torpor are **All of the above** (Bear, raccoon, skunks)
60. What is called when two species trigger evolutionary changes in each other? **Coevolution**
61. Electromagnetic radiations of short wavelength have **more energy** content than electromagnetic radiations of long wavelength
62. Australian burrowing frog goes under **aestivation**
63. During **hibernation** the body temperature of animal drops and its heartbeat and its breathing slows down with minimum use of energy
64. The final stable community in an ecological succession is called the **climax community**
65. Which one of these is not true about hibernation? **Also known as summer sleep**
66. The torpid state may last for **months**
67. The **structure of community** is the result of many interacting factors both abiotic (non-living) and biotic (living organisms related)
68. What is the difference between evolution and coevolution? **Coevolution results will two or more species interact**

69. **Species richness** is the measure of number of species per unit area found in a particular site or place
70. How many types of biotic community are there? **3**
71. Which one of these is not a biotic factor? **Sunlight**
72. Humming bird can regulate its own body temperature independent of environment hence is called **endotherm**
73. Winter sleep is a form of **hibernation**
74. Which of these factor in a community is NOT an abiotic factor? **Predator**
75. Carbon dioxide and water cannot react and release oxygen if **sunlight** is absent
76. Aestivation occur because of **hot and dry climate**
77. Which one of these are NOT an electromagnetic radiations with short wavelength? **Infrared radiation (IR)**
78. Hibernation is a mean of **energy conservation**
79. Light plays a vital role in ____ of the following life running processes. **All of the above**
80. what is called for the term in which all the living organisms that occupies an area undergoing a primary succession in the beginning stages **pioneer community**
81. **High quality energy** is concentrated form of energy and has a high capacity to do work
82. _____ refers to the evenness of distribution of individuals among species in a community **relative abundance**
83. Ectotherms are also called **cold blooded animals**
84. **Coevolution** is a change in the genetic composition of one species or group in response to a genetic change in another specie or group
85. The fluctuations in the intensity of sunlight in different regions of the World affect the **temperature**
86. **Species diversity** is a measure of community complexity.
87. There are **2** types of energy on the base of energy quality
88. **Diversity** is a measure of the evenness in distribution of the individual organisms among the species present

Solved by WAQAS EJAZ (MSC Zoology 1st Semester)

VU SUPREME TALEEM
