

PSY502 - Lesson 29+30

Sigmund Freud

- The psychoanalytic movement
 - The structure of the mind: Id, Ego, Superego
 - Dreams and the unconscious
 - Defense mechanisms
 - Psychoanalysis as a treatment
 - Anna Freud, Heinz Hartmann, and Ernst Kris
-

PART 1: WHO WAS SIGMUND FREUD?

Sigmund Freud (1856–1939) was an Austrian psychiatrist.

Psychiatrist means: a medical doctor who treats mental and emotional disorders.

He lived mostly in Vienna and later moved to England. He is famous because he invented **psychoanalysis**.

Psychoanalysis means:

A method of understanding and treating mental problems by exploring the unconscious mind.

Freud started as a medical doctor and researcher. At that time, doctors were using **hypnotism** to treat mental illness.

Hypnotism means:

A technique where a person is put into a trance-like state to increase focus and reduce awareness.

Freud worked with:

- Jean-Martin Charcot in Paris

- Josef Breuer in Vienna

They treated people with **hysteria**.

Hysteria means:

A condition where emotional distress shows up as physical symptoms like paralysis, blindness, or fainting without a physical cause.

From these patients, Freud realized something important:

👉 People are not aware of everything that affects their behavior.

👉 There is a **hidden part of the mind** called the unconscious.

PART 2: THE UNCONSCIOUS MIND

The **unconscious mind** is the part of the mind that holds:

- Forgotten memories
- Repressed wishes
- Fears and desires we do not know we have

Freud believed:

Mental illnesses come from conflicts in the unconscious mind.

Example:

A person is afraid of dogs but does not know why. Deep inside, there may be a childhood memory of being bitten that was pushed out of awareness.

PART 3: STRUCTURE OF PERSONALITY – ID, EGO, SUPEREGO

Freud said the mind has three main parts.

1. ID

The Id is the primitive, emotional, irrational part of the mind.

- Present at birth
- Wants pleasure
- Wants things NOW

It follows the **pleasure principle**.

Pleasure principle means:

"I want what feels good and I want it immediately."

Example:

A baby cries when hungry. It does not care about time, rules, or others. It just wants milk.

1. EGO

The Ego is the rational and realistic part of the mind.

- Develops as we grow
- Understands reality
- Balances the Id and Superego

It follows the **reality principle**.

Reality principle means:

"I know I cannot always get what I want, so I will find a realistic way."

Example:

You want to eat cake at midnight. Your Id says: "Eat it now."

Your Ego says: "I will eat it tomorrow morning so I stay healthy."

1. SUPEREGO

The Superego is the moral part of the mind.

- Develops last
- Learns rules from parents and society
- Tells us what is right and wrong

It has two parts:

- Ego Ideal – what we SHOULD be
- Conscience – what we should NOT do

Example:

Your Superego says:

"You should not lie."

"You should help others."

"You should feel guilty if you steal."

So the personality works like this:

Id = wants

Superego = should

Ego = decides

PART 4: PSYCHOSEXUAL DEVELOPMENT

Freud said people grow through **psychosexual stages**.

Psychosexual means:

Psychological development linked to how pleasure is focused in the body.

He believed:

Unresolved conflicts in childhood cause problems in adulthood.

Example:

If a child is too strictly toilet-trained, they may become overly controlling as an adult.

PART 5: DREAMS AND EVERYDAY SLIPS

Freud said the unconscious shows itself in:

- Dreams
- Slips of the tongue
- Forgetting names
- Small mistakes

This is called **psychopathology of everyday life**.

Meaning:

Even small daily errors reveal hidden thoughts.

Example:

You call your teacher "mom".

Freud would say: your unconscious mixed roles.

PART 6: DREAM THEORY

Freud said dreams have two levels:

- Manifest content – what you remember seeing
- Latent content – the hidden meaning

Dream work includes:

- Displacement – shifting emotion from one thing to another
- Condensation – many ideas combined into one image
- Symbolism – objects represent deeper wishes

Example:

Dreaming of a journey might symbolize wanting change in life.

PART 7: DEFENSE MECHANISMS

Defense mechanisms are unconscious ways to protect the Ego from anxiety.

Common ones:

1. Repression

Pushing painful thoughts out of awareness.

Example:

Forgetting a traumatic accident.

1. Denial

Refusing to accept reality.

Example:

A student refuses to see their bad grade.

1. Regression

Going back to childlike behavior.

Example:

An adult starts crying like a child after stress.

1. Projection

Putting your own bad thoughts onto others.

Example:

A jealous person accuses others of cheating.

PART 8: NEUROSIS

Freud said:

Neurosis = Predisposition + Trauma

Predisposition = natural tendency

Trauma = emotional shock

Meaning:

Some people are more sensitive, and when trauma happens, neurosis develops.

PART 9: PSYCHOANALYSIS AS TREATMENT

Freud created **psychoanalysis** as therapy.

Main methods:

- Free association – say whatever comes to mind
- Dream interpretation – find hidden meaning
- Analyzing slips and mistakes
- Resistance – when patient avoids topics
- Transference – patient transfers feelings onto therapist

Transference means:

Treating the therapist like someone from your past.

Example:

You feel angry at your therapist like you did with your father.

PART 10: ANNA FREUD

Anna Freud was Sigmund Freud's daughter.

She worked in **child psychology**.

Her major idea:

Children sometimes **identify with the aggressor**.

Meaning:

A scared child copies the behavior of someone who dominates them.

Example:

A bullied child becomes a bully.

PART 11: HEINZ HARTMANN

Founder of **Ego Psychology**.

He focused on how the Ego:

- Organizes behavior
- Adapts to reality
- Solves problems

He said the Ego is not just fighting the Id, it also has healthy functions.

PART 12: ERNST KRIS

Follower of Freud.

He said:

The Ego controls regression.

Meaning:

The Ego decides when it is safe to act childlike and when it is not.

1. Who was Sigmund Freud and why is he important in psychology?

Answer:

Sigmund Freud (1856–1939) was an Austrian psychiatrist and the founder of psychoanalysis, a method of treating mental disorders by exploring the unconscious mind. He worked mainly in Vienna and later in England. Freud's ideas about the unconscious mind, personality structure, dreams, and defense mechanisms greatly influenced modern psychology and psychotherapy.

Explanation:

Freud noticed that people's behavior often reflected hidden thoughts and feelings they were not consciously aware of. He developed techniques to bring these unconscious thoughts into awareness to understand and treat psychological problems.

Example:

A person afraid of dogs without knowing why may have a forgotten traumatic experience with a dog. Freud's methods could help uncover and resolve this hidden fear.

Tips:

Remember Freud = "psychoanalysis + unconscious mind + dreams + defense mechanisms." Think of him as the detective of the mind.

2. What is the unconscious mind?

Answer:

The unconscious mind is the part of the mind that stores memories, desires, and feelings that a person is not aware of. According to Freud, it influences behavior, thoughts, and emotions, and can cause mental disorders if unresolved conflicts exist.

Explanation:

People often do not realize that hidden thoughts or past experiences affect their current behavior. These unconscious thoughts can appear in dreams, mistakes, or

emotional reactions.

Example:

A student who suddenly forgets an important deadline may be unconsciously avoiding a task that reminds them of past failures.

Tips:

Think of the unconscious like a “hidden basement” of your mind where old memories and feelings are stored.

3. What are the three parts of the mind according to Freud?

Answer:

Freud divided the mind into three parts:

1. **Id** – irrational, instinctual, seeks immediate pleasure.
2. **Ego** – rational, realistic, mediates between the Id and reality.
3. **Superego** – moral part, enforces rules and societal values.

Explanation:

- **Id:** You are born with it. It wants what feels good now.
- **Ego:** Develops as you realize the world has limits. It balances desire and reality.
- **Superego:** Develops last, learning rules from parents and society, creating feelings of guilt or pride.

Example:

- **Id:** A baby crying for milk.
- **Ego:** A teenager waits to eat cake until after dinner.
- **Superego:** Feeling guilty for lying or cheating.

Tips:

Think: “Id = wants, Ego = decides, Superego = should.”

4. What is the pleasure principle and reality principle?

Answer:

- **Pleasure principle:** The Id operates on this principle, seeking immediate gratification and avoiding pain.
- **Reality principle:** The Ego operates on this principle, delaying gratification and considering consequences in real life.

Explanation:

The pleasure principle is impulsive and emotional. The reality principle is rational and logical. Ego uses reality principle to negotiate between Id's desires and Superego's rules.

Example:

You want ice cream before dinner.

- Id: "I want it now!"
- Ego: "I will wait; eating it now will spoil my appetite and dinner."

Tips:

Pleasure = impulsive, Reality = thoughtful.

5. What is the Superego and what are its components?

Answer:

The Superego is the moral part of the mind that stores rules and values learned from parents and society. It has two parts:

- **Ego Ideal:** Standards for good behavior; what you should do.
- **Conscience:** Rules about what is bad; what to avoid.

Explanation:

The Superego constantly judges behavior, creating guilt for wrong actions and pride for good actions.

Example:

A child learns lying is bad. Later, the Superego will make them feel guilty if they lie.

Tips:

Superego = your internal "parent" or moral compass.

6. What are defense mechanisms?

Answer:

Defense mechanisms are unconscious strategies used by the Ego to protect itself from anxiety caused by conflicts between the Id, Superego, and reality.

Explanation:

They reduce stress and protect self-esteem by distorting reality or avoiding painful thoughts. Common defense mechanisms include repression, denial, regression, and projection.

Example:

- **Repression:** Forgetting a traumatic incident.
- **Denial:** Refusing to accept a bad grade.
- **Regression:** Acting childlike after a stressful event.
- **Projection:** Accusing someone else of your own jealousy.

Tips:

Think: defenses are "mind tricks" to feel safer and reduce stress.

7. What is neurosis according to Freud?

Answer:

Neurosis is a mental disorder caused by a combination of predisposition (a natural tendency) and trauma (an emotional shock).

Explanation:

People with a sensitive personality may develop anxiety, phobias, or other symptoms if they experience significant emotional trauma.

Example:

A person naturally anxious may develop a fear of driving after a car accident.

Tips:

Neurosis = "sensitive person + shock = mental struggle."

8. What are the main methods of psychoanalysis?

Answer:

Freud's psychoanalysis uses:

1. **Free association** – saying everything that comes to mind.
2. **Dream interpretation** – understanding hidden meanings in dreams.
3. **Analyzing slips and everyday mistakes** – discovering unconscious thoughts.
4. **Analysis of resistance** – noticing when patients avoid topics.
5. **Analysis of transference** – exploring feelings transferred onto the therapist.

Explanation:

These methods help uncover unconscious conflicts and bring insight to the patient.

Example:

A patient angry at their therapist may actually be redirecting anger toward a parent.

Tips:

Think of psychoanalysis like "exploring the hidden basement of the mind step by step."

9. Who was Anna Freud and what was her contribution?

Answer:

Anna Freud (1895–1982) was Sigmund Freud's daughter and a pioneer in **child psychoanalysis**. She studied how children develop defense mechanisms and how they cope with anxiety and aggression.

Explanation:

She developed techniques to understand and treat mental problems in children, such as identifying with the aggressor.

Example:

A bullied child may start bullying others, copying the aggressor to feel safer.

Tips:

Anna Freud = "child psychology + defense mechanisms in children."

10. Who were Heinz Hartmann and Ernst Kris, and what did they contribute?

Answer:

- **Heinz Hartmann (1894–1970):** Founder of **ego psychology**; focused on the Ego's role in organizing behavior and adapting to reality.
- **Ernst Kris:** Elaborated on the Ego's control over regression and coping mechanisms.

Explanation:

They extended Freud's work, emphasizing that the Ego is not just reactive but also has positive, adaptive functions.

Example:

The Ego helps a stressed adult act responsibly instead of regressing entirely into childlike behavior.

Tips:

Think: Hartmann = Ego's organizing power, Kris = Ego's control over stress reactions.

1. Who was Sigmund Freud and what is his significance in psychology?

Answer:**Sigmund Freud (1856–1939):**

- Austrian psychiatrist, medical doctor, researcher, writer, and professor.

- Founder of **psychoanalysis**, a method to understand and treat mental disorders by exploring the unconscious mind.

Education and Career:

- Born in Moravia; spent most life in Vienna.
- Received medical degree from University of Vienna in 1881.
- Early work involved **hypnotism**, influenced by Jean-Martin Charcot in Paris.
- Collaborated with Josef Breuer to treat **hysteria**, discovering the role of unconscious processes in mental illness.

Significance:

- Introduced the idea of the **unconscious mind** influencing thoughts, feelings, and behavior.
- Developed theories on personality, dreams, defense mechanisms, and childhood development.
- His work laid the foundation for modern psychotherapy and psychoanalysis.

Explanation (Plain English):

Freud noticed that many mental illnesses could not be explained by physical problems alone. He discovered that hidden thoughts, desires, and memories—the **unconscious mind**—play a major role in shaping our behavior. His approach was revolutionary because he tried to uncover what people do not consciously know about themselves.

Example:

A person afraid of dogs without knowing why may have been bitten as a child. Psychoanalysis helps uncover this hidden memory.

Tips:

Think of Freud as the “detective of the mind.” Key words: psychoanalysis, unconscious, dreams, defense mechanisms.

2. Explain Freud's structure of personality: Id, Ego, and Superego.

Answer:

Freud divided personality into three interacting parts:

Component	Description	Principle	Example
Id	Irrational, emotional, primitive part of the mind. Present at birth. Contains basic instincts and desires.	Pleasure Principle: seeks immediate gratification.	A baby crying for milk or a child grabbing candy.
Ego	Rational part, develops with experience. Mediates between Id and reality.	Reality Principle: delays gratification, considers consequences.	Waiting to eat cake until after dinner.
Superego	Moral part, develops last. Embodies societal and parental values.	Moral principle: strives for perfection and enforces rules.	Feeling guilty for lying or cheating; striving to meet parental expectations.

Subcomponents of Superego:

- **Ego Ideal:** Rules for good behavior; parental approval.
- **Conscience:** Rules for bad behavior; causes guilt when violated.

Explanation (Plain English):

- The **Id** wants everything now.
- The **Ego** negotiates what is realistic.
- The **Superego** tells us what is right or wrong.

These three parts interact constantly, and mental problems often arise when they are in conflict.

Example:

You want to eat cake before dinner (Id). You know it will spoil your appetite (Ego). Your parent told you it's bad to eat before meals (Superego).

Tips:

Remember: *Id = wants, Ego = decides, Superego = should.*

3. What are Freud's defense mechanisms? Explain with examples.

Answer:

Defense mechanisms: unconscious strategies by which the Ego protects itself from anxiety caused by conflict between the Id, Superego, and reality.

Common defense mechanisms:

1. **Repression** – Pushing threatening thoughts out of consciousness.
 - Example: Forgetting a traumatic childhood event.
2. **Denial** – Refusing to accept reality.
 - Example: A student ignoring a poor grade.
3. **Regression** – Returning to earlier, childlike behavior during stress.
 - Example: An adult crying like a child after a breakup.
4. **Projection** – Attributing one's own unacceptable impulses to others.
 - Example: A jealous person accusing their partner of jealousy.
5. **Rationalization** – Creating logical reasons to justify unacceptable behavior.
 - Example: Failing an exam and saying, "It was an unfair test anyway."

Explanation (Plain English):

Defense mechanisms are like "mental shields" that protect the Ego from anxiety. They distort reality so a person can cope with uncomfortable feelings.

Tips:

Think: *defense = mind protecting itself without conscious awareness.*

4. What is Freud's theory of neurosis?

Answer:

Neurosis: a mental disorder resulting from a combination of:

- **Predisposition:** natural sensitivity or tendency toward certain behaviors.
- **Trauma:** sudden emotional shock or stressful incident.

Formula:

Neurosis = Predisposition + Trauma

Explanation (Plain English):

People with sensitive personalities may develop anxiety, phobias, or other symptoms if they face sudden trauma. Neurosis is not a physical illness but a psychological response to stress and unresolved conflict.

Example:

A naturally anxious person may develop fear of driving after a car accident.

Tips:

Remember: "sensitive person + emotional shock = neurosis."

5. Describe Freud's psychoanalytic methods.

Answer:

Psychoanalysis is Freud's therapeutic method. Key procedures include:

1. **Free association:** Saying everything that comes to mind without censorship.
2. **Dream interpretation:** Analyzing latent content behind manifest content of dreams.
3. **Interpretation of everyday mistakes:** Slips of tongue, memory errors, etc., reveal unconscious thoughts.
4. **Analysis of resistance:** Observing avoidance of difficult topics.

5. **Analysis of transference:** Patient projects feelings toward therapist that are actually from someone in the past.

Explanation (Plain English):

These methods uncover unconscious conflicts causing mental distress. Dreams, mistakes, and projections are “windows” into hidden thoughts.

Example:

A patient angry at their therapist may actually be expressing unresolved anger toward their parent.

Tips:

Think: psychoanalysis = “exploring the hidden basement of the mind step by step.”

6. Who was Anna Freud and what were her contributions?

Answer:

Anna Freud (1895–1982):

- Sigmund Freud’s daughter and pioneer in **child psychoanalysis**.
- Specialized in understanding children’s mental processes and defense mechanisms.

Key contributions:

- **Identification with the aggressor:** Children mimic or adopt behavior of someone who dominates them to feel safe.
- Developed assessment and treatment methods for childhood anxiety and depression.

Example:

A bullied child starts bullying others to cope with fear.

Explanation (Plain English):

Anna Freud extended her father's work to children. She showed that children have defense mechanisms too, and these can explain both healthy and problematic behaviors.

Tips:

Anna Freud = "child psychology + defense mechanisms in children."

7. Who were Heinz Hartmann and Ernst Kris, and what did they contribute to psychoanalysis?

Answer:

Heinz Hartmann (1894–1970):

- Founder of **ego psychology**.
- Focused on how the Ego organizes human behavior, adapts to reality, and coordinates tendencies.
- Emphasized the Ego's **positive, adaptive functions**, not just its role in controlling the Id.

Ernst Kris:

- Elaborated on the Ego's role in controlling **regression** and managing stress.
- Studied how the Ego decides when childlike behavior is safe or necessary.

Explanation (Plain English):

They extended Freud's work by highlighting that the Ego is not just reactive. It actively helps people adapt, problem-solve, and cope with challenges.

Example:

A stressed adult uses rational thinking to solve a problem rather than giving in to impulsive desires or childlike reactions.

Tips:

Hartmann = Ego's organizing power.

Kris = Ego's control over regression and stress.

PART 1: SIMPLE MCQs

Q1. Sigmund Freud is best known as the founder of:

- A) Behaviorism
- B) Humanistic Psychology
- C) Psychoanalysis
- D) Cognitive Psychology

Answer: C) Psychoanalysis

Explanation: Freud invented psychoanalysis, a method of treating mental disorders through exploring the unconscious mind.

Q2. The Id operates according to the:

- A) Reality Principle
- B) Pleasure Principle
- C) Moral Principle
- D) Ego Ideal

Answer: B) Pleasure Principle

Explanation: The Id seeks immediate gratification and avoids discomfort, acting on the pleasure principle.

Q3. Which of the following is a subcomponent of the Superego?

- A) Id
- B) Ego Ideal
- C) Regression
- D) Free Association

Answer: B) Ego Ideal

Explanation: The Ego Ideal provides standards for good behavior and parental approval.

Q4. Repression is:

- A) Conscious lying to others
- B) Forgetting painful experiences unconsciously
- C) Acting childlike under stress
- D) Projecting impulses onto others

Answer: B) Forgetting painful experiences unconsciously

Explanation: Repression pushes threatening thoughts or memories out of awareness.

Q5. Neurosis, according to Freud, is caused by:

- A) Genetics alone
- B) Trauma alone
- C) Predisposition + Trauma
- D) Defense mechanisms

Answer: C) Predisposition + Trauma

Explanation: Neurosis results from a sensitive personality (predisposition) plus emotional shock (trauma).

PART 2: TRUE/FALSE MCQs

Q6. The Ego is present at birth and follows the pleasure principle.

Answer: False

Explanation: The Id is present at birth and follows the pleasure principle; the Ego develops later and follows the reality principle.

Q7. Freud believed dreams are a window to the unconscious mind.

Answer: True

Explanation: Dreams contain hidden meanings (latent content) that reflect unconscious desires.

Q8. Anna Freud specialized in adult psychoanalysis.

Answer: False

Explanation: Anna Freud specialized in **child psychoanalysis** and children's defense mechanisms.

Q9. Projection involves attributing one's unacceptable impulses to another person.

Answer: True

Explanation: Projection allows the Ego to defend itself by shifting blame or unwanted thoughts onto others.

Q10. The Superego is responsible for rational decision-making.

Answer: False

Explanation: The Ego is responsible for rational decisions; the Superego is the moral part, enforcing rules.

PART 3: CONCEPTUAL MCQs

Q11. Which of the following best describes the reality principle?

- A) Delaying gratification and considering long-term consequences
- B) Seeking immediate pleasure without regard for consequences
- C) Strictly following societal rules and norms
- D) Expressing unconscious desires in dreams

Answer: A) Delaying gratification and considering long-term consequences

Explanation: The Ego uses the reality principle to mediate between Id impulses and Superego moral demands.

Q12. "Identification with the aggressor" is a concept developed by:

- A) Sigmund Freud
- B) Anna Freud

C) Heinz Hartmann

D) Josef Breuer

Answer: B) Anna Freud

Explanation: Anna Freud observed that children adopt behaviors of dominant/aggressive individuals to cope with fear.

Q13. Which defense mechanism involves returning to earlier developmental behavior?

A) Denial

B) Regression

C) Rationalization

D) Projection

Answer: B) Regression

Explanation: Regression is reverting to childlike behavior under stress for comfort or security.

Q14. The Ego's function includes:

A) Mediating between Id and Superego

B) Following only the pleasure principle

C) Punishing bad behavior unconsciously

D) Repressing all traumatic memories

Answer: A) Mediating between Id and Superego

Explanation: The Ego balances desires (Id), moral rules (Superego), and reality constraints.

PART 4: SITUATIONAL MCQs

Q15. A student fails a difficult exam and says, "The test was unfair and the teacher is biased," even though they studied. Which defense mechanism is being used?

A) Repression

B) Rationalization

C) Projection

D) Denial

Answer: B) Rationalization

Explanation: Rationalization is creating logical excuses to justify undesirable outcomes and reduce anxiety.

Q16. A child who is scared of a strict older sibling starts bullying a younger sibling. This behavior illustrates:

A) Projection

B) Regression

C) Identification with the aggressor

D) Repression

Answer: C) Identification with the aggressor

Explanation: Anna Freud described that children sometimes adopt behaviors of threatening individuals to cope with fear.

Q17. A person forgets a traumatic car accident and has no memory of it but shows anxiety when near cars. This is an example of:

A) Denial

B) Repression

C) Regression

D) Sublimation

Answer: B) Repression

Explanation: Repression pushes threatening experiences out of conscious awareness while affecting behavior unconsciously.

Q18. A patient repeatedly calls their therapist by their parent's name and displays anger at them. This is an example of:

A) Transference

B) Free Association

- C) Projection
- D) Regression

Answer: A) Transference

Explanation: The patient projects feelings toward someone from their past onto the therapist.

Q19. A child refuses to admit they did something wrong but continues to behave as if it didn't happen. This defense mechanism is:

- A) Denial
- B) Rationalization
- C) Projection
- D) Regression

Answer: A) Denial

Explanation: Denial is refusing to accept reality even when conscious awareness exists.

Q20. The Ego is considered adaptive and responsible for healthy functioning because:

- A) It suppresses all Id desires permanently
- B) It organizes behavior and adapts to reality
- C) It punishes unconscious impulses
- D) It eliminates anxiety completely

Answer: B) It organizes behavior and adapts to reality

Explanation: According to Hartmann and Kris, the Ego is proactive, managing impulses and coping with life effectively.

SIGMUND FREUD CHEAT SHEET

1. Key Terms & Definitions

Term	Definition (Plain English)	Example / Tip
Psychoanalysis	A method to treat mental disorders by exploring the unconscious mind	Therapy using free association and dream analysis
Unconscious Mind	Part of mind storing hidden thoughts, desires, memories	Fear of dogs due to forgotten childhood bite
Id	Primitive, emotional, irrational part; seeks instant pleasure	Baby crying for milk; Pleasure Principle
Ego	Rational part; mediates between Id & reality	Teen waits to eat cake until after dinner; Reality Principle
Superego	Moral part; stores rules & values from parents/society	Feeling guilty for lying; has Ego Ideal & Conscience
Pleasure Principle	Desire for instant gratification	Id wants chocolate now
Reality Principle	Delay gratification and consider consequences	Ego waits to eat chocolate until dinner
Defense Mechanisms	Unconscious ways Ego protects from anxiety	Repression, Denial, Regression, Projection
Repression	Forgetting painful/threatening thoughts unconsciously	Forgetting a car accident
Denial	Refusing to accept reality	Refusing to acknowledge failing a class
Regression	Returning to earlier behavior	Crying like a child under stress
Projection	Attributing your unacceptable impulses to others	Accusing others of jealousy
Rationalization	Making logical excuses for mistakes	"Test was unfair" after failing
Neurosis	Mental disorder = Predisposition + Trauma	Anxiety develops after sudden shock
Transference	Projecting feelings from past onto therapist	Anger at therapist resembling anger at father
Free Association	Saying everything that comes to mind	"Mind dump" in therapy
Dream Analysis	Interpreting latent meaning behind dreams	Dream of journey = desire for change

2. Freud's Personality Structure – Table

Component	Principle	Function	Example	Mnemonic Hook
Id	Pleasure Principle	Wants instant gratification	Baby crying for milk	I = Instincts, Instant
Ego	Reality Principle	Mediates between Id & Superego	Waits to eat cake	E = Evaluate & Execute
Superego	Moral Principle	Enforces rules, creates guilt	Feeling guilty for lying	S = Standards

3. Psychoanalytic Development

Psychosexual Stages (Freud):

1. **Oral** (0–1 yr) – pleasure through mouth; e.g., sucking thumb
2. **Anal** (1–3 yrs) – pleasure via bowel/bladder control; e.g., toilet training
3. **Phallic** (3–6 yrs) – pleasure in genitals; Oedipus/Electra conflict
4. **Latency** (6–12 yrs) – sexual feelings dormant; learning & socialization
5. **Genital** (12+ yrs) – mature sexual interests

Memory Hook: “OAPLG” → **O**ral, **A**nal, **P**hallic, **L**atency, **G**enital

4. Defense Mechanisms – Table & Examples

Defense	Meaning	Example	Memory Hook / Mnemonic
Repression	Push away painful thoughts	Forgetting trauma	R = Remove from mind
Denial	Refuse reality	Ignoring bad grade	D = Don't accept
Regression	Return to childlike behavior	Crying under stress	R = Revert
Projection	Attribute own thoughts to others	Accusing partner of jealousy	P = Put it on someone else

Defense	Meaning	Example	Memory Hook / Mnemonic
Rationalization	Make excuses	"Test was unfair"	R = Reasoning falsely

Mnemonic for 5 common defenses: "RRR DP" → Repression, Regression, Rationalization, Denial, Projection

5. Key Figures Beyond Freud

Name	Contribution	Example / Tip
Anna Freud	Child psychoanalysis; defense mechanisms in children	<i>Identification with the aggressor</i> → bullied child becomes a bully
Heinz Hartmann	Ego Psychology; Ego as adaptive	Ego organizes behavior and adapts to reality
Ernst Kris	Ego controls regression	Ego decides when it is safe to act childlike

6. Psychoanalytic Methods

1. **Free Association:** Patient says everything that comes to mind → uncover unconscious thoughts
2. **Dream Interpretation:** Manifest content vs. latent content → uncover hidden meaning
3. **Interpretation of everyday mistakes:** Slips of tongue/memory reveal unconscious desires
4. **Analysis of Resistance:** Avoidance indicates underlying conflict
5. **Analysis of Transference:** Feelings toward therapist reveal past relationships

Memory Hook: "F-D-R-R-T" → Free, Dream, Real mistakes, Resistance, Transference

7. Quick Memory Mnemonics

- **Personality Structure:** I-E-S → Id, Ego, Superego → *I Want, I Decide, I Should*
 - **Defense Mechanisms:** R-R-R D-P → Repression, Regression, Rationalization, Denial, Projection
 - **Psychosexual Stages:** O-A-P-L-G → Oral, Anal, Phallic, Latency, Genital
 - **Psychoanalysis Methods:** F-D-R-R-T → Free, Dream, Real mistake, Resistance, Transference
-

8. Situational Examples

- **Scenario:** Student fails a test → says teacher is unfair → **Rationalization**
- **Scenario:** Adult stressed → starts crying → **Regression**
- **Scenario:** Child scared by bully → imitates bully → **Identification with aggressor**
- **Scenario:** Angry at parent → expresses anger at therapist → **Transference**
