Quiz Start Time: 01:43 PM, 22 May 2021
Question # 2 of 15 (Start time: 01:44:22 PM, 22 May 2021)
Total Marks: 1
Which of the following does not describe local alignment?
Select the correct option
A local alignment aligns a substring of the query sequence to a substring of the target sequence
A local alignment is defined by maximizing the alignment score, so that deleting a column from either end would reduce the score, and adding further columns at either end would also reduce the score
Local alignments have terminal gaps
The substrings to be examined may be all of one or both sequences; if all of both are included then the local alignment is also global

Which of the following is untrue about the Unweighted Pair Group Method Using Arithmetic Average?
Select the correct option
The simplest clustering method is UPGMA, which builds a tree by a sequential clustering method
Given a distance matrix, it starts by grouping two taxa with the largest pairwise distance in the distance matrix
The distances between this new composite taxon and all remaining taxa are calculated to create a reduced matrix
The grouping process is repeated and another newly reduced matrix is created

Which of the following is untrue about distance based methods?
Select the correct option
The computed evolutionary distances can be used to construct a matrix of distances between all individual pairs of taxa
Clustering is the only method among the algorithms for the distance-based tree-building method
The clustering-type algorithms compute a tree based on a distance matrix starting from the most similar sequence pairs
Based on the pairwise distance scores in the matrix, a phylogenetic tree can be constructed for all the taxa involved

Question # 14 of 15 (Start time: 02:57:50 PM, 22 May 2021)
Total Marks: 1
Which of the following is incorrect about Retrieving a Specific Sequence?
Select the correct option
It can be difficult to retrieve the sequence of a specific gene or protein simply because of the sheer number of sequences in the Gen-Bank database and the complex problem of indexing them
Other projects may benefit from the availability of better curated and annotated protein sequence databases, but not PIR and SwissProt
For projects that require the most currently available sequences, the NR databases should be searched
The genomic databases can also provide the sequence of a particular gene or protein. Protein sequences in the Genpro database are generated by automatic translation of DNA sequences.
