Zoology Legends

MCQS

- At one place on the surface is a minute opening or group of openings through the shell, called the **micropyle**.
- Commercial Products is **Shellac.**
- Commercial products are except

  1-Silk 2-Honey 3-Beeswax **4-Sugar**
- Measures for the artificial control of insects may be divided into _____groups: **Six**
- Climate in Natural control include _____**Humidity**
- Those of flies are called **maggots**

- Sometimes hairs from the body of the larva, held together by silk, form **most of the cocoon**
- The **parasites** that live in or on the different stages of other insects, then called **hosts**
- The **predators** that capture and devour other insects
- Insects which undergo complete Metamorphosis are called _____. **Holometabola**
- Insects have body segments_____**#3**

- Bombyx mori is the scientific name of **Silk**
- The… …extends from the mouth to the anus at the hinder end____**Alimentary canal**
- It passes over the stomach or other parts of the_____ **alimentary canal**
- Adults have hypognathous (directed **downward**) mouthparts and unique piercing– sucking larval jaws composed of the mandibles (directed **downward**) plus maxillae Insects benefits
- Mouth of neuropteran_____ **Downward**

- How many types of Artificial control of insects?_____ **6**
- Types of insect control_____**TWO**
- _____entirely absent in some insects__**Wings**
- **Two Pairs** of wing present in insect.
- Fleas are present all the united state aspect **Alaska.**
- Insects are present?

In water

Land

Both

None

- Those insects which nearly kill the other insects?

Parasite

Predator

- Lice is predator or **parasite**.?
- Insect which in used mainly in biological research?

Aphid

Fruit fly

Whips

- IPM stand for?

Integrated Management System

Zoo506 MCQS

1.Shellac is a commercial product.

2.Climate include..... humidity

3.....is insect-borne disease. Malaria, bubonic plague,typhiod, typhus, yellow fever

4.Parasites of many species attack.... Insects

5.Insect control is of.....2 types

6.Paurometabola means..... Metamorphosis

7.The alimentary canal extends from the mouth through about the center of the body to the anus at the hinder end.

8.Habitat of Diplopoda is.... on Land

9.....is a crustacean living on land. Watery

10.Small diplopods are sometime called as.....

Wireworm

11.Spines, hairs, scales or other structures are often present on the..... to entirely conceal its surface and its sutures. Margin of maxilla

11.Numerous.....are present on the tips and outer internal margins of the maxillae. Spines and hair

12.The organism in which a parasite live is called.... host

13.Organism that capture other insects called..... predator

14.Honey is a product..... Commercial

15.Natural control includes all except.....

16. Artificial control of insects includes all except,.....

17.Artificial control of insects may be divided into..... 6 groups .

18.Natural control fall those various factors which affect the distribution and welfare of insects.

19.IPM stands for..... Integrated pest management

20. Pesticide resistance in insect should be managed carefully using strategies such

application of pesticides with different modes of..... antiresistance strategies

21.Insects are responsible for a number of commercial products....

A third group of insects

22.All are the commercial products of insects except.... .4-sugar

23.Bombyx mori is the scientific name of.....

Silk worm

Short & Long

1) What is disease and example?

Any harmful deviation from the normal structural or functional state of an organism is called Disease.

Example: • Yellow Fever • Malaria

2) Commercial products of insects name (Both In Short & Long)

A third group of insects is responsible for a number of commercial products

υ Silk

υ Honey

υ Beeswax

υ Shellac

3) Natural control of insects

Under the heading of natural control fall those various factors which affect the distribution and welfare of insects. But do not depend upon man for their success

They include

(1) climate include:

a. Temperature, b. Humidity, c. Air movement

(2) Topography include a. Land and water barriers b. Soil, texture and composition

(3) Parasites and predators: Include insects and other animals

(4) Diseases caused by d. Fungi or bacteria, etc.

4) Physical control methods

The extremes of both temperature and humidity, either high or low, are not only effective barriers in the natural control of insects. But they are also useful in artificial control Light and electricity are other factors that come under this heading.

Physical Factor Controlling Insects

1- Heat
2- Cold
3- Moisture
4- Light
5- Electricity

5) Discuss artificial control Methods of insects

Measures for the artificial control of insects may be divided into six groups:

(1) mechanical control

(2) cultural control

(3) biological control,

(4) legislative control

(5) physical control

(6) chemical control.

6) Benefits of insects in details

Pollination

Some plants, as the Smyrna fig, clovers, melons, tomatoes, beans, peas and most of the common fruits, require the visits of insects before the seeds or fruits can form. Another highly important group of insects includes those which pollinate flowers during their visits for nectar and pollen, thus enabling the plants to produce

seeds The value of these crops which require the services of insects in the United States amounts to over two billion dollars

3-Commercial Products

A third group of insects is responsible for a number of commercial products

1-Silk

2-Honey

3-Beeswax

4-Shellac

4-Diet of certain birds, mammals

Insects provide the entire diet of certain birds, mammals, etc., and an important part of the diet for many others

5-Serve as Food

Even man in some parts of the world consumes large quantities of grasshoppers, crickets, ants and other insects

The great value of some insects and the great losses, sometimes enormous, caused by others make it obviously important to encourage the beneficial forms while striving to prevent or at least to reduce the losses caused by the injurious ones

7) Enlist plants pollinated by insects?

Some plants, as the Smyrna fig, clovers, melons, tomatoes, beans, peas and most of the common fruits, require the visits of insects before the seeds or fruits can form

8) Ovipositor?

At the end of the abdomen in the females of those insects which lay their eggs within objects is a combination of pieces known as an ovipositor.

Ovipositor usually consists of about three pairs of parts, long or short, slender or stout, as the case may be, for the purpose of making a hale or sawing a slit in the object in which the eggs are placed and in guiding the eggs into the hole thus made

In one group which has apparently changed its habits and no longer needs to make holes for egg laying, the ovipositor being unnecessary for this purpose has been transformed into a sting

9) How insect involve in pollination

Another highly important group of insects includes those which pollinate flowers during their visits for nectar and pollen, thus enabling the plants to produce seeds.

The value of these crops which require the services of insects in the United States amounts to over two billion dollars

10) How insects attack on injurious species

Reliable statistics are easily obtained relative to the production of useful insect products. Those insects which attack injurious species probably form the most important group

They are divided into two sections:

1-The parasites that live in or on the different stages of other insects, then called hosts

2-The predators that capture and devour other insects Parasites usually, though not always, live in or on a single host insect during their entire development

Whereas a single predator may derive its nourishment from many victim insects. Parasites are of many species, frequently so specialized in their habits that one kind of parasite attacks only one or a few host species In some cases the parasites work only in insect eggs and thus prevent any feeding loss by the host insect.

Other parasites attack early stages of the pests, in some instances killing them soon In others not until the pests have completed their feeding in spite of being parasitized. In the latter the benefit is less, but at least there are fewer adults to produce the next generation All stages are

known to be attacked in different species by one parasite or another

11) Name of different insect legs:

.Name the parts of legs in insect

- Coxa
- trochanter (two in a few cases)
- femur
- tibia
- tarsus

12) Coxa

The coxa is the segment that articulates with the body, frequently partly lying in a more or less cupshaped hollow of the latter. It may be short or long and is generally freely movable on the body and powerful

13) Difference between skeleton of Arthropods and Mollusks:

In the possession of this external skeleton these animals have a seeming resemblance to the shells (Mollusca) but the materials of which the skeleton is composed are quite different.

Being largely calcium carbonate in the Mollusca and chitin which somewhat resembles horn in its nature, sometimes with calcareous salts·deposited in it, in the Arthropoda.

The simple members of arthropod have bilaterally symmetrical body, though this condition is concealed somewhat by secondary changes in many of the group .The possession of a bilaterally symmetrical body consisting of a series of segments, an exoskeleton of chitin and the presence of jointed legs are, then, distinctive features of the arthropods .

Zoology Legends

To separate the various groups of arthropods, other characters must be Used Aside from several small sections not often seen, there are five large and important divisions which call for recognition
